FOREWORD

The Federal Power Act was originally enacted as the Federal Water Power Act, approved June 10, 1920 (41 Stat. 1063, 16 U.S.C. 791–823). The Federal Power Commission was reorganized January 1, 1931, as an independent Commission under the act approved June 23, 1930 (46 Stat. 797). By Title II of the Public Utility Act of 1935, approved August 26, 1935 (49 Stat. 838), the original Federal Water Power Act was made part I of the "Federal Power Act" and parts II and III were added. The Federal Power Act was amended May 28, 1948 (62 Stat. 275), August 7, 1953 (67 Stat. 461), August 15, 1953 (67 Stat. 587), June 4, 1956 (70 Stat. 226), and August 28, 1958 (72 Stat. 941 at 947). The Commission also administers the Natural Gas Act, approved June 21, 1938 (52 Stat. 821, 15 U.S.C. 717–717w), as amended February 7, 1942 (56 Stat. 83, 15 U.S.C. 717f), July 25, 1947 (61 Stat. 459, 15 U.S.C. 717f), March 27, 1954 (68 Stat. 36, 15 U.S.C. 717(c)), and August 28, 1958 (72 Stat. 941 at 947, 15 U.S.C. 717r), and has certain duties under the Tennessee Valley Authority Act, approved May 18, 1933 (48 Stat. 1075), and amendments thereto; the Bonneville Act, approved August 20, 1937 (50 Stat. 731); the Fort Peck Act, approved May 18, 1938 (52 Stat. 403); and under various Flood Control and River and Harbor Acts (notably the Flood Control Act of 1944, approved December 22, 1944 (58 Stat. 887)), and other statutes, as well as Executive Orders.

This volume, the thirty-fourth of a series, contains all the formal opinions and accompanying orders of the Federal Power Commission rendered, July 1, 1965 to December 31, 1965, inclusive. In addition to the formal opinions, there have been included intermediate decisions which have become final and selected orders of the Commission issued during such period.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CONSOLIDATED EDISON COMPANY OF NEW YORK, INC., PROJECT NO. 2338

ORDER DENYING APPLICATION FOR REHEARING AND PETITION TO REOPEN PROCEEDINGS

(Issued July 1, 1965)

On April 26, 1965, Scenic Hudson Preservation Conference (Scenic Hudson), Town of Cortlandt, Town of Putnam Valley, and Town of Yorktown, Interveners in this proceeding, filed joint motions (1) to transfer the scheduled hearing of May 4, 1965, from Washington, D.C. to New York City; (2) to provide for an adjourned hearing at which interested parties would have an opportunity to present evidence and to cross-examine Consolidated Edison; and (3) to expand the scope of the hearing (a) to include consideration of underground transmission, (b) to include consideration of certain legal rights relating to ordinances concerning regulation of underground transmission lines, and (c) to permit certain testimony with respect to fish life.

In our order issued April 30, 1965, on the petition of the Secretary of the Interior to intervene and his motion for prehearing conference and continuance of the hearing, we indicated that the examiner would determine in the light of the circumstances prevailing at the time of hearing, the order in which the issues would be heard, the nature, timing and place of presentation, and whether to grant a reasonable postponement for cross-examination and preparation of rebuttal testimony. For this reason, by our order of May 6, 1965, 33 FPC 964, we denied the motions to transfer and adjourn the hearing.

Pursuant to our order of April 30, the examiner, on May 4, 1965, permitted the participants to confer and approved an agenda suggested by them. In accordance with the schedule adopted at the suggestion of the participants, after the transmission evidence of Consolidated Edison and the staff was completed on May 6, 1965, all interveners on the transmission line issue were granted a week's continuance before putting on their rebuttal testimony. Scenic Hudson did not participate in the sessions devoted to transmission. It represented that two of its fish biologists would not be able to be in Washington the week of May 4, 1965, but that during the following week possibly all of its witnesses would be in Washington on other business. At the request of Scenic Hudson, cross-examination of the fish biologists and engineers called by Consolidated Edison and the Department of the Interior was deferred several days and biologists testifying on behalf of Scenic Hudson were not called until May 12, 1965.

The joint application for rehearing of our order of May 6, 1965, filed June 4, 1965, no longer concerns itself with such procedural matters as continuances, in view of the relief accorded by the presiding examiner to all participants at the hearing. The moving parties state, however, that they were precluded from introducing evidence with respect to comparative cost and reliability of overhead and underground power lines.

Our order of May 6, 1965 stated, with reference to the motion to expand the transmission line aspect of the hearings commencing May 4, 1965, that it was in effect an application for rehearing of our order of March 9, 1965, 33 FPC 428, issuing a license, in which we specifically defined the scope of the May 4 hearings. In our Opinion No. 452–A, also issued May 6, 1965, 33 FPC 965, we explained why rehearing of the order issuing a license should not be granted. Opinion No. 452–A outlined the reasons why the scope of the hearing should not be expanded.

312-270—69——4

Those reasons are incorporated herein by reference and are our reasons for denying the application for rehearing and the petition to reopen proceedings filed June 4, 1965.

The Commission finds:

The application for rehearing of order denying motions and the petition to reopen proceedings, filed June 4, 1965, present no fact or legal principle which would warrant any change or modification of our order of May 6, 1965.

The Commission orders:

The application for rehearing of order denying motions and the petition to reopen proceedings filed jointly by the Scenic Hudson Preservation Conference, the Town of Cortlandt, the Town of Putnam Valley and the Town of Yorktown, are hereby denied.

Commissioner Ross *dissenting* for the reasons stated in his dissent to Opinion No. 452.

Commissioner Bagge *not participating.*

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

HUMBLE OIL & REFINING COMPANY, DOCKET NO. G–9287, ET AL.; UNITED GAS PIPE LINE COMPANY, DOCKET NO. RP65–15

ORDER AMENDING PRIOR ORDER

(Issued July 1, 1965)

The Commission by order issued April 21, 1965, in *Humble Oil & Refining Co.*, Docket No. G–9287, *et al.*, 33 FPC 830, released portions of the refunds resulting from the settlement of Humble's rate proceedings in those dockets. Humble and the pipelines in the resale chain between Humble and the ultimate consumer, were directed by that order to defer the flow-through of refunds to those natural gas companies which were not specifically obligated by prior order of the Commission to flow through to their customers. The order further provided that if a natural gas company which otherwise would have received the deferred refund filed an agreement to flow through such amounts, we would direct the release of such amounts.

United Gas Pipe Line Company on May 3, 1965 filed an agreement to flow through the amounts attributable to purchases under Humble's Rate Schedule Nos. 123, 149 and 154 prior to January 1, 1963. The refund of these amounts by Humble to United had been deferred by the Commission's order. Accordingly it is appropriate that the refund attributable to the purchases under the aforementioned rate schedules be released to United for flow-through by it pursuant to paragraph (F) of the order issued April 21, 1965.

The Commission orders:

(A) Paragraph (B) of the order issued April 21, 1965, is amended by deleting subparagraph 2 and the funds are released for flow-through pursuant to Paragraph (F) of that order.

(B) The order of April 21, 1965, in all other respects shall remain in full force and effect.

Before Commissioners Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

AREA RATE PROCEEDING, ET AL. (SOUTHERN LOUISIANA AREA), DOCKET NO. AR61-2, ET AL.

ORDER DENYING INTERVENTION

(Issued July 2, 1965)*

On May 5, 1965, The Jupiter Corporation (Jupiter) filed a petition to intervene in the above-designated proceedings. The Commission staff filed an answer in opposition to Jupiter's petition on May 14, 1965, particularly with respect to its lack of timeliness.

By order issued February 18, 1963, Jupiter was deleted as a respondent in these proceedings. In that order we stated:

> As to The Jupiter Corporation (formerly Commonwealth Oil Corporation), it appears that this respondent performs transportation services, does not have any production in the area, and, therefore, it has been determined to delete it as a respondent herein.

Jupiter did not object at the time and has not objected since to the issuance of said order nor did it choose to petition to intervene prior to May 5, 1965. On December 5, 1962, we instituted an investigation of these transportation services, by order issued in Docket No. RI63-212, 28 FPC 942.

In weighing the contentions in the petition, the present posture of the proceeding must be considered. Following the filing of prepared direct and rebuttal evidence by all parties in December, 1963, and March, 1964, these proceedings have been in hearing before a Presiding Examiner since April, 1964. The hearings are now approaching the final phase. Clearly it would not be appropriate to permit any late intervention into the proceeding at this time unless the petitioning party could show that there are extraordinary circumstances which prevented a more timely application. Jupiter has made no such showing.

Jupiter's first contention is that when we removed it as a party respondent in the proceeding in our order of February 18, 1963, it "had no way of knowing at that time that such deletion of Jupiter as a party to that proceeding would be prejudicial to Jupiter." Since the alleged prejudice relates to the possibility that we might treat the type of operation Jupiter was engaged in as a transportation of natural gas in interstate commerce, rather than its production, there is clearly no point to this contention. For in instituting Docket No. RI63-212 on December 5, 1962, over two months earlier the Commission had expressly acted on the assumption that Jupiter was performing a transportation service for both Pure Oil under its Rate Schedule No. 7 and for Phillips Petroleum Corporation (Phillips) and Kerr-McGee Oil Industries, Inc. (Kerr-McGee) under its Rate Schedule No. 8, and there instituted an investigation to determine whether the "rates, charges, or classifications for or in connection with the transportation of natural gas by Jupiter, subject to the jurisdiction of the Commission * * * may be unjust, unreasonable, unduly discriminatory or preferential." (*The Jupiter Corporation*, 28 FPC 942, 943). Similarly, as indicated above, the order of February 18, 1963 in this proceeding, severed Jupiter because it appeared to be engaged in transportation activities rather than acting as a producer. Accordingly Jupiter's suggestion that it could not know until December 8, 1964 that the Commission proposed to treat Jupiter as a transporter where rates would be

*Reconsideration denied by order issued August 23, 1965, 34 FPC 562. Affirmed, *The Jupiter Corporation* v. *F.P.C.*, 362 F. 2d 92 (CA7-1966).

determined like other natural gas companies transporting gas in interstate commerce is totally without substance.

Commencing about December 16, 1964, Jupiter filed a series of applications and pleadings all calculated to delay the proceedings in Docket No. RI63–212. Among many other things Jupiter on March 10, 1965 sought to consolidate the proceeding in Docket No. RI63–212, with the area rate proceeding in AR61–2. This we denied on April 29, 1965, 33 FPC 901, pointing out *inter alia* that to the extent that Jupiter might believe that the area rates to be fixed in AR61–2 might be relevant to the issue as to Jupiter's rates in Docket No. RI63–212, it could introduce evidence as to this nature in Docket No. RI63–212, or so contend in its brief after hearing.

Jupiter suggests that there may have been evidence introduced into Docket No. AR61–2 which is inconsistent with its present theory that it is not providing jurisdictional transmission services with respect to either of the rate schedules referred to above it has long had on file with the Commission relating to the Pure and Phillips-Kerr-McGee sales. Assuming *arguendo* this to be the case, there is no issue in Docket No. AR61–2 relating to Jupiter's status and nothing we can or will determine therein can prejudice its argument in Docket No. RI63–212. To permit it to intervene in the area rate proceeding to introduce evidence or cross-examine with respect to its status would only serve to delay both proceedings. It will have a full opportunity to present its position in Docket No. RI63–212: it needs no more.

The Commission orders:

The petition to intervene filed by The Jupiter Corporation on May 5, 1965, is denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

COLORADO INTERSTATE GAS COMPANY, DOCKET NO. CP65–330

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 6, 1965)

On April 19, 1965, Colorado Interstate Gas Company (Applicant) filed in Docket No. CP65–330 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain facilities for the transportation and delivery of natural gas to Alamo Chemical Company (Alamo), all as more fully set forth in the application.

Applicant presently purchases natural gas at the wellhead in the Greenwood-Sparks area of Colorado and Kansas, gathers such gas and delivers it to its Morton County, Kansas Compressor Station. Under the instant proposal, Applicant will deliver approximately 71,000 Mcf of this gas per day on a firm basis to Alamo prior to delivery of such gas to its Morton County Compressor Station, pursuant to an agreement between the parties dated April 1, 1965. Alamo will process the gas for removal of helium and other liquifiable hydrocarbons at its proposed cryogenics plant to be located adjacent to Applicant's Morton County Compressor Station, and will return the residue gas to Applicant.

Deliveries of gas to Alamo will be made from Applicant's gathering system, and thus will not affect Applicant's peak day transmission system capacity. In

addition, Alamo agrees to redeliver to Applicant gas of at least the same average heating value as that delivered by Applicant to it, and further agrees to redeliver such gas at a pressure not less than that at which it is received. Approximately 10 percent of the volume of gas processed will be sold to Alamo as gas shrinkage and gas used in plant operations.

Applicant proposes to construct and operate tap and valve facilities in order to enable it to deliver gas to Alamo and accept redelivery of gas after processing. The total estimated cost of such facilities is $22,700, and will be financed with current working funds.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 1, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits thereto, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Colorado Interstate Gas Company, a Delaware corporation having its principal place of business in Colorado Springs, Colorado, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of June 5, 1945, in Docket No. G–294 (4 FPC 936).

(2) The proposed construction and operation of facilities and transportation and delivery of natural gas hereinbefore described, as more fully described in the application in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The proposed construction and operation of facilities and transportation and delivery of natural gas are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

The Commission orders:

(A) A certificate of public convenience and necessity is hereby issued to Applicant, Colorado Interstate Gas Company, authorizing the construction and operation of facilities and the transportation and delivery of natural gas hereinbefore described, as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation and the transportation and delivery of natural gas shall be undertaken, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations, within one year from the date on which this order issues.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

COLORADO INTERSTATE GAS COMPANY, DOCKET NO. CP65-341; WESTERN GAS SERVICE COMPANY, DOCKET NO. CP65-355

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 6, 1965)

On April 26, 1965, Colorado Interstate Gas Company (Colorado) filed in Docket No. CP65-341 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing it to construct and operate two meter stations on its Fourway-Kit Carson main transmission line and to sell and deliver for a period of two years natural gas to Western Gas Service Company (Western) for resale, all as more fully set forth in the application.

On May 6, 1965, Western Gas Service Company (Western) filed in Docket No. CP65-355 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of facilities to purchase natural gas from Colorado Interstate Gas Company (Colorado) from Colorado's main transmission line, all as more fully set forth in the application.

The proposed meter stations of Colorado, located in Sherman County, Texas, and in Cimarron County, Oklahoma, will be utilized by Colorado to deliver an aggregate maximum daily volume of 10,000 Mcf (1,150 Mcf on a firm basis) at a flat rate of 21.5 cents per Mcf under its proposed X-24 Rate Schedule. Western's first year requirement is estimated to be 576,840 Mcf (14.65 psia).

The estimated cost of the proposed facilities of Colorado is $20,295, and will be defrayed from current funds.

Western proposes to construct 1.095 miles of 4½-inch pipeline main to connect its present facilities to a new tap on Colorado's Fourway Kit Carson pipeline at Stratford, Texas, and a new tap on the same pipeline near Keyes, Oklahoma. Western states that these two new taps will provide gas for Western's new irrigation well customers in these areas. Temporary certificate was granted Western on May 11, 1965 for the 1.095 miles of pipelines connecting with Colorado's mainline at Stratford, Texas.

The cost of the new facilities of Western is estimated to be $10,400.

Western has agreed to purchase from Colorado up to a maximum of 10,000 Mcf per day over a two-year period and anticipates that it will require 576,840 Mcf during the first year. The letter agreement further provides that Western will take or pay for a minimum volume of 34,500 Mcf each month.

Colorado concurrently filed with its application in this docket Original Sheet Nos. 112-117 to its FPC Gas Tariff, Second Revised Volume No. 2, as its proposed X-24 Rate Schedule (letter agreement between Applicant and Western dated March 5, 1965).

The Commission on May 11, 1965, issued a temporary certificate authorizing Colorado to construct and operate metering facilities necessary to sell and deliver 10,000 Mcf of natural gas daily to Western, and accepted for filing Colorado's Original Sheet Nos. 112-117 to its FPC Gas Tariff Second Revised Volume No. 2, comprising its X-24 Rate Schedule, effective May 11, 1965.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the applications has been filed.

At a hearing held on July 1, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the

applications and exhibits, submitted in support of the authorizations, and upon consideration of the record,

The Commission finds:

(1) Colorado Interstate Gas Company, a Delaware corporation having its principal place of business in Colorado Springs, Colorado, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order issued June 5, 1945 in Docket No. G–294 (4 FPC 936).

(2) Western Gas Service Company, a Delaware corporation having its principal place of business in El Paso, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order issued October 9, 1963 in Docket No. CP63–308 (30 FPC 986).

(3) The proposed construction and operation of facilities and sale of natural gas, as hereinbefore described and as more fully described in the applications and exhibits in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(4) The aforesaid proposed construction and operation of facilities and sale of natural gas are required by the public convenience and necessity and certificates therefor should be issued as hereinafter ordered and conditioned.

(5) Colorado and Western are able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act, and the requirements, rules and regulations of the Commission thereunder.

(6) Public convenience and necessity require that the certificates issued hereinafter and the rights granted thereunder be conditioned upon Colorado's and Western's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (b), (c) (3), (c) (4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) Certificates of public convenience and necessity are hereby issued to Colorado and Western authorizing the construction and operation of facilities and the sale of natural gas as more fully described in the applications in this proceeding, subject to the jurisdiction of the Commission, upon the terms and conditions of this order.

(B) The certificates issued by paragraph (A) above and the rights granted thereunder are hereby conditioned upon Colorado's and Western's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (b), (c) (3), (c) (4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be completed and placed in actual operation and the transportation of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within 6 months from the date on which this order issues.

(D) The certificates issued to Colorado and Western by paragraph (A) above shall be limited to a period of two years following the date of the issuance of this order.

(E) The certificate issued hereby to Colorado is granted on the express condition that the interruptible service authorized herein shall be curtailed or interrupted to the extent required to meet existing or future contracted maximum delivery obligations of Colorado for firm service to its customers.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

NORTHERN NATURAL GAS COMPANY, DOCKET NO. CP65-363

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT

(Issued July 6, 1965)

On May 14, 1965, Northern Natural Gas Company (Applicant), filed in Docket No. CP65-363, an application pursuant to Section 7(b) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities, all as more fully set forth in the application.

Applicant proposes to abandon a measuring and regulating station in Dakota County, Minnesota, presently serving, through Applicant's Peoples Natural Gas Division (Peoples), the Joint Independent School District No. 191 (School District).

Peoples has entered into a sales agreement with Minneapolis Gas Company (Minneapolis) transferring certain natural gas distribution equipment and associated property, and assigning Peoples' gas service contract with School District to Minneapolis. Thus the facilities will no longer be useful to serve School District since Minneapolis proposes to construct a new measuring and regulating station for that purpose.

After due notice, no petition to intervene, notice of intervention, or protest to the granting of the application has been filed.

At a hearing held on July 1, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought, and upon consideration of the record,

The Commission finds:

(1) Applicant, Northern Natural Gas Company a Delaware corporation having its principal place of business in Omaha, Nebraska, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of April 6, 1943, Docket No. G-280 (3 FPC 967).

(2) The facilities proposed to be abandoned, as hereinbefore described and as more fully described in the application herein, are used in the transportation and sale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and such abandonment is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The proposed abandonment of the aforesaid facilities is permitted by the public convenience and necessity and approval thereof should be granted as hereinafter ordered.

The Commission orders:

(A) Permission for and approval of the abandonment of the facilities hereinbefore described, as more fully described in the application in this proceeding, are hereby granted to Applicant, Northern Natural Gas Company.

(B) Applicant shall advise the Commission of the date of abandonment of the facilities as authorized in paragraph (A) above within 10 days of such abandonment.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

COMMUNITY NATURAL GAS COMPANY, INC., DOCKET NO. CP64-302

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE AND DELIVERY OF NATURAL GAS

(Issued July 7, 1965)

Community Natural Gas Company, Inc., (Applicant) filed in Docket No. CP64-302, an application on June 17, 1964, an amendment on August 17 and supplements thereto on August 13 and September 24, 1964, pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Texas Gas Transmission Corporation (Texas Gas) to establish physical connection of its natural gas transmission facilities with the facilities proposed to be constructed by Applicant, and to sell and deliver natural gas to Applicant for resale and distribution in the Town of Worthington, Greene County, Indiana, all as more fully set forth in the application and supplements thereto.

Applicant proposes to construct and operate approximately 2.2 miles of 4-inch transmission line from Texas Gas' 12-inch transmission line to Worthington and the necessary distribution facilities within the town. The estimated total cost of the proposed facilities is $226,160 and will be financed by the issuance of $90,000 in stock and the sale of $136,000 of 20-year 6% first mortgage bonds.

Annual and maximum day requirements of Worthington for the initial three-year period are estimated to be as follows:

	(Mcf)		
	First year	Second year	Third year
Annual	49,917	54,778	59,937
Maximum day	444	490	538

and will be purchased by Applicant under Texas Gas' Rate Schedule SG-3.

An application filed by Indiana Natural Gas Corporation on August 17, 1960, in Docket No. CP61-45 seeking an order directing Texas Gas to establish physical connection of its transmission facilities with those proposed by Indiana Natural, and to sell and deliver natural gas to it for resale also in the Town of Worthington, Indiana, was withdrawn by Indiana Natural on May 21, 1965 (effective under Commission authorization on June 21, 1965).

On July 17, 1964, Respondent, Texas Gas filed an answer to the application and stated it has no objection to the rendering of the requested service providing Applicant's third year peak day requirement does not exceed 538 Mcf and an appropriate service agreement therefor is executed by the Applicant.

Due notice of the filing of the application and opportunity for hearing thereon has been given by publication in the Federal Register on October 24, 1964 (29 F.R. 14605). No protest, petition to intervene, notice of intervention, or request for hearing has been filed in this proceeding. The competitive application of Indiana Natural, noted above, has been withdrawn.

The Commission finds:

(1) The Respondent, Texas Gas Transmission Corporation, a Delaware corporation having its principal place of business in Owensboro, Kentucky, is a

"natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order dated March 30, 1948, in Docket No. G–855 (7 FPC 213).

(2) Applicant, Community Natural Gas Company, Inc., is a legal entity duly authorized to sell and distribute natural gas in the State of Indiana and has received the necessary local franchises to render the service proposed.

(3) It is necessary and desirable in the public interest to direct Texas Gas to establish physical connection of its transmission facilities with those proposed to be constructed and operated by Applicant, and to sell and deliver to Applicant under its appropriate rate schedule and a service agreement to be executed by Applicant with Texas Gas in accordance with the Commission's Regulations, up to 538 Mcf of natural gas per day for distribution and resale as hereinbefore described.

(4) The requirement that Texas Gas serve Applicant, as hereinafter ordered, will not (a) place an undue burden upon Texas Gas, (b) require Texas Gas to enlarge its transportation facilities or (c) impair Texas Gas' ability to render adequate service to its existing customers.

(5) Applicant should be prepared to receive natural gas from Texas Gas for distribution in the community of Worthington, Indiana, within one year from the date of the issuance of this order.

The Commission orders:

(A) Respondent, Texas Gas Transmission Corporation is directed to establish physical connection of its facilities with the facilities proposed to be constructed and operated by Applicant, as hereinbefore described and to sell and deliver up to 538 Mcf of natural gas per day to Applicant under a service agreement to be executed by Applicant with Texas Gas in accordance with the Commission's Regulations, for the transportation, distribution and resale as hereinbefore described. Such service shall be rendered pursuant to Texas Gas' presently filed appropriate rate schedule.

(B) Texas Gas shall report to the Commission the date of commencement of service to Applicant within 15 days after such service begins.

(C) Applicant shall be prepared to receive service from Texas Gas as directed herein within one year from the date of issuance of this order.

(D) Applicant shall submit proof that the Indiana Public Service Commission has approved its financial plan within 90 days after the date of the issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black

JAMES P. EVANS, JR., ET AL., DOCKET NO. RI60–237; UNITED GAS PIPE LINE COMPANY, DOCKET NO. RP65–15

ORDER RELEASING REFUNDS

(Issued July 7, 1965)

The Commission by order issued November 4, 1964[1] approved Evans' offer of settlement of a pending rate proceeding and ordered Evans to retain the refund to its customer (United Gas Pipe Line Company) pending further order. This retention was directed in keeping with our policy expressed in the order approv-

[1] "Order Accepting Offer of Settlement, Requiring Filing of Notice of Change, and Terminating Proceedings," *James P. Evans, Jr., et al.*, Docket No. RI60–237, 32 FPC 1269.

ing the Humble settlement [2] wherein we stated that it is "our duty to insure that the ultimate consumers of gas actually receive all of the benefits of our rate regulation to which they may be entitled," and that we were taking action "to assure that, within the limits of our jurisdictional reach, the refunds to be ordered actually flow to those parties legally and equitably entitled thereto.

Review of the flow-through obligations of Evans' pipeline customer, United Gas, shows that United Gas is obligated to flow-through the jurisdictional portion of the refund in this proceeding. All of the other pipelines in the resale chain are similarly obligated to flow-through all significant, jurisdictional amounts with the exception of Texas Eastern Transmission Corporation and Southern Natural Gas Company. Texas Eastern is obligated to flow-through the amounts received from United Gas which are attributable to purchases prior to June 15, 1961, but claims that it has no such obligation for subsequent periods. Southern claims the right to retain amounts attributable to purchases between December 31, 1962 and April 1, 1964. Accordingly, we hereinafter provide that United Gas shall defer the flow-through and retain those amounts which Texas Eastern and Southern claim they are not obligated to flow-through.

The Commission orders:

(A) James P. Evans, Jr., shall release and pay over to the United Gas Pipe Line Company within thirty days of this order the total amount assigned to United Gas as specified in Evans' refund report filed November 30, 1964, together with all interest earned on such amount while in deposit in savings accounts.

(B) United Gas with respect to the amounts received pursuant to Paragraph (A) above shall, pending further order of the Commission, retain and defer the flow-through of those portions which are attributable to purchases by:

1. Texas Eastern subsequent to June 14, 1961; and
2. Southern between December 31, 1962 and April 1, 1964.

(C) The amounts ordered to be retained pursuant to Paragraph (B) shall be retained by United Gas in accordance with the methods set forth in Paragraph (J) of the Commission's "Order Releasing Refunds in Part" issued April 21, 1965 in *Humble Oil & Refining Company*, Docket No. G-9287, *et al.*, 33 FPC 830.

(D) Except as specifically ordered to retain amounts and defer the flow-through to specified parties, each company shall flow-through the refunds received pursuant to this order and submit a report thereon in accordance with the applicable Commission orders governing its flow-through obligation.

(E) Where amounts have been retained pursuant to Paragraph (B) and the party which otherwise would have received such amounts is presently obligated to pass on such amounts by prior order of the Commission or will voluntarily assume the obligation to pass on such amounts, a report setting forth the details of such obligation or an agreement assuming obligation to pass on the refund shall be filed by such a party within ten days.

(F) Where any pipeline subject to the jurisdiction of this Commission receives a refund pursuant to this order and contrary to our conclusion that the jurisdictional portion thereof will flow-through to its customers, claims the right to retain such amounts, that pipeline shall report to the Commission within ten days of the date of this order the basis of such claim, and when the amount is received, that pipeline shall retain, in accordance with Paragraph (C), the amount in dispute subject to our further order.

---

[2] "Order Conditionally Approving Rate Settlement Proposal, Severing and Terminating Proceedings, and Prescribing Refunds," *Humble Oil & Refining Company*, Docket No. G-9287, *et al.*, issued July 8, 1964, 32 FPC 49.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

LANDS WITHDRAWN IN POWER SITE RESERVE NO. 8 AND PROJECT NO. 2273, DOCKET NO. DA-566-IDAHO, FRANK M. SOTIN

FINDINGS AND ORDER UNDER SECTION 24 OF THE FEDERAL POWER ACT

(Issued July 7, 1965)

Application (Idaho 013983) was filed by Frank M. Sotin (Applicant) of Lucile, Idaho, with the Boise Land Office of the Bureau of Land Management, for restoration to entry of the following-described lands of the United States withdrawn for power site purposes, thereby requiring Commission consideration under Section 24 of the Federal Power Act.

BOISE MERIDIAN, IDAHO

T. 25 N., R. 1 E., sec. 14: lot 8

It appears that Applicant is seeking to acquire the land upon which he has erected residential improvements. Applicant has filed his request to acquire the lands under the terms of the Unpatented Mining Claims Relief Act of October 23, 1962 (76 Stat. 1127).

The land is withdrawn in Power Site Reserve No. 8, dated July 2, 1910, and is also withdrawn pursuant to the filing on August 22, 1960, of an amended application for license for Nez Perce Project No. 2273.

The land lies on the east bank of the Salmon River about 79 miles upstream from its mouth at the Snake River and 2½ miles above the town of Lucile, Idaho. The land ranges in altitude from 1,625 feet at the river level to about 2,000 feet up the canyon wall.

Applicant's dwelling and appurtenant facilities now located on the subject lands are situated at approximately the 1,640-foot elevation which places the improvements well below the U.S. Corps of Engineers' suggested Freedom site flow line of 1,780 feet. The subject lands have power value which is protected by the aforesaid withdrawals.

The Commission finds:

Restoration to entry of the above-described lands would injure their power value.

The Commission orders:

The aforesaid application for restoration to entry of the above-described lands is denied.

Commissioners O'Connor and Ross *dissenting.*

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

THE MONTANA POWER COMPANY, PROJECT NO. 5

ORDER DENYING PETITION TO VACATE HEARING AND REQUEST FOR ORAL ARGUMENT AND DEFERRING ACTION ON PETITION TO DISMISS APPLICATION FOR READJUSTMENT OF ANNUAL CHARGES

(Issued July 7, 1965)

The Montana Power Company (Licensee), on April 14, 1965, filed a motion to dismiss an application by the Confederated Salish and Kootenai Tribes of the

Flathead Reservation (Confederated Tribes) for readjustment of annual charges for use of tribal lands after a period of twenty years of operation of the Kerr hydroelectric development, Project No. 5, under the license and Section 10(e) of the Federal Power Act, and to vacate the hearing ordered by the Commission's order of March 29, 1965, 33 FPC 647, which as modified, is now scheduled to be held on September 21, 1965.

The Licensee contends that if the Commission proceeds with the scheduled hearing, its rights under Article 30(D) of the license will be violated. Section 10(e) of the Water Power Act of 1920 under which the license was issued provided for readjustment of annual charges for use of Indian lands in a manner to be described in each license. Article 30(D) of the license for Project No. 5 provides for readjustment of annual charges by agreement between the Licensee and Commission with approval of the Secretary of the Interior, and in the event of disagreement provides for arbitration under the United States Arbitration Act (U.S.C., Title 9).

The Confederated Tribes filed a reply on April 15, 1965, opposing the motion of the Licensee, maintaining that the negotiation and arbitration of annual charges provided for in Article 30(D) are procedural, and that when in 1935 Section 10(e) was amended so as to provide for readjustment of annual charges by the Commission after notice and opportunity for hearing, the Licensee's substantive rights remained the same and that there had only been an alteration in the forum where recalculation would take place.

A request for oral argument was filed on June 4, 1965, by the Licensee for the reasons that the motion to dismiss the application for readjustment raises the issues of Commission jurisdiction, that this question should be determined before testimony on what the annual charges should be is taken, and that the question of jurisdiction is a legal question that can be determined without the necessity for a hearing.

The Montana Power Company raised these same issues by a petition seeking to enforce arbitration of the question of readjustment of annual charges for occupancy of Indian land under Article 30(D) of its license, which was filed on April 14, 1965, in the United States District Court for the District of Montana, Butte Division. That Court in its Order 1251, dated May 24, 1965, held that the question sought to be brought before it was one over which the Commission had exclusive jurisdiction in the proceeding in which a hearing was set by it in its order of March 29, 1965.

The Licensee takes the position that no readjustment of annual charges for occupancy of Indian land is necessary after twenty years of operation of the Kerr Project. The Commission's order of March 29, 1965 clearly states that it is not necessary to decide prior to a hearing whether readjustment is necessary, or whether the amount of readjusted annual charges, if any, is to be arrived at under Section 10(e) as amended in 1935, or in the manner described in Article 30(D):

> * * * Under either situation, the Commission would have to determine whether it believes any readjustment is appropriate and this determination, we believe, can be made only after an evidentiary hearing.

The point made by the Licensee in its request for oral argument that the issue involved arbitration is a legal issue which should be resolved by argument prior to a hearing was considered by the Commission in its order of March 29, 1965, as follows:

> * * * Since the latter question appears to be solely a matter of law, we do not contemplate that any evidence will be introduced thereon but the parties may, of course, argue the matter to the examiner and the Commission by way of a brief.

If the Licensee or any other party to the proceedings feels that argument by way of its brief is not sufficient, a request may be made under Section 1.29(b) or Section 1.31(d) of the Commission's Rules of Practice and Procedure for oral argument before the Presiding Examiner or before the Commission on exceptions to the decision of the Examiner.

The Commission finds:

The Licensee has not shown good cause for vacating the hearing now fixed for September 21, 1965, or for granting oral argument at this time.

The Commission orders:

The portion of the petition to vacate the hearing on this matter, and the request for oral argument at this stage of the proceedings are denied, and the portion of the petition to dismiss the application for readjustment of annual charges for use of Indian lands is deferred until further order of the Commission after a hearing.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

ORDER ESTABLISHING NATIONAL POWER SURVEY REGIONAL ADVISORY COMMITTEES

(Issued July 7, 1965)*

The Federal Power Commission is directed by Section 202(a) of the Federal Power Act (16 U.S.C. 792–825r) to promote and encourage voluntary interconnection and coordination of the nation's electric power facilities in the interest of economy and conservation, and is authorized by Section 311 of the Act to conduct broad investigations covering all aspects of the entire power industry. In order to accomplish more effectively the objectives of the National Power Survey, a report issued by the Commission in December 1964, and in accordance with the Executive Order 11007 of February 26, 1962 (27 F.R. 1875) relating to the Formation and Use of Advisory Committees, we have concluded that it is in the public interest that six National Power Survey Regional Committees, as listed below, be, and hereby are, established:

Northeast	East Central	West Central
Southeast	South Central	West

1. *Purpose.* The Regional Advisory Committees will assist the Commission in updating the guidelines of the National Power Survey, and in encouraging the utility systems in each Region to pursue courses of action consistent with them. The Committees will facilitate the exploration of all practicable opportunities for more efficient development and operation of power systems in each region. Meetings of the Committees will constitute forums for the exchange of ideas and for fostering better communication and understanding among all utilities of the region involved. All systems of every segment of the industry would be encouraged to support the analyses through an expression of their needs and desires. The Committees will be consultative only and they will operate within the limits established by the Commission and enunciated on many occasions, that the National Power Survey was not intended as a blueprint or as a means of compelling the construction of particular facilities.

2. *Selection of Committee Members.* All Committee members and alternates shall be selected by the Chairman of the Commission with the approval of the Commission.

---

*Published in the Federal Register on July 14, 1965 (30 F.R. 8868).

3. *Conduct of Meetings.* The Chairman of the Commission, or in his absence, the Acting Chairman, or any full-time employee of the Commission designated by the Chairman or Acting Chairman of the Commission, shall act as chairman of Committee meetings and shall be responsible for opening and conducting meetings and for adjourning meetings when, in his judgment, adjournment is in the public interest.

4. *Minutes.* The Chairman of the Commission having made a finding that maintenance of a verbatim transcript would be impracticable and not in the public interest, there shall be kept by the Secretary of each Committee, in lieu thereof, a record of persons present, a description of matters discussed and conclusions reached, and copies of all reports received, issued, or approved by each Committee.

5. *Secretary of the Committee.* The Chairman of the Commission shall appoint a Secretary of each Committee from the Commission staff who shall be responsible for preparing summary minutes of all Committee meetings, preparing agenda, notifying members of the meetings, and maintaining all records related to organization, membership and operations of each Committee. The Secretary or his alternate shall be present during all meetings and shall certify the accuracy of all minutes.

6. *Location and Time of Meetings.* The initial meeting of each Committee will convene at the call of the Chairman or Acting Chairman of the Commission at the Office of the Federal Power Commission, 441 G Street, NW., Washington, D.C., 20426. Subsequent meetings normally will be convened at the call of the appropriate Regional Engineer with meetings being held in the Commission's regional offices. Ordinarily, meetings will be held during the regular working hours of the Federal Power Commission.

7. *Report of the Committee.* The reports of the Committees will be presented to the Commission in written form. These reports, among other things, will outline the possibilities for meeting early goals for improvement in electric power supply, and will project longer range potential patterns for attaining major gains in the interest of the public welfare and economy of each region.

8. *Duration of the Committee.* Each Committee shall terminate not later than two years subsequent to its date of establishment, unless the Commission determines in writing, not more than 60 days prior to the expiration of such two-year period, that continued existence of the Committee is in the public interest. A like determination by the Commission shall be required not more than 60 days prior to the end of each subsequent two-year period to continue the existence of each Committee thereafter.

9. The Secretary of the Commission shall cause prompt publication of this order to be made in the Federal Register in accordance with the provisions of the Bureau of the Budget Circular No. A–63.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

NORTHERN NATURAL GAS COMPANY, DOCKET NO. CP65–344

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 7, 1965)

On April 28, 1965, Northern Natural Gas Company (Applicant) filed in Docket No. CP65–344 an application pursuant to Section 7(c) of the Natural Gas Act

for a certificate of public convenience and necessity authorizing the construction and operation of certain natural gas facilities and the sale and/or transportation and delivery of natural gas to existing customers, all as more fully set forth in the application in this proceeding.

Specifically, Applicant proposes to construct and operate 24 miles of 30-inch pipeline loop in northern Kansas and a 2,000 horsepower compressor unit addition at Ogden, Iowa. The total estimated cost of the project is $3,236,000, which cost will be financed from cash on hand, reserve accruals and retained earnings.

Applicant proposes an increase (decrease) in the contract demands of the following customers:

	Mcf
Town of Harlan, Iowa	400
Iowa Southern Utilities Company	70
Northern States Power Company	9,005
Peoples Natural Gas Division	7,700
Town of Remsen, Iowa	50
Superior Water, Light and Power Co	1,500
Town of Watertown, South Dakota	400
Iowa Power and Light Company	2,000
Metropolitan Utilities District	(2,000)
Total Increase	19,125

Applicant states that of the 400 Mcf increase requested by the Town of Harlan, 40 Mcf will be resold, on a firm basis, to an existing interruptible consumer, Western Iowa Pork, Inc. Superior Water, Light and Power Company's requested increase of 1,500 Mcf will be resold on a firm basis to Superior Fiber Products, Inc. Further, Applicant, through its Peoples Division, will sell an additional 7,700 Mcf of firm gas to Reserve Mining Company. Applicant also proposes to deliver, through its Peoples Division, an additional 100 Mcf of gas per day to Clinton Engines at Maquoketa, Iowa. This volume is to be delivered from amounts heretofore allocated to Peoples for its Billing Group 4B. The remaining 9885 Mcf of the requested 19,125 Mcf increase in contract demand is required to enable the above-listed customers to meet the necessary growth requirements for presently served communities.

A petition to intervene by Iowa Southern Utilities Company and a notice of intervention by the Public Service Commission of Wisconsin were filed herein. Neither the Wisconsin Commission nor Iowa Southern request formal hearing or object to the hearing and disposition of the subject application under the shortened procedure provided for by the Commissions' Rules. Inasmuch as the shortened procedure is being used herein, no further action on said petition or notice appears necessary.

After due notice, no other petition to intervene, other notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 1, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Northern Natural Gas Company, a Delaware corporation having its principal place of business in Omaha, Nebraska, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of April 6, 1943, in Docket No. G-280 (3 FPC 967).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the sale and/or transportation and delivery of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof and the proposed sales and/or transportation and delivery of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed sales and/or transportation and delivery of natural gas by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is hereby issued authorizing Applicant, Northern Natural Gas Company, to construct and operate the proposed facilities and to sell and/or transport and deliver natural gas as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation and the sales and/or transportation and delivery of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within 6 months from the date on which this order issues.

(D) This certificate shall not entitle the industrial customers to whom firm deliveries are authorized herein to any priorities to additional gas for meeting any future increases in their requirements at the expense of firm resale customers desiring to acquire additional gas to meet any future increases in their requirements.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

PUBLIC SERVICE COMPANY OF NEW HAMPSHIRE, NEW HAMPSHIRE ELECTRIC COMPANY AND KITTERY ELECTRIC LIGHT COMPANY, DOCKET NO. E-7220

ORDER AUTHORIZING ACQUISITION, MERGER OR CONSOLIDATION OF FACILITIES

(Issued July 8, 1965)

Public Service Company of New Hampshire (Public Service), New Hampshire Electric Company (New Hampshire), and Kittery Electric Light Company (Kit-

tery), filed a joint application with the Federal Power Commission on April 23, 1965, seeking an order pursuant to Section 203 of the Federal Power Act granting the necessary authority for the merger or consolidation of the facilities of New Hampshire and Kittery with the facilities of Public Service.

Public Service is incorporated under the laws of the State of New Hampshire, is qualified to do business in the States of New Hampshire, Maine and Vermont and owns and operates a single integrated system engaged in the generation, purchase and transmission of electric energy and its distribution and sale to the public in 10 cities and 180 communities in New Hampshire, to 9 communities in the State of Maine and 6 communities in the State of Vermont and the sale at wholesale to 10 electric utilities.

New Hampshire is incorporated under the laws of the State of New Hampshire and is qualified to do business in the State of New Hampshire and the State of Maine. It is a wholly-owned subsidiary of Public Service and owns transmission facilities connected to those of Public Service over which it sells electricity in interstate commerce to Kittery and to the Navy Yard in Kittery, Maine. It also serves the public in New Hampshire in the Counties of Cheshire, Hillsboro, Merrimack, Rockingham and Strafford.

Kittery, a wholly-owned subsidiary of New Hampshire is incorporated under the laws of the State of Maine and is qualified to do business in the State of Maine. It owns transmission and distribution facilities connected to the facilities of New Hampshire, over which it transmits and distributes in Maine electricity purchased from New Hampshire. Kittery also serves the public in the County of York in Maine.

According to the application, Kittery proposes to transfer all of its facilities and assets to New Hampshire in exchange for surrender by New Hampshire for cancellation of all the stock of Kittery which is held by New Hampshire and the assumption by New Hampshire of all the debts and obligations of Kittery. It is further proposed to transfer all facilities and assets of New Hampshire, including those acquired by New Hampshire from Kittery, to Public Service in exchange for surrender by Public Service for cancellation of all stock of New Hampshire which is held by Public Service, and the assumption by Public Service of all debts and obligations of New Hampshire, including those of Kittery assumed by New Hampshire.

Kittery proposes to transfer to New Hampshire all of its operating facilities used for the transmission and distribution of electricity and represents that the proposed use will be identical with the present use. New Hampshire proposes to transfer to Public Service all of its operating facilities used for generation, transmission and distribution of electricity including those acquired by it from Kittery and represents that the proposed use will be identical with the present use.

The following statement shows the utility plant accounts of Public Service, New Hampshire and Kittery before the mergers and of Public Service after the mergers:

	As of December 31, 1964			
	Before mergers			After mergers: Public Service
	Public Service	New Hampshire	Kittery	
Electric Utility Plant:				
Electric Plant in Service:				
Intangible Plant	$45,057	$1,654		$46,711
Steam Production Plant	60,668,657	2,910,629		63,579,286
Hydraulic Production Plant	18,108,756			18,108,756
Inter. Comb. Eng. Prod. Plant	430,294			430,294
Transmission Plant	31,879,816	2,201,295	$194,466	34,275,577
Distribution Plant	62,967,924	8,920,478	1,278,340	73,166,742
General Plant	3,371,435	408,083	24,787	3,804,305
Total	177,471,939	14,442,139	1,497,593	193,411,671
Construction Work in Progress	788,497	7,128		795,625
Held for Future Use	147,122			147,122
Total	178,407,558	14,449,267	1,497,593	194,354,418
Reserves Applicable to Utility Plant:				
Accumulated Provision for Depreciation of Electric Plant in Service	36,932,270	*3,957,260	344,357	*41,233,887
Other	58,339			58,339
Total	36,990,609	3,957,260	344,357	41,292,226
Net Plant	141,416,949	10,492,007	1,153,236	153,062,192

*Includes $240,616 transferred from Miscellaneous Operating Reserves.

The merger of Kittery into New Hampshire will not result in the creation of an acquisition adjustment on the books of New Hampshire, and the merger of New Hampshire into Public Service will not result in the creation of an acquisition adjustment on the books of Public Service.

According to the application, the proposed merger or consolidation of the three companies will not result in any change in control or service performed for the public. The electric facilities of the companies have been operated and will continue to be operated as a single integrated system by Public Service. The applicants state that the consolidation of three companies "* * * will simplify the intercorporate structure, will produce some economies in operation, will simplify future proceedings before various regulatory authorities and will reduce the number of reports required to be filed with regulatory authorities and other state and federal agencies."

Also, according to the application, Public Service proposes to make effective as of the date of transfer, throughout the territory in the States of New Hampshire and Maine presently being served by New Hampshire and Kittery, the standard electric tariff of Public Service then in effect in its service area in New Hampshire. The standard electric tariff for Public Service is and has been for some time identical with that of New Hampshire. Service under Public Service's tariff will have the effect of a rate reduction for the customers presently being served by Kittery.

Written notice of the application has been given to the Public Utilities Commission of Maine and the Public Utilities Commission of New Hampshire. Notice was also published in the Federal Register on May 22, 1965 (30 F.R. 6952), stating that any person desiring to be heard or to make any protest with reference to the application, should on or before June 1, 1965, file petitions or protests with the Federal Power Commission, Washington, D.C., 20426. No petition or protest or request to be heard in opposition to the granting of the application has been received. By order entered June 21, 1965, the Public Utilities Commission of New Hampshire approved the proposed transaction.

The Commission finds:

(1) Public Service, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act, subject to the jurisdiction of the Commission, as heretofore described and set forth in the Commission's order issued February 24, 1965, *In the Matter of Public Service Company of New Hampshire*, Docket No. E–7152 (33 FPC 317).

(2) New Hampshire, a corporation, owns and operates facilities for the transmission and sale at wholesale of electric energy which is generated in the State of New Hampshire and consumed in the State of Maine, all of which facilities are in addition to and do not include facilities used for the generation of electric energy facilities used in local distribution or only for the transmission of electric energy in interstate commerce, or facilities for the transmission of electric energy consumed wholly by the transmitter, and New Hampshire is, therefore, a public utility within the meaning of Section 203 of the Federal Power Act.

(3) Kittery, a corporation, owns and operates facilities for the transmission and sale at wholesale of electric energy which is generated in the State of New Hampshire and consumed in the State of Maine, all of which facilities are in addition to and do not include facilities used for the generation of electric energy facilities used in local distribution or only for the transmission of electric energy in interstate commerce, or facilities for the transmission of electric energy consumed wholly by the transmitter, and Kittery is, therefore, a public utility within the meaning of Section 203 of the Federal Power Act.

(4) By the proposed first step in the transaction, New Hampshire will merge or consolidate its facilities subject to the jurisdiction of the Commission with those of Kittery, another person, within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(5) By the proposed second step in the transaction, Public Service will merge or consolidate its facilities subject to the jurisdiction of the Commission with those of New Hampshire, another person, within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(6) The proposed acquisition of facilities by New Hampshire and the proposed acquisition of facilities by Public Service, as described above, upon the terms and conditions set forth in the application, and subject to the provisions of this order will be consistent with the public interest as expressed in Section 203 of the Federal Power Act.

(7) Neither Public Service nor New Hampshire is subject to a requirement of the Public Utility Holding Company Act of 1935 or of a rule, regulation, or order thereunder, which would exempt them or either of them, pursuant to Section 318 of the Federal Power Act from the requirements of Section 203 thereof with respect to any matter with which the order is concerned.

The Commission orders:

(A) The proposed acquisition by New Hampshire of the electric facilities of Kittery, all as described above, is authorized and approved upon the terms and conditions and for the purposes set forth in the application subject to the provisions of this order.

(B) The proposed acquisition by Public Service of the electric facilities of New Hampshire, all as described above, is authorized and approved upon the terms and conditions and for the purposes set forth in the application subject to the provisions of this order.

(C) New Hampshire and Public Service shall record the proposed transactions herein authorized and the facilities and properties referred to above as provided in the Commission's Uniform System of Accounts Prescribed for Public Utilities and Licensees.

(D) This authorization shall expire unless the transactions herein authorized and approved are consummated within 90 days from the date of issuance of this order.

(E) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuations, estimates or determinations of cost, or any matter whatsoever now pending or which may come before this Commission or any other regulatory body and nothing herein shall be construed as an acquiescence by this Commission in any estimate or determination of cost of any valuation of property claimed or asserted by this Commission.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CARNEGIE NATURAL GAS COMPANY, DOCKET NO. CP65-331

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY AND PERMITTING AND APPROVING ABANDONMENT OF FACILITIES

(Issued July 9, 1965)

On April 19, 1965, Carnegie Natural Gas Company (Applicant) filed in Docket No. CP65-331 an application, as supplemented May 24 and May 27, 1965, pursuant to Sections 7(b) and 7(c) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities and for a certificate of public convenience and necessity authorizing the construction and operation of certain other facilities, all as more fully set forth in the application.

Applicant proposes to construct and operate approximately 34.2 miles of 20-inch pipeline, together with necessary measuring and regulating facilities, extending from a point of connection with the facilities of Texas Eastern Transmission Corporation (Texas Eastern) in Greene County, Pennsylvania to Applicant's city gate near Pittsburgh, Pennsylvania. In addition, Applicant proposes to abandon 14.58 miles of 16-inch and 7-inch gathering pipeline extending in a direction generally north and east of Applicant's Waynesburg Compressor Station in Greene County, Pennsylvania. This line is old, of obsolete construction, and requires extensive maintenance for its continued operation.

The proposed 20-inch line will enable Applicant to meet the increased firm natural gas requirements of United States Steel Corporation (U.S. Steel), expected to total 45,000 Mcf per day by 1967. U.S. Steel will utilize this additional gas in the operation of its Homestead and Clairton Works, located in Allegheny County, Pennsylvania.

Applicant proposes to purchase the necessary additional volumes of gas from Texas Eastern, pursuant to an agreement between the parties dated April 14, 1965.

Total estimated cost of Applicant's proposed construction is $2,549,000, and will be financed with cash on hand and cash generated through operations.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 8, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits and supplements thereto, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Carnegie Natural Gas Company, a Pennsylvania corporation having its principal place of business in Munhall, Pennsylvania, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of August 3, 1943, in Docket No. G–263 (3 FPC 1052).

(2) The proposed construction and operation of facilities by Applicant are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The proposed construction and operation of facilities by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) The proposed abandonment of facilities by Applicant is permitted by the public convenience and necessity, and approval therefor should be granted as hereinafter ordered.

(6) The public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is hereby issued to Applicant, Carnegie Natural Gas Company, authorizing construction and operation of the facilities hereinbefore described, as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations, within one year from the date on which this order issues.

(D) Permission for and approval of the abandonment by Applicant of the facilities hereinbefore described, as more fully described in the application in this proceeding, are hereby granted.

(E) Applicant shall advise the Commission of the date of abandonment of said facilities within 10 days thereof.

(F) The certificate hereby issued to Applicant is conditioned upon Texas Eastern Transmission Corporation receiving appropriate authorization in Docket No. CP64–5 for the sale of the necessary additional volumes of natural gas to Applicant.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

BANGOR HYDRO-ELECTRIC COMPANY, PROJECT NO. 2403

ORDER DENYING APPLICATION FOR REHEARING

(Issued July 12, 1965)

On March 18, 1965, Bangor Hydro-Electric Company (Applicant) filed an application seeking rehearing on the Commission's February 18, 1965, 33 FPC 278, order granting a license to Applicant for its Veazie Project located on the Penobscot River, Penobscot County, Maine, Project No. 2403.[1] Applicant alleges that the Commission erred in establishing January 1, 1938, as the effective date of the license, and on rehearing requests that the Commission amend the license order to provide for a fifty-year license with April 1, 1962, as the effective date.

The Applicant's position is that:

> The Commission's decision to make the Veazie Project [license] become effective January 1, 1938 and a termination date of December 31, 1987, thereby granting an actual usable term of less than twenty-three years is unreasonable and constitutes an abuse of administrative discretion and unfairly discriminates against the license. Such action denies Hydro the right of due process under the Constitution of the United States and had reasonable weight been given to the circumstances surrounding Hydro's application for the license, later dates would have been selected (Application for Rehearing, p. 6).

Applicant suggests that the Commission's order is inconsistent with the policy with regard to backdating which we enunciated in *Public Service Company of New Hampshire* (*The Androscoggin case*), 27 FPC 830 (1962). Applicant contends that under *Androscoggin* the license should not be backdated to 1938 because the reach of the Penobscot River on which Applicant's Veazie Project is located was declared non-navigable by the Supreme Court in 1852, and was not specifically determined to be navigable until the date of the order in this case.

Applicant further contends that the construction of its Power House B in 1938 was not a sufficient reason for backdating the license to 1938 because this construction was not "significant" enough to come within the *Androscoggin* rule requiring backdating of licenses to the time of the construction of any improvements if such construction was subsequent to the 1935 enactment of Section 23(b) of the Federal Power Act.

We are of the opinion that the Applicant's contentions are grounded upon a misapprehension of this Commission's prior decisions and that this application for rehearing must be denied for the reasons set out below.

First. Applicant makes much of the fact that the reach of the Penobscot River on which its Veazie Project is located was declared by the Supreme Court to be non-navigable in the 1852 case of *Veazie* v. *Moor*, 55 U.S. 345. Because of this holding, Applicant contends that it was not unreasonable to assume that no license would be necessary for its project until such time as the Commission made a formal determination of navigability pursuant to the Federal Power Act. In our view, the *Veazie* decision on which Applicant relies has clearly been drained of force by *The Daniel Ball*, 77 U.S. 557 (1870); *The Montello*, 87 U.S. 430 (1874); and other cases defining "navigable waters" which were adopted in sub-section 3(8) of the Federal Power Act.

[1] By order issued April 14, 1965 we granted rehearing for further consideration.

Second. In 1938 Applicant commenced construction of Power House B at the Veazie project. It did so without filing a declaration of intention or an application for a license as required by Section 23(b) of the Act.

In making the license for Applicant's project effective as of January 1, 1938 the Commission followed its uniform policy where project works were constructed after the 1935 amendment to the Act. As the Commission observed in *Androscoggin* (27 FPC at 832, note 2):

> The construction of any project work *subsequent* to the enactment of Section 23(b) of the Act of 1935 without the concurrent filing of a license application or declaration of intention plainly violates that section. There is little room for dispute that licenses for such project should be made effective not later than the date of construction of such project works.

In an order issued September 11, 1964 denying an application for rehearing filed by Central Maine Power Company in Project No. 2335, we refused to depart from this consistent policy of the Commission (32 FPC 733). Our disposition of that case was recently upheld by the United States Court of Appeals for the First Circuit. *Central Maine Power Company* v. *F.P.C.*, 345 F. 2d 875 (1st Circ., May 18 ,1965). In its opinion the court referred to that part of Section 23(b) which is quoted above and said:

> It must be that, at the very least, this portion of the statute was directed toward the doctrine embodied in such cases as *United States* v. *Rio Grande Dam and Irrigation Co.*, 1899, 174 U.S. 690, that Congress had a legitimate interest in non-navigable waters the diversion or impeding of which could affect navigation in navigable waters. * * * Under Section 23(b) if the location is one where injury could be done, it is for the Commission to make the decision as to whether "the interest of interstate or foreign commerce would be affected by such proposed construction." So viewed, we cannot possibly condemn the Commission's determination that petitioner was unreasonable, if not even recalcitrant in not recognizing and complying with the second portion of the statute by filing a declaration of intention.

Third. The Applicant contends that the 1938 construction of its Power House B is not a sufficient reason, under the Androscoggin decision, to justify backdating the license to 1938 because, says Applicant, this construction was not "significant". The construction and operation of Power House B, with a nameplate rating of 3,000 kw, is not insignificant where as here the total generating capacity of the entire project is only 8,400 kw.

The Commission further finds:

The assignments of error and grounds for rehearing set forth in the application for rehearing filed by Applicant on March 18, 1965, of the Commission's order issued herein on February 18, 1965, present no facts or principles of law which were not considered by the Commission when it issued its aforesaid order, or which having now been considered warrant any change or modification of the said order.

The Commission orders:

Bangor Hydro-Electric Company's application filed on March 18, 1965 for rehearing of the Commission's order issued February 18, 1965 in Project No. 2403 is denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CAROLINA POWER & LIGHT COMPANY, PROJECT NO. 2206; YADKIN, INC., PROJECT NO. 2197

ORDER APPROVING HEADWATER BENEFITS SETTLEMENT

(Issued July 12, 1965)

This order determines, under subsection 10(f) of the Federal Power Act (16 U.S.C. 803(e)), that the United States' W. Scott Kerr development in the Yadkin-Pee Dee river basin does not provide any significant headwater benefits to the downstream Project No. 2197 of Yadkin, Inc. (Yadkin), and Project No. 2206 of the Carolina Power & Light Company (Carolina Power). The order also approves, pursuant to Section 13.1 of the Regulations under the Federal Power Act in lieu of a headwater benefits determination under subsection 10(f) of the Act, agreements between Yadkin and Carolina Power concerning compensation for headwater benefits provided by Yadkin's Project No. 2197 to Carolina Power's downstream Project No. 2206.

Yadkin's Project No. 2197 consists of the High Rock, Tuckertown, Narrows, and Falls developments, and Carolina Power's Project 2206 consists of the Tillery and Blewett Falls developments.

Preliminary investigation indicates that any headwater benefits which the United States' W. Scott Kerr project might provide to Yadkin's Project No. 2197 and Carolina Power's Project No. 2206 are *de minimis*.

On September 23, 1963, Yadkin filed a contract dated February 19, 1926, between its predecessor, Tallassee Power Company (Tallassee), and Carolina Power. This contract provides that Tallassee will construct the High Rock reservoir and operate it and Tallassee's Narrows reservoir to impound and subsequently release the flood waters of the Yadkin River in such a way that the river flow will be equalized throughout the year to the end that during each calendar year the minimum flow will be sustained at the highest practicable amount. The contract provides, also, for the storage of energy in equivalent amounts of water by Carolina Power in the High Rock and Narrows reservoirs when storage is available in the High Rock and Narrows reservoirs. Carolina Power agrees to pay Tallassee annually the sum of $100,000 for the benefits from stream flow regulation by these reservoirs. The contract continues in force until December 31, 1967, and thereafter until terminated by mutual consent of the parties, but in no event longer than 99 years from January 1, 1968. By a letter agreement dated January 26, 1956, Yadkin and Carolina Power stipulated that the payments provided in the contract of February 19, 1926, are deemed to cover any benefits which might be provided by Yadkin's Tuckertown development to Carolina Power's Project No. 2206.

The Commission finds:

(1) The United States' W. Scott Kerr development does not confer any significant headwater benefits upon the downstream Project No. 2197 of Yadkin, Inc. and Project No. 2206 of the Carolina Power & Light Company.

(2) The agreements dated February 19, 1926, and January 26, 1956, between Yadkin, Inc., or its predecessor Tallassee Power Company on the one hand and South Carolina Power & Light Company on the other constitute an effective and reasonable method of compensation for headwater benefits provided by Yadkin's Project No. 2197 to Carolina Power's Project No. 2206 in the Yadkin-Pee Dee river basin in North Carolina.

The Commission orders:

The agreements dated February 19, 1926, and January 26, 1956, between Yadkin, Inc., or its predecessor Tallassee Power Company on the one hand and Carolina Power & Light Company on the other are approved with respect to settlement of headwater benefits under Section 13.1 of the Regulations under the Federal Power Act in lieu of a headwater benefits determination under subsection 10(f) of the Federal Power Act until a further order of the Commission is required by changes in conditions.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

KANSAS-COLORADO UTILITIES, INC., DOCKET NO. G–2138; COLORADO INTERSTATE GAS COMPANY, DOCKET NO. CP61–256

FINDINGS AND ORDER AMENDING ORDERS DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE AND DELIVERY OF NATURAL GAS AND ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 12, 1965)

On April 12, 1965, Colorado Interstate Gas Company (Applicant) filed in Docket Nos. G–2138 and CP61–256 an application to amend the Commission's orders issued October 5, 1953, 12 FPC 750, in the former docket, and June 30, 1961, 25 FPC 1304, in the latter docket, to delete from such orders certain limitations contained therein upon the sale and delivery of natural gas to Kansas-Colorado Utilities, Inc. (Kansas-Colorado), all as more fully set forth in the application to amend in this proceeding.

In Docket No. G–2138 Applicant was directed to establish physical connection of its transmission facilities with the facilities of Kansas-Colorado and to sell and deliver up to 500,000 Mcf of natural gas per year through the delivery point at McClave, Colorado. Deliveries were limited to the months of May, June, July, August, September and October of each year. In Docket No. CP61–256, Applicant was authorized to add a new Springfield, Colorado delivery point at which it could deliver part of this gas to Kansas-Colorado. Deliveries under both authorizations are interruptible.

Applicant now requests that the orders in these dockets be amended to delete therefrom the above-described volume and seasonal limitations and that it be authorized to sell and deliver gas at the Springfield and McClave delivery points on both firm and interruptible bases and at any time throughout the year. Applicant has entered into a service agreement with Kansas-Colorado, dated April 7, 1965, reflecting the instant proposals and providing for service under Applicant's FPC Gas Rate Schedules P–1 and IS–2. Pursuant to said agreement Applicant can deliver up to 5,000 Mcf per day of combined firm and interruptible volumes at either or both the McClave and Springfield delivery points.

Applicant requests these modifications since, due to drought conditions in the subject service area during the past few years, Kansas-Colorado's irrigation customers have begun taking gas in larger quantities and at earlier dates than they had previously been doing.

On April 15, 1965, Applicant was issued a temporary certificate in this proceeding.

Due notice of the filing of the application to amend and opportunity for hearing thereon has been given by publication in the Federal Register on April 24, 1965 (30 F.R. 5805). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the Commission's orders issued October 5, 1953, and June 30, 1961, in Docket Nos. G–2138 and CP61–256, respectively, be amended as hereinafter ordered.

The Commission orders:

(A) The Commission's orders issued October 5, 1953, in Docket No. G–2138 is hereby amended to delete the volume limitation of 500,000 Mcf on the sale of gas to Kansas-Colorado authorized therein and, further, to delete the limitation restricting said sale to May, June, July, August, September and October of each year, all as hereinbefore described and as set forth in the application to amend.

(B) The Commission's order issued June 30, 1961, in Docket No. CP61–256 is hereby amended to delete the limitation restricting the sale of gas to Kansas-Colorado authorized therein to May, June, July, August, September and October of each year, all as hereinbefore described and as set forth in the application to amend.

(C) Applicant shall sell and deliver up to 5,000 Mcf per day of combined firm and interruptible volumes under its FPC Gas Rate Schedules P–1 and IS–2 to Kansas-Colorado at either or both the McClave and Springfield delivery points, as set forth in a service agreement dated April 7, 1965, entered into by Applicant and Kansas-Colorado.

(D) In all other respects said orders shall remain in full force and effect.

OPINION NO. 465

RUMFORD FALLS POWER COMPANY, PROJECT NO. 2333

MEMORANDUM OPINION AND ORDER DENYING APPLICATION FOR REHEARING

(Issued July 12, 1965)*

Syllabus

1. It is well established that authority to condition licenses is based on principle that applicant is not entitled as matter of right to construct, operate and maintain project works affecting navigable waters of the United States or interstate commerce. P. 28.
2. Power to grant or deny privilege of project license includes power to impose such terms or conditions as may be required in public interest. P. 28.
3. Issuance of license can be justified only on theory of a resulting benefit to public. P. 29.
4. It is appropriate that Commission reserve authority to require joint use of project works or parts thereof for water supply purposes [as in other instances] to protect public interest. P. 29.
5. When and if authority reserved by Article 31 is invoked, burden if any would only be imposed after notice and opportunity for hearing and necessary factual determinations made at that time. P. 29.
6. It is not arbitrary, unreasonable or a deprivation of due process to refrain from making findings as to what conditions may be in the future, at least where no present burden is concerned. PP. 29, 30.

---

*Remanded or clarification of Article 31, 355 F. 2d 683 (CA1–1966).

7. Commission *denies* applicant's request for rehearing with respect to inclusion of Article 31 in license.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

On June 11, 1965, Rumford Falls Power Company (Rumford Falls) of Rumford, Maine, filed an application for rehearing of our order of May 14, 1965, 33 FPC 1016, issuing a license for its constructed Project No. 2333 on the Androscoggin River. Applicant objects to Article 31[1] in the license order and requests that the Commission delete such article, ordering a hearing, and grant such other relief as may be just and proper.

By our order issued April 7, 1965 (30 F.R. 4769), 33 FPC 711, we terminated the rulemaking proceeding in Docket No. R–249 and provided that the substance of the proposed regulation, with certain modifications not pertinent here, would be inserted in licenses issued in the future as a specific license condition. The condition set out in Appendix A to that order is incorporated as Article 31 of the license order in Project No. 2333.

Rumford Falls urges that the inclusion of Article 31 in the license is contrary to law and beyond the jurisdiction of the Commission and that it is unreasonable and arbitrary and a denial of due process. We find no merit in these contentions.

It is well established that the authority to condition licenses is based upon the principle that an applicant is not entitled as a matter of right to construct, operate and maintain project works affecting navigable waters of the United States or interstate commerce. The power to grant or deny the privilege of a project license includes also the power to impose such terms and conditions as may be required in the public interest. *United States* v. *Appalachian Power Company*, 311 U.S. 377.

The inclusion of Article 31 of the license is entirely in accord with the provisions of the Federal Power Act. Section 10 of the Act provides that licenses issued under that Part shall be granted only on certain conditions, among which is that the project shall be in the judgment of the Commission best adapted to a comprehensive plan of development (Section 10(a))[2] and "such other conditions

[1] *Article 31.* On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply for steam-electric, irrigation, industrial, municipal or similar purposes, consistent with the primary objective of the project. The Licensee shall receive such reasonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

[2] Section 10(a) provides in full as follows:

All licenses issued under this Part shall be on the following conditions:

(a) That the project adopted, including the maps, plans and specifications, shall be such as in the judgment of the Commission will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of waterpower development, and for other beneficial public uses, including recreational purposes; and if necessary in order to secure such plan the Commission shall have authority to require the modification of any project and of the plans and specifications of the project works before approval.

not inconsistent with the provisions of this Act as the Commission may require" (Section 10(g)).[3]

Section 7(a), for example, provides for preference for applicants whose plans are deemed to be best adapted to develop, conserve and utilize in the public interest the water resources of the region. See also Section 4(g) pertaining to conservation and utilization of navigation and water-power resources. Section 6 provides in part that each license shall be conditioned upon acceptance by the licensee of all the terms and conditions of the Act and such further conditions if any as the Commission shall prescribe in conformity with the Act.

Thus the view which Rumford Falls apparently takes as to our authority, and responsibility, under the Federal Power Act is entirely too narrow. See, *e.g.*, *Federal Power Commission* v. *Idaho Power Company*, 344 U.S. 17, 23. Issuance of a license can be justified only on the theory of a resulting benefit to the public. *Alabama Power Company* v. *Federal Power Commission*, 128 F. 2d 280, 288–89 (CADC), quoted with approval in *California* v. *Federal Power Commission*, 345 F. 2d 917, CA9 No. 19,394, decided May 18, 1965.[4]

Future multiple purpose use of Rumford Falls' project works is by no means an unreasonable expectation. The application for license for Project No. 2333 recites, at pp. 3–4:

> The Commission must be aware that on the Androscoggin River there exist many dams * * *. These dams have been constructed for various purposes, several of them and their predecessors for over 100 years. They have been operated for log driving, storage of water, merchanical and electric power. They have been utilized for the corporate purposes of utility companies, industry, and the public purposes of at least one municipality.

Moreover, the application for license as well as the application for rehearing shows that there is to some extent a present multiple purpose use of project works to supply water for industrial processing. We note there is reported considerable pollution of the Androscoggin River and, as set out in the comments of the Secretary of the Interior on Rumford Falls' application for license, this condition is expected to change, as will others in the future. It is generally anticipated that even greater demands than at present will be placed upon the nation's water resources in the future.

It is thus appropriate that we reserve authority to require joint use of project works or parts thereof for water supply purposes as we have reserved authority in other instances to protect the public interest. See, *e.g.*, *Pacific Power & Light Company* v. *Federal Power Commission*, 333 F. 2d 689, 691 (CA9), cert. denied, 33 U.S.L.W. 3245; *Idaho Power Company* v. *Federal Power Commission*, 346 F. 2d 956, CA9 No. 19,637, decided June 4, 1965. When and if the authority reserved by Article 31 is invoked in the future, the burden if any would be imposed only after notice and opportunity for hearing and necessary factual determinations made at that time. Rumford Falls requests a hearing but does not set out any relevant factual matters to be shown at such a hearing. In our view there is nothing to be heard at the present time. It is not arbitrary, unreasonable or a deprivation of due process to refrain from making findings as to

[3] Rumford Falls urges that Article 31 is violative of Section 10(g); we cannot agree to this narrow construction. See *Metropolitan Edison Company* v. *Federal Power Commission*, 169 F. 2d 719, 723 (CA 3).

[4] Rumford Falls also urges that imposition of Article 31 is contrary to Section 27 of the Federal Power Act. With respect to the protection of vested rights afforded by Section 27, we have provided that necessary water rights must be acquired pursuant to applicable state law and also that there be submitted a statement as to the relationship of the proposed use to any State or municipal plans which may have been adopted concerning the use of such waters.

what conditions may be in the future, at least where no present burden is imposed. *Portland General Electric Company* v. *Federal Power Commission*, 328 F. 2d 165, 175 (CA9).

The Commission finds:

The assignments of error or grounds for rehearing set forth in the application for rehearing filed on June 11, 1965, by Rumford Falls Power Company present no new facts or principles of law which were not considered by the Commission when it issued the Order Issuing License for Project No. 2333 on May 14, 1965, or which having now been considered warrant any change or modifications of said order.

The Commission orders:

The application for rehearing referred to above is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOCONY MOBIL OIL COMPANY, INC., DOCKET NOS. G–12201 AND G–17526; TRANSCONTINENTAL GAS PIPE LINE CORPORATION, DOCKET NO. RP65–31

ORDER ACCEPTING OFFER OF SETTLEMENT, SEVERING AND TERMINATING PROCEEDINGS, AND PRESCRIBING REFUNDS

(Issued July 12, 1965)

By order issued May 5, 1964, in Docket No. G–12193, *et al.*, 31 FPC 1101, we approved a general rate settlement proposal of Socony Mobil Oil Company, Inc. (Socony) for most of its jurisdictional sales of natural gas, including a partial settlement of the issues in Docket Nos. G–12201 and G–17526 relating to Socony's FPC Gas Rate Schedule No. 16 for its sales to Transcontinental Gas Pipe Line Corporation (Transco) from the West Gueydan Field in South Louisiana. In the settlement order, we accepted a settlement rate of 17.0¢ per Mcf for this rate schedule effective as of April 1, 1964, in lieu of 23.55¢ per Mcf rate collected subject to refund in Docket No. G–17526, and provided for a moratorium on the filing for increased rates under said rate schedule; however, we noted that the matters relating to refund obligations and to the termination of the proceeding in Docket Nos. G–12201 and G–17526 were excluded from the settlement proposal.

On May 27, 1965, Socony submitted a settlement proposal seeking to resolve the remaining issues in Docket Nos. G–12201 and G–17526. Under the instant offer, Socony proposes to refund approximately $750,000, inclusive of interest, to Transco. This refund is the amount collected above the 17.0¢ per Mcf settlement rate from March 29, 1961 to April 1, 1964, the effective date of the settlement rate. Additionally, Socony proposes to amend its contract with Transco for this sale to (1) provide for a five calendar year make-up period for gas paid for but not taken; (2) extend the term of the subject contract to April 1, 1984; (3) delete the favored-nation provision from the contract, and (4) change the pricing provisions in the contract to provide for a 1.0¢ periodic increase on April 1, 1969, for a five year period and a similar increase for each of the two succeeding five year periods thereafter.

On January 14, 1965, Transco reported, in Docket No. RP65–31, that it will flow-through the monies it will receive from Socony in accordance with Transco's settlement agreement in Docket No. RP61–13, which was approved by Commission order February 2, 1962, 27 FPC 187. Studies reveal that Transco's jurisdic-

tional pipeline customers, with the exception of Manufacturers Light and Heat Company (Manufacturers) are presently obligated to flow-through to their customers all substantial jurisdictional amounts of refunds they might receive. Consequently, Transco shall retain that portion of the refunds it receives from Socony due and owing to Manufacturers pending further order of the Commission.

In accepting this settlement proposal we desire to make it clear that our action herein should not be construed as constituting approval of any future rate increases that may be filed under the subject rate schedule and is without prejudice to any findings or orders of the Commission in any future proceedings, including area rate or other similar proceedings, involving Socony's rate and rate schedule.

The Commission finds:

The proposed settlement of the above-captioned proceedings on the basis described herein, as more fully set forth in the settlement proposal filed with the Commission by Socony on May 27, 1965, is in the public interest and appropriate to carry out the provisions of the Natural Gas Act and should be approved and made effective as hereinafter ordered.

The Commission orders:

(A) The settlement of the proceedings in Docket Nos. G–12201 and G–17526 on the basis of the settlement proposal, filed by Socony on May 27, 1965, is hereby approved.

(B) Socony shall compute the difference between the rate collected subject to refund and the related settlement rate for the period from March 29, 1961 to April 2, 1964, together with interest as specified in Docket No. G–17526 to April 30, 1965. Socony shall within 45 days from the date of this order submit a report to the Commission, and serve a copy on Transco, setting out the amount of refunds related to its rate schedule (showing separately the principal and applicable interest), the basis used for such determination and the period covered.

(C) Within 90 days from the date of issuance of this order, Socony shall refund to Transco the refund monies it has computed, pursuant to paragraph (B) above for gas sold and delivered to Transco with applicable interest, and shall 10 days thereafter file a release from Transco for such monies.

(D) Transco shall make refunds to its jurisdictional customers in accordance with the settlement agreement which was approved in Docket No. RP61–13 on February 2, 1962; *provided, however:* Transco shall retain, until further order of the Commission, those sums due and owing to Manufacturers; Transco shall within 10 days thereafter file with the Commission a report setting out the amount of refunds it made (showing separately the principal and interest) and 30 days thereafter it shall file releases from its jurisdictional customers showing receipt of the refunds.

(E) If Manufacturers will voluntarily assume the obligation to flow-through the amount computed pursuant to paragraph (D) or is presently obligated to flow-through such amounts by prior order of the Commission, a report setting forth the details of such obligation or an agreement assuming obligation to flow-through the refund shall be filed by Manufacturers within 10 days from the issuance of this order.

(F) Where any pipeline subject to the jurisdiction of this Commission receives a refund pursuant to this order and contrary to our conclusion that the jurisdictional portion thereof will flow-through to its customers, claims the right to retain such amounts, that pipeline shall report to the Commission within 10 days of the date of this order the basis of such claim, and when the

amount is received, that pipeline shall retain the amount in dispute subject to our further order.

(G) The amounts ordered to be retained pursuant to Paragraph (D) shall be retained by Transco under one of the following methods. The choice of method is optional to Transco.

1. Commingled with its general assets but interest at 6 percent per annum shall be paid from the date the funds would flow-through, if not so retained, to the date on which they are paid to the person ultimately determined to be entitled thereto in a final order of the Commission,

2. Deposited in a special escrow account within 185 days of the date of issuance of this order, if not so retained. If the fund is deposited in such an escrow account, the following conditions must be met:

(a) Transco shall submit 65 days from the date of receipt of the refund from Socony, an executed escrow agreement conditioned as set out below with a certificate showing service on the party to whom the fund would otherwise be payable. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between Transco and any bank or trust company used as a depository for funds of the United States Government and the agreement shall be conditioned as follows:

(b) Transco, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such person or persons as may be identified and designated by final order of the Commission and in such manner as may be therein specified, all or any portion of such deposits and the interest thereon.

(c) The bank or trust company may invest and reinvest such deposits in any short-term indebtedness of the United States or any agency thereof or in any form of obligation guaranteed by the United States which is, respectively, payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(d) Such bank or trust company shall be liable only for such interest as the invested funds described in subparagraph (c) above will earn and no other interest may be collected from it.

(e) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(f) Such bank or trust company shall report to the Secretary quarterly, certifying the amount deposited in the trust account for the quarterly period.

(H) Within 90 days from the date of issuance of this order, Socony shall make such rate schedule filings under its FPC Gas Rate Schedule No. 16 as are required to make effective the settlement proposal as approved herein.

(I) Upon full compliance by Socony with the terms and conditions of this order Docket Nos. G–12201 and G–17526 are severed from the consolidated proceedings in Docket No. AR61–2, *et al.*, and said proceedings are to be deemed terminated without further order of the Commission.

(J) This order is without prejudice to any findings or orders which have been or may be made hereafter by the Commission, and is without prejudice

to claims or contentions which may be made by Socony, the Commission staff, or any affected party hereto, in any proceedings now pending, including area rate or similar proceedings, or hereafter instituted by or against Socony or any other companies, persons or parties affected by this order.

OPINION NO. 466

VILLAGE OF GRESHAM, WISCONSIN, PROJECT NO. 2464

OPINION AND ORDER ADOPTING INITIAL DECISION OF PRESIDING EXAMINER

(Issued July 13, 1965)*

Syllabus

1. Proposed Weed Dam project, as conditioned, found best adapted to comprehensive plan for development of river as required by Section 10(a) of Federal Power Act. PP. 35, 36.
2. All other factors being equal, Commission will continue to accord an applicant the right to finance and build if proper showing of market feasibility can be made. P. 36.
3. Interests of regulatory process are best served by a flexible posture with respect to specific applications and individual problems presented. P. 36.
4. Assuming operation of the Village projects to obtain maximum benefits, project, while marginal, is economically feasible and net benefits will exceed costs. P. 49.
5. *Distinguishing Namekagon*, Commission *notes* that in instant proposal recreational values themselves outweigh any potential damage to fish and any adverse impact upon aesthetic values involved in inundation of small falls. PP. 36, 50.
6. Better stream regulation is possible with coordinated operation of the two projects and probability is that Red River flow will actually be improved. P. 37.
7. In view of extensive trout stocking in the vicinity, loss of limited spawning area will not inflict any substantial damage to fishing. P. 37.
8. Evidence showing logs were driven down Red River past proposed site, becoming large mass of logs processed into lumber products which in turn moved into streams of interstate commerce, is sufficient to establish navigability within scope of Section 3(8) of Federal Power Act. P. 50.
9. Red River has been used and is suitable for use for transportation of persons or property in interstate or foreign commerce and consequently is "navigable" within meaning of Section 23(b) of the Act. P. 51.
10. Commission *issues* 50-year license to applicant under Sections 4(e) and 10(i) of the Act.

Chairman Swidler and Commissioner Ross *dissenting*.

E. L. Aschenbrener and *Adolph P. Lehner* for Village of Gresham, Wisconsin.

Orville S. Luchenbach for Jack Brown, Charles Brown, Harry Schmidt, and Ed Branson.

James F. Bakken for State Conservation Commission of Wisconsin.

Donald A. Sander for Staff of the Federal Power Commission.

---

*Initial decision appears on p. 46. Rehearing denied by order issued August 18, 1965, 34 FPC 534. Pet. for review dismissed November 19, 1965 [CA7 No. 15383].

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

O'CONNOR, *Commissioner:*

This proceeding involves an application filed by the Village of Gresham, Wisconsin, a municipal corporation under Wisconsin law (Applicant or Gresham) for a license to construct a hydro-electric project to be known as the Weed Dam, on the Red River, a tributary of the Wolf River, in Shawano County, Wisconsin. Applicant presently operates an existing hydro-electric project known as the Gresham Dam, located in the Village of Gresham, approximately one and one-half miles upstream from the proposed Weed Dam. The application for license was opposed by the Isaac Walton League, the State Conservation Commission of Wisconsin, and several local property owners.[1]

Pursuant to our order of July 20, 1964, a hearing was held in Shawano, Wisconsin, on August 18, 19 and 20, 1964. Presiding Examiner William C. Levy, in his decision issued on December 7, 1964, recommended granting a 50-year license to the applicant subject to certain conditions. The proceeding is before us upon exceptions to the Examiner's decision filed by Harry Schmidt, Charles Brown, Jack Brown and Ed Branson (Intervenors). Other than these few landowners, no party has filed exceptions to the Examiner's decision. A brief opposing exceptions and urging adoption of the Examiner's decision was filed by the Commission Staff.[2]

The Weed Dam Project, a run of the river plant, would consist of a concrete center section approximately 105 feet long with a 64-foot spillway section, flanked on either side by two earth dikes, each approximately 700 feet long. The reservoir created by the dam would have a surface area of approximately 235 acres and would provide a gross head of 25 feet for power generation. The reservoir would extend upstream approximately one and one-half miles to the existing Gresham hydro-electric and diesel plant which is presently operated by the Applicant. Two units having a total of 800 horsepower will be installed; one having a capability of 120 kilowatts, and the other 350 kilowatts. The design and location of the powerhouse and spillway is such that water passing through the powerhouse by-passes approximately 700 feet of the original stream bed below the spillway section.

Applicant estimates its cost between $250,000.00 and $260,000.00. Staff derived a figure of $269,000.00 by using Applicant's cost figures and adding the cost of engineering. By giving a first lien on its existing project, Applicant has obtained a bond issue in the amount of $250,000.00 at an interest rate varying from three to four and one-quarter percent. The bonds are for a term of 20 years. The first payment of interest is due in 1965, and the first payment of principal and interest will be due in 1966. Applicant has already expended approximately $74,880.00 for equipment, land, flowage rights, clearance of land, and engineering expenses.

The Gresham electrical system includes service to the Village itself and approximately 87 miles of lines serving the town of Red Springs and parts of the towns of Herman, Seneca and Richmond. The existing powerhouse, built in 1929, has an installed capacity of 275 kilowatts comprised of two units; one rated 100 kilowatts and the other at 175 kilowatts. The present reservoir covers 240 acres with a gross head of 38 feet. In view of the anticipated growth of the Village and the cost of purchasing power from Wisconsin Power & Light Company or diesel

[1] Intervention was granted these petitioners by the Commission's orders of July 20, 1964 and August 14, 1964.

[2] Exceptions to the Examiner's decision on behalf of the Intervenors were mailed by counsel on the date they should have been filed in the Commission offices, and were consequently received several days late. However, under the delegation of authority contained in Section 3.5 of the Commission's Rules of Practice and Procedure the exceptions were properly accepted by the Secretary for filing.

generation, Gresham seeks to obtain additional hydro-generation to supply its needs at a lower cost than its other two sources of power can presently provide.

Generation of the Gresham hydro-plant in 1961, 1962 and 1963 was 2,158,100 kilowatt hours, 2,178,900 kilowatt hours, 1,858,000 kilowatt hours, respectively, at an estimated cost per kilowatt hour of 6.0 mills. In 1963 its diesel installation, having an aggregate capacity of 657 kilowatts generated 309,620 kilowatt hours at a cost of approximately 2 cents per kilowatt hour and Gresham purchased 2,093,280 kilowatt hours from Wisconsin Power & Light Company at a cost of approximately 1.61 cents per kilowatt hour. During 1963, the demand furnished by the Wisconsin Power & Light Company was 672 kilowatts. A new 69-kv line is presently being constructed by Wisconsin Power & Light to serve the Village and there is a provision for the sale of dump power from Gresham's hydro-installation at 4 mills per kilowatt hour.

Staff estimated the average annual flow in the Red River at the proposed site to be 150 cfs, and computed a figure of 2,230,000 kilowatt hours as the average annual energy output. The annual cost of operating the project would be $23,600. Based on these figures the annual cost of power would be 1.058 cents per kilowatt hour. From computations of Gresham's predicted load for 1970, Staff estimated that the annual cost of purchasing power from Wisconsin Power & Light in lieu of the Weed Project would be 1.44 cents per kilowatt hour. Even if the national average reduction predicted by the National Power Survey Report were realized, the annual costs of power would, at best, equal the cost of power from the project. In any event, based on the cost of producing power at the project, plus the cost of additional purchases to the year 1970, the total cost per kilowatt hour would be 1.315 cents, or an immediate 8.7 percent decrease in total power costs to the Village to be realized over the entire period. Gresham also proposes to install a third small 10 kilowatt unit for the purpose of generating power from water to be released to the bypassed section of the river, thus a slightly higher average annual energy output would be derived, particularly at low flows. Gresham intends to operate the proposed project by remote control from its existing powerhouse and to coordinate the operation of both projects so as to absorb peak loads and reduce the demand charges for purchased power. Such operation could provide more uniform flows below the Weed Dam. Combined available capacity of the existing Gresham plant and the proposed Weed Project is estimated at a monthly range of 513 to 770 kilowatts; 300 kilowatts from the existing plant and 470 kilowatts from the proposed Weed Project.

The Examiner, noting that the proposed project had been approved by the Wisconsin Public Service Commission as well as the Village of Gresham, concluded that adequate financing had been arranged. Further, he determined that the project expands the existing Gresham system and that its economic feasibility depends upon coordinated use of the two plants for peaking operations. The Examiner, assuming operating of the Gresham projects to obtain maximum benefits, found that the project, while marginal, is economically feasible and that net benefits will exceed costs. The benefit/cost ratio, based on Staff estimates, is 1.17 which compares favorably with many other licensed projects. While trout fishing in a limited area may be adversely affected, he found overall fishing and recreational facilities would probably be improved by the proposed project. Accordingly, the Examiner recommended issuance of a license subject to certain conditions designed to assure comprehensive development pursuant to Section 10(a) of the Federal Power Act.

Upon review of the record presented at the hearing, the parties' briefs, the Examiner's decision, and the exceptions thereto, it is our judgment that a license should be issued to the Applicant upon the conditions recommended by the Examiner. Subject to these conditions, we find the Applicant's proposed Weed Dam project to be best adapted to a comprehensive plan for the development of

the river as required by Section 10(a) of the Act.[3] We adopt the Examiner's decision.

The dissenting opinion, while agreeing that the present project will be of immediate benefit to Gresham, apparently would deny it on the grounds that Gresham's power supplier, Wisconsin Power & Light, whose present rates are admittedly higher than those of Gresham, could over a period of time put in a more efficient generating plant than that contemplated by Gresham and that, extrapolating costs to about 1980 the contemplated dam at that period might be a relatively high cost component in the Village's overall power supply. However, we are not passing upon whether a project of this size and degree of efficiency would make economic sense for Wisconsin Power in the light of its much greater service responsibilities and financial resources. The applicant is Gresham. It is proposing an expansion of its system which would admittedly be of immediate benefit to it and of continuing benefit for at least the next fifteen or twenty years. Certainly the National Power Survey does not suggest that a small distributor, owning a generating plant which makes a significant contribution to its total power supply, should nevertheless be required to refrain from improving its own generating capacity in the hope that the major supplier will take the necessary steps which in the distant future might make the immediate gains less significant. For Gresham's purposes the power from Weed Project is not "relatively high cost." Furthermore, all other factors being equal, we shall continue to accord an applicant the right to finance and build if it can make a proper showing of market feasibility. Clearly, the interests of the regulatory process are best served by a flexible posture with respect to specific applications and the individual problems each may present.

The Intervenors in their exceptions essentially argue that the facts in the instant proceeding are parallel to the facts in *Namekagon Hydro Company* v. *Federal Power Commission*, 216 F. 2d 509 (CA7–1954) and that the Examiner's decision is contrary to the findings in the *Namekagon* case.

The Intervenors' basic argument is not persuasive. In *Namekagon*, construction of the Namekagon project with a reservoir some six miles in length would have caused considerable loss within the project area of compelling features having unique recreational values, particularly scenery and canoeing activity. The *Namekagon* case held that, where such unique and special types of recreation are present, even though of only local or regional interest, the Commission will preserve those recreational values in the public interest at the cost of loss of power pursuant to Section 10(a) of the Federal Power Act. Consequently, a license was denied. Here the one and one-half mile reservoir to be formed by the Weed Dam would inundate approximately 230 acres of land, most of which are low and marshy and where fishing is meager. A small falls just above the project site would be inundated. Until recently, when it was purchased by the Applicant, this land was privately owned. In our opinion the recreational values afforded by the proposal themselves outweigh any potential damage to fish and any adverse impact upon the aesthetic values involved in the inundation of such small falls. The record in this proceeding indicates that the project will provide an ideal site for a reservoir which will furnish sites for an estimated 300 privately owned shoreline cottages. More importantly, however, we are impressed with the fact that the city itself has already acquired sites at the reser-

[3] Section 10(a) of the Federal Power Act provides in pertinent part that all licenses issued shall be subject to the following conditions: That the project adopted * * * shall be such that in the judgment of the Commission will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial uses, including recreational purposes; * * *

voir for such public recreational facilities as boating, swimming, wading, parking area, and camping sites. These are concrete public values which must be given recognition in evaluating this proposal. On the whole public recreational facilities will be improved and enlarged by the project.

Intervenors contend that the Examiner's decision does not take the objections of downstream property owners into consideration. These objections are primarily based on fluctuations in flow and increase in water temperature attributed to the existing hydro-electric development. The record reveals that witnesses offered no basis for their assumptions that fluctuations in flow and increases in water temperature would be amplified with the building of another hydro-electric project. We agree with the Examiner that, in fact, better stream regulation is possible with the coordinated operation of the two projects, and the probability is that the stream flow will actually be improved.

The Intervenors argue that trout sprawning grounds would be ruined by the proposed project. This argument must be rejected. The only evidence of trout spawning in the project area is in the short stretch of the stream from the dam site to the small falls, a distance of approximately 300 to 400 yards. Most trout fishing in Mill Creek takes place in the rapids area above the proposed project reservoir. This is one of the areas stocked by the State Conservation Commission of Wisconsin. In 1964, the following legal size trout were planted; 3,000 Brook, 3,000 Brown and 3,000 Rainbow. In view of the extensive trout stocking operations in this vicinity we conclude that loss of this limited spawning area will not inflict any substantial damage to fishing activities in this area.

The Intervenors maintain that deleterious effects will take place as a result of the effluent which is discharged from the Gresham sewage system. The Examiner had adequately answered this contention. In Article 31 of the license, the Examiner would require the licensee to take corrective measures any time the discharge from the sewage system has a harmful effect on the use of the reservoir for recreational purposes and the license issued herein will so provide.

After examining all uses of the resources involved and recognizing the various benefits to the region to be derived from the project, we conclude that it will be consistent with the public interest to grant a 50-year license to the Applicant. Gresham has shown that it can finance its proposed project. The power to be generated is to be used on system loads. Economic feasibility depends upon coordinating use of the existing Gresham plant and the proposed Weed Project for peaking operations. The method of operation proposed by the Applicant can be achieved while, concurrently, sound planning can improve stream flow conditions below the dam site over those presently existing with the operation of a single dam and reservoir. Development of the water resource involved will provide public benefits, including benefits for recreation, consistent with the requirements for its comprehensive development under Section 10(a) of the Federal Power Act.

The Commission finds:

(1) The Red River in Wisconsin is navigable from its confluence with the Wolf River upstream through the project site to a point beyond the Village of Gresham, Wisconsin.

(2) The Red River has historically been used to transport logs, some of which passed into interstate commerce, and is still used for canoeing.

(3) The Red River is suitable and capable of continuous and uninterrupted use for transportation of products in interstate commerce through the Wolf River, through Lake Poygan, Lake Winnoconne, Lake Winnebago, and then to points in other states through the Fox River into Lake Michigan, and is a navigable waterway of the United States within the meaning of Section 3(8) of the Federal Power Act.

(4) Under the provisions of Section 23(b) of the Federal Power Act the Applicant, the Village of Gresham may not construct, operate or maintain a project at the proposed site until a license shall be obtained therefor pursuant to this Act.

(5) Public notice of these proceedings has been given as required by the Act.

(6) The Applicant is a Municipality organized under the laws of the State of Wisconsin, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the proposed project.

(7) The proposed project does not affect a Government dam, nor will the issuance of a license therefor affect the development of any water resources for public purposes which should be undertaken by the United States.

(8) The proposed Project No. 2464, also known as the Weed Dam would be located just West of a point where a town road crosses the Red River about a mile and a half East of the Village of Gresham.

(9) The proposed project would consist of a dam consisting of a concrete center section flanked by two earth dikes, and would form a reservoir of approximately 230 acres with a gross power head of about 25 feet developing a total capacity of 470 kilowatts from two turbines having a total rating of 800 horsepower.

(10) The project structures proposed by the Applicant would be safe and stable if constructed pursuant to usual engineering methods and practices.

(11) Subject to the terms and conditions set forth below, the plans of the Applicant to develop the Weed site are best adapted to conserve and utilize in the public interest the water resources involved for the use or benefit of interstate commerce, for the improvement and utilization of water-power development, and for other beneficial public uses, including recreational purposes under Section 10(a) of the Federal Power Act.

(12) The amount of annual charges to be paid under the license for the purpose of reimbursing the United States for the costs of administration of Part I of the Act is reasonable as hereinafter fixed and specified.

(13) The Applicant shall make provision for release of fresh water into the section of the Red River by-passed by the tailrace for the benefit of fish life.

(14) The Applicant shall take any measures necessary to prevent the discharge of its sewage treatment plant from having a harmful effect on the use of the reservoir for recreational purposes.

(15) The Applicant shall devise a method of operation to prevent fluctuations in flow below the Weed Dam from endangering life and property.

(16) It will be in the public interest to waive pursuant to Section 10(i) of the Act the terms and conditions contained in the following sections of Part I of the Act:

> Section 4(b), except the second sentence thereof; 4(e) insofar as it relates to approval of plans by the Chief of Engineers and the Secretary of the Army and to public notice; 6, insofar as it relates to public notice and to the acceptance and expression in the license of terms and conditions of the Act which are hereinafter waived; 10(c), insofar as it relates to depreciation reserves; 10(d); 10(f); 14, except insofar as the power of condemnation is reserved; 15; 19; 20; 22; and 23(a), insofar as it relates to the determination of fair value.

(17) The exhibits designated and described in paragraph (B) below, which were included as part of Exhibit 2 of the hearing record, substantially conform to the Commission's rules and regulations and should be approved as part of the license for the project.

The Commission orders:

(A) This license is hereby issued to the Village of Gresham, Wisconsin under Sections 4(e) and 10(i) of the Act, for a period of 50 years effective as of the first day of the month in which the Commission acts on the application for license for the continued operation and maintenance of Project No. 2464, located on the Red River, a navigable water of the United States, subject to the terms and conditions of the Act insofar as not expressly waived herein, which Act is incorporated herein by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Project No. 2464 consists of:

(i) all lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined.

(ii) a combination concrete gravity and earth dam about 1,505 feet long; two penstocks extending from the intake at the dam to a powerhouse containing two units, one rated 120 kw and one rated 350 kw, operating under a normal head of about 25 feet; and all other structures, fixtures, equipment or facilities used or useful in the operation and maintenance of the project and located on the project area; and all rights and interests therein, the possession of which is necessary in the maintenance and operation of the project. The location, nature, and character of the project structures are more specifically shown and described by the exhibits which formed part of Exhibit 2 of the hearing record and which are designated and described as follows:

Exhibit	FPC No. 2464	Applicant's dwg. No.	Showing
L-1	3	W106-C4.1	Project Layout.
L-2	4	W106-C5.1	General Plan.
L-3	5	W106-C6.1	Spillway & Walls.

(C) The Licensee is also subject to the terms and conditions of the following articles, which terms and conditions, designated as Articles 1 through 31 are made a part hereof:

Article 1. The entire project, as described in the order of the Commission, shall be subject to all the provisions, terms, and conditions of the license.

Article 2. No substantial change shall be made in the maps, plans, specifications, and statements described and designated as exhibits and approved by the Commission in its order as a part of the license until such change shall have been approved by the Commission: Provided, however, that if the Licensee or the Commission deems it necessary or desirable that said approved exhibits, or any of them, be changed, there shall be submitted to the Commission for approval amended, supplemental, or additional exhibit or exhibits covering the proposed changes which, upon approval by the Commission, shall become a part of the license and shall supersede, in whole or in part, such exhibit or exhibits theretofore made a part of the license as may be specified by the Commission.

Article 3. Said project works shall be constructed in substantial conformity with the approved exhibits referred to in Article 2 herein or as changed in accordance with the provisions of said article. Except when emergency shall require for the protection of navigation, life, health, or property, no substantial alteration or addition not in conformity with the approved plans shall be made to any dam or other project works under the license without the prior approval of the Commission; and any emergency alteration or addition so made so all thereafter be

subject to such modification and change as the Commission may direct. Minor changes in the project works or divergence from such approved exhibits may be made if such changes will not result in decrease in efficiency, in material increase in cost, or in impairment of the general scheme of development; but any of such minor changes made without the prior approval of the Commission, which in its judgment have produced or will produce any of such results, shall be subject to such alteration as the Commission may direct. The Licensee shall comply with such rules and regulations of general or special applicability as the Commission may from time to time prescribe for the protection of life, health, or property.

Article 4. The construction, operation, and maintenance of the project and any work incident to additions or alterations, whether or not conducted upon lands of the United States, shall be subject to the inspection and supervision of the Regional Engineer, Federal Power Commission, in the region wherein the project is located, or of such other officer or agent as the Commission may designate, who shall be the authorized representative of the Commission for such purposes. The Licensee shall furnish to said representative such information as he may require concerning the construction, operation, and maintenance of the project, and of any alteration thereof, and shall notify him of the date upon which work will begin, and as far in advance thereof as said representative may reasonably specify, and shall notify him promptly in writing of any suspension of work for a period of more than one week, and of its resumption and completion. The Licensee shall allow him and other officers or employees of the United States, showing proper credentials free and unrestricted access to, through, and across the project lands and project works in the performance of their official duties.

Article 5. So far as is consistent with proper operation of the project, the Licensee shall allow the public free access, to a reasonable extent, to project waters and adjacent project lands owned by the Licensee for the purpose of full public utilization of such lands and waters for navigation and recreational purposes, including fishing and hunting, and shall allow to a reasonable extent for such purposes the construction of access roads, wharves, landings, and other facilities on its lands the occupancy of which may in appropriate circumstances be subject to payment of rent to the Licensee in a reasonable amount: Provided that the Licensee may reserve from public access, such portions of the project waters, adjacent lands, and project facilities as may be necessary for the protection of life, health, and property and provided further, that the Licensee's consent to the construction of access roads, wharves, landings, and other facilities shall not, without its express agreement, place upon the Licensee any obligation to construct or maintain such facilities. These facilities are in addition to the facilities that the Licensee may construct and maintain as required by the license.

Article 6. Insofar as any material is dredged or excavated in the prosecution of any work authorized under the license, or in the maintenance of the project, such material shall be removed and deposited so it will not interfere with navigation, and will be to the satisfaction of the District Engineer, Department of the Army, in charge of the locality.

Article 7. The United States specifically retains and safeguards the right to use water in such amount, to be determined by the Secretary of the Army, as may be necessary for the purpose of navigation on the navigable waterway affected; and the operations of the Licensee, so far as they affect the use, storage and discharge from storage of waters affected by the license, shall at all times be controlled by such reasonable rules and regulations as the Secretary of the Army may prescribe in the interest of navigation, and as the Commission may prescribe for the protection of life, health, and property, and in the interest of the fullest

practicable conservation and utilization of such waters for power purposes and for other beneficial public uses, including recreational purposes; and the Licensee shall release water from the project reservoir at such rate in cubic feet per second, or such volume in acre-feet per specified period of time, as the Secretary of the Army may prescribe in the interest of navigation, or as the Commission may prescribe for the other purposes hereinbefore mentioned.

Article 8. Whenever the United States shall desire, in connection with the project, to construct fish and wildlife facilities or to improve the existing fish and wildlife facilities at its own expense, the Licensee shall permit the United States or its designated agency to use, free of cost, such of Licensee's lands and interest in lands, reservoirs, waterways and project works as may be reasonably required to complete such facilities or such improvements thereof. In addition, after notice and opportunity for hearing the Licensee shall modify the project operation as may be prescribed by the Commission, reasonably consistent with the primary purpose of the project, in order to permit the maintenance and operation of the fish and wildlife facilities constructed or improved by the United States under the provision of this article. This article shall not be interpreted to place any obligation on the United States to construct or improve fish and wildlife facilities or to relieve the Licensee of any obligation under this license.

Article 9. If the Licensee shall cause or suffer essential project property to be removed or destroyed or to become unfit for use, without replacement, or shall abandon or discontinue good faith operation of the project for a period of three years, or refuse or neglect to comply with the terms of the license and the lawful orders of the Commission mailed to the record address to the Licensee or its agent, the Commission will deem it to be the intent of the Licensee to surrender the license, and not less than 90 days after public notice may in its discretion terminate the license.

Article 10. Upon abandonment of the project the Licensee shall remove all buildings, equipment and power lines to a condition satisfactory to the Commission's authorized representative and shall fulfill such other obligations under the license as the Commission may prescribe.

Article 11. Whenever the United States shall desire to construct, complete, or improve navigation facilities in connection with the project, the Licensee shall convey to the United States, free of cost, such of its lands and its rights-of-way and such right of passage through its dams or other structures, and permit such control of pools as may be required to complete and maintain such navigation facilities.

Article 12. The Licensee shall furnish free of cost to the United States power for the operation and maintenance of navigation facilities at the voltage and frequency required by such facilities and at a point adjacent thereto whether said facilities are constructed by the Licensee or by the United States.

Article 13. The operation of any navigation facilities which may be constructed as a part of or in connection with any dam or diversion structure constituting a part of the project works shall at all times be controlled by such reasonable rules and regulations in the interest of navigation, including the control of the level of the pool caused by such dam or diversion structure, as may be made from time to time by the Secretary of the Army.

Article 14. The Licensee shall for the protection of navigation, construct, maintain and operate at its own expense such rights and other signals on fixed structures in or over navigable waters of the United States as may be directed by the Secretary of the Department in which the Coast Guard is operating.

Article 15. The Licensee shall, after notice and opportunity for hearing, coordinate the operation of the project, electrically and hydraulically, with such

other power systems and in such manner as the Commission may direct in the interest of power and other beneficial public uses of water resources, and on such conditions concerning the equitable sharing of benefits by the Licensee as the Commission may order.

Article 16. The Licensee shall, for the conservation, and development of fish and wildlife resources, construct, maintain, and operate, or arrange for the construction, maintenance and operation of such facilities and comply with such reasonable modifications of the project structures and operation as may be ordered by the Commission upon its own motion or upon the recommendation of the Secretary of the Interior or the fish and wildlife agency or agencies of any State in which the project or a part thereof is located, after notice and opportunity for hearing and upon findings based on substantial evidence that such facilities and modifications are necessary and desirable, reasonably consistent with the primary purpose of the project, and consistent with the provisions of the Act.

Article 17. The Licensee shall construct, maintain and operate or shall arrange for the construction, maintenance and operation of such recreational facilities including modifications thereto, such as access roads, wharves, launching ramps, beaches, picnic and camping areas, sanitary facilities and utilities, as may be prescribed hereafter by the Commission during the term of this license upon its own motion or upon the recommendation of the Secretary of the Interior or other interested Federal and State agencies, after notice and opportunity for hearing and upon findings based upon substantial evidence that such facilities are necessary and desirable, and reasonably consistent with the primary purpose of the project.

Article 18. The Licensee shall be responsible for and shall minimize soil erosion and siltation on lands adjacent to the stream resulting from the construction and operation of the project. The Commission upon request, or upon its own motion, may order the Licensee to construct and maintain such preventive works to accomplish this purpose and to revegetate exposed soil surface as the Commission may find to be necessary after notice and opportunity for hearing.

Article 19. No lease of the project or any part thereof whereby the lessee is granted the occupancy, possession, or use of the project, or any part thereof, shall be made without prior written approval of the Commission; and the Commission may, if in its judgment the situation warrants, require that all the conditions of the license, of the Act, and of the rules and regulations of the Commission shall be applicable to such property so leased to the same extent as if the lessee were the Licensee: Provided, that the provisions of this article shall not apply to leases of land or buildings or other property while not required to achieve the purposes of the license.

Article 20. Upon the completion of the project, or at such other time as the Commission may direct, the Licensee shall submit to the Commission for approval revised maps, plans, specifications, and statements insofar as necessary to show any divergence from or variation in the project area and project boundary as finally located or in the project works as actually constructed when compared with the area and boundary shown and the works described in the license or in the maps, plans, specifications, and statements approved by the Commission, together with a statement in writing setting forth the reasons which in the opinion of the Licensee necessitated or justified variations in or divergence from the approved maps, plans, specifications, and statements. Such revised maps, plans, specifications, and statement shall, and if and when approved by the Commission, be made a part of the license under the provisions of Article 2 hereof.

Article 21. The Licensee shall furnish to the Commission within 60 days from the effective date of this license, tracings of the Exhibit L drawings listed herein under paragraph (B) (ii).

Article 22. In the construction and maintenance of the project works, the Licensee shall place and maintain suitable structures and devices to reduce to a reasonable degree the liability of contact between its transmission lines, and telegraph, telephone, and other signal wires or power transmission lines constructed prior to its transmission lines and not owned by the Licensee, and shall also place and maintain suitable structures and devices to reduce to a reasonable degree the liability of any structures or wires falling and obstructing traffic and endangering life on highways, streets, or railroads. None of the provisions of this article is intended to relieve the Licensee from any responsibility or requirement which may be imposed by other lawful authority for avoiding or eliminating inductive interference.

Article 23. The Licensee shall do everything reasonably within its power and shall require its employees, contractors, and employees of contractors to do everything reasonably within their power, both independently and upon request of officers of the agency of the United States concerned, to prevent, make advanced preparations for suppression, and suppress fires on lands occupied under the license.

Article 24. For the purpose of determining the stage and flow of the stream or streams from which water is diverted for the operation of the project works, the amount of water held in and withdrawn from storage, and the effective head on the turbines, the Licensee shall install and thereafter maintain such gages and stream-gaging stations as the Commission may deem necessary and best adapted to the requirements; and shall provide for the required readings of such gages and for adequate rating of such stations. The Licensee shall also install and maintain standard meters adequate for the determination of the amount of electric energy generated by said project works. The number, character, and location of gages, meters, or other measuring devices, and the method of operation thereof, shall at all times be satisfactory to the Commission and may be altered from time to time if necessary to secure adequate determinations, but such alteration shall not be made except with the approval of the Commission or upon the specific direction of the Commission. The installation of gages, the ratings of said stream or streams, and the determinations of the flow thereof, shall be under the supervision of, or in cooperation with, the District Engineer of the United States Geological Survey having charge of stream-gaging operations in the region of said project, and the Licensee shall advance to the United States Geological Survey the amount of funds estimated to be necessary for such supervision or cooperation for such periods as may be mutually agreed upon. The Licensee shall keep accurate and sufficient record of the foregoing determinations to the satisfaction of the Commission, and shall make return of such records annually at such time and in such form as the Commission may prescribe.

Article 25. The right of the Licensee and of its transferees and successors to use or occupy navigable waters of the United States under the license for the purpose of maintaining the project works or otherwise, shall absolutely cease at the end of the license period, unless a new license is issued pursuant to the then existing laws and regulations.

Article 26. The terms and conditions expressly set forth in the license shall not be construed as impairing any terms and conditions of the Federal Power Act which are not expressly waived in the license.

Article 27. The Licensee shall pay to the United States the following annual charge:

(i) For the purpose of reimbursing the United States for the costs of Administration of Part I of the Act $31.30.

Article 28. Licensee shall make provision to supply initially, a continuous flow of not less than 7 cu. feet per second for the benefit in the bypassed 700-foot stretch of river located between the Weed Dam and the end of the tailrace and shall submit the plans to the Commission before construction of the project commences. Licensee shall, after construction of the project, undertake a study with the Wisconsin Conservation Department to determine whether greater flows are necessary to prevent fish kill in this stretch of river.

Article 29. Licensee shall submit a plan for the protection of life and property downstream of the project for those periods when operation of the powerhouse is expected to cause substantial streamflow fluctuations and shall submit such plan to the Commission for approval.

Article 30. The Licensee shall within one year from the date of issuance of the license, file with the Commission for approval its proposed recreational use plan for the project. The plan shall be prepared after consultation with appropriate Federal, State and Local agencies, and shall include recreational improvements which may be provided by others in addition to the improvements the Licensee plans to provide.

Article 31. Licensee shall take corrective measures at any time the discharge of effluent from its sewage treatment plant has a harmful effect on the use of the reservoir for recreational purposes.

(D) The exhibits designated and described in paragraph (B) above are hereby approved as part of the license.

(E) The terms and conditions of the Act, which it has found above to be in the public interest to waive, are hereby excluded from this license.

(F) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgment of the acceptance of this license, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of issuance of this order.

(G) All material exceptions, arguments and objections not discussed herein have been considered but are without substantial support in the record or a reasonable basis in law and are denied. The Presiding Examiner's initial decision issued December 7, 1964, will be adopted by the Commission as of the date of issuance of this order, to constitute with this order its decision in this proceeding.

Chairman Swidler and Commissioner Ross *dissenting.*

SWIDLER, *Chairman* and ROSS, *Commissioner, dissenting:*

We dissent because we do not believe this project will contribute to low-cost power supply for the people of the Village of Gresham and that no adequate justification has been demonstrated for impairing the recreational values which the site possesses in its natural state.

Applicant intends to operate the proposed Weed Project by remote control from the existing Gresham powerhouse and to coordinate the operation of both projects so as to absorb the Village's peak loads, reduce the demand charges for purchased power, and maintain more uniform flows below the Weed Dam. Assuming operation of the Village projects to obtain maximum benefits, the examiner concluded that the project, while marginal, is economically feasible and that net benefits will exceed costs.

Because the electric power industry is inherently capital intensive, small systems are at an economic disadvantage in the production of power. This does not mean that small systems should necessarily purchase all of their power requirements from larger entities, but it does require that they carefully scrutinize the long range economic effect of the addition of small increments, such as the 470 kw installation proposed here. Such small and inefficient projects are being abandoned throughout the country and, in fact, the record shows that Wisconsin Power & Light Company is abandoning similar projects in the same area. The record also indicates that the applicant intends to install used turbines which were abandoned elsewhere. Construction and operation of such a project with the resulting relatively high cost power is an anachronism.

The proposed Weed Dam is an incremental project which realizes substantial cost-saving benefits from the existing operation. Nevertheless, operation of the project will saddle the Village with relatively high-cost power for years to come. Even assuming the most favorable operation of the project and projecting the Village's load to 1970, project power will still cost about 1,058 cents per kwh to produce.

In order to test the economic feasibility of the proposed project the examiner compared the annual cost for the proposed project with the cost of purchasing the additional power to meet the Village's future loads from Wisconsin Power & Light, since this was the lowest cost alternative source of power. The examiner found that power purchased from the Company cost the Village 1.76 cents in 1962 and 1.61 cents per kwh in 1963. Projecting its load to 1970, it is estimated that purchased power will cost about 1.44 cents per kwh.

It is apparent that the economic feasibility of the proposed project is made possible by the present high cost of alternative sources of power. It is reasonable to expect that the cost of purchased power will drop in the future while the cost of project power will remain at about the same level or possibly increase. Our prediction in the National Power Survey of a reduction of 42 percent in the price of electricity in the North Central Region by 1980 would mean that purchased power would be available for about 0.84 cents. True, this is a prediction and not a promise, but the prediction is based on solid evidence of the trend toward lower cost power.

In issuing a license for a hydroelectric project, Section 10(a) of the Federal Power Act requires the Commission to consider, among other things, the effect of the facility upon the scenic and recreational values of the area. As we read the testimony this project will flood out a waterfall and will impair the use of the downstream area for canoeing and fishing. The record indicates that some trout spawning and fish life will be lost as a result of the inundation of the portion of the Red River and Mill Creek and the by-passing of a 700-foot section of the Red River. While the applicant proposes to divert 7 cfs of water to the by-passed section of the river, there was apparently no fish study made to determine the number of fish involved or whether 7 cfs of water would be sufficient to sustain fish life. Furthermore, while the Department of the Interior and the Wisconsin Conservation Commission expressed concern over the warming effect of the water in the proposed reservoir on downstream fish and game, no complete temperature studies were available and the examiner was unable to make a finding as to whether the net effect on fish life would be adverse or beneficial. While the examiner concluded that the project would enhance the recreational values of the area, we believe the record is inadequate to support this finding.

The project is strongly opposed by the Wisconsin Conservation Commission and by many residents of the area who regard the fishing and boating opportunities as among their principal pleasures in life. If it made a clear-cut contribution to the power economy of the area, perhaps the benefits would outweigh the impairment of these local recreational opportunities. In the circumstances of this case there is little to show by way of advantage to the public interest.

There is testimony in the record that the lake which would be formed by the project would provide attractive homesites and indeed it is inferable from the record that enhancement of real estate values at the expense of power consumers may be the real motivation for the project. We find the record in this matter too spare to draw any conclusions, even assuming that the provision of homesites and enhancement of land values are objectives which the Commission may consider in exercising its licensing jurisdiction.

INITIAL DECISION
OF THE PRESIDING EXAMINER UPON APPLICATION FOR A HYDROELECTRIC LICENSE UNDER THE FEDERAL POWER ACT

(Issued December 7, 1964)

LEVY, *Presiding Examiner:* This proceeding is before the Federal Power Commission by reason of an application filed on April 20, 1964, by the Village of Gresham, Wisconsin, a municipal corporation under Wisconsin law, seeking a license to construct a proposed hydroelectric project on the Red River, Shawano County, Wisconsin, to be known as the Weed Dam. The Village of Gresham presently operates an existing hydroelectric project known as the Gresham Dam, located in the Village of Gresham about two miles upstream from the proposed Weed Dam.

Following public notice, petitions to intervene were filed and granted by Commission orders dated July 20 and August 14, 1964, to Harry Schmidt, Charles Brown, and Jack Brown, adjacent property owners, the Isaac Walton League of Wisconsin, and the Wisconsin State Conservation Commission. Pursuant to the Commission's order of July 20, 1964, a hearing was held in Shawano, Wisconsin on August 18, 19, and 20, 1964, at which all witnesses were presented and cross-examined. On September 9, 1964, Staff moved to reopen the record and admit as Exhibit 36, a letter from the Department of Health, Education, and Welfare dated August 25, 1964. Briefs were filed by the applicant, interveners, State Conservation Commission of Wisconsin and Staff, the last on October 14, 1964.

Background of Proceeding

On December 8, 1960, the Village of Gresham, Shawano County, as an electric public utility under Wisconsin law, filed an application with the Public Service Commission of Wisconsin for a permit to construct and maintain the proposed Weed Dam and hydroelectric project at an estimated cost of $277,500, about two miles downstream from applicant's existing hydroelectric plant in the Village of Gresham.

After hearing, the Public Service Commission of Wisconsin issued a decision dated July 9, 1963, granting the permit requested under the provisions of Section 31.06(3) of the Wisconsin Statutes (Exh. 1).

The Proposed Weed Project (Project No. 2464)

The proposed Weed Dam and hydroelectric plant would be located on the Red River in Shawano County, Wisconsin, about a mile and a half east of the Village of Gresham at a point immediately west of where the town road crosses the river (Exh. 5). The proposed dam consists of a concrete center structure about 105 feet long, containing two intake gates for the powerhouse penstocks, a spillway section about 64 feet long with four tainter gates five feet high and fourteen feet wide located perpendicular to the southern end of the intake gates, flanked on both sides by earth dikes, each about 700 feet long, one extending in a northerly direction parallel to the town road, and the other extending in a southwesterly direction. (See general location map.) The reservoir created by the dam would have a surface area of about 235 acres, a normal water surface elevation of 68 feet, a gross head for power of about 25 feet, and would extend upstream to the

existing hydro and diesel plant now operated by the Village. Two short penstocks, one having a diameter of 6.5 and the other 4 feet, would lead from the intake to the powerhouse about 50 feet to the east across the road where two units having a total of 800 horsepower will be installed. One unit will have a capability of 120 kilowatts, and the other 350 kilowatts, or a total of 470 kilowatts. The tailrace will extend eastward for about 200 feet where it will intersect the river. The distance from the proposed dam site to the discharge point of the tailrace is about 700 feet, so that water passing through the powerhouse will enter the original stream bed about 700 feet below the spillway section. (See Exhs. 5 and 6.) The proposed spillway would pass a design flood of 6,200 cfs without endangering the project structures. Additional protection is provided by a fuse plug spillway having a capacity of 2,000 cfs which is located about 520 feet west of the main dam. (See Exh. 5.)

In the proceeding before the Public Service Commission of Wisconsin, the cost of the project was estimated at $277,500. Applicant now hopes to build the project for between $250,000 and $260,000 (Tr. 67, 85). Staff derived a figure of $269,000 as its estimated cost by using applicant's cost figures and adding the cost of engineering. The State Conservation Commission of Wisconsin argues that the cost of a secondary sewage treatment plant for the Village of Gresham ($25,000 to $50,000) and a Hoppes generator and turbine ($4,000) will increase the total cost of the project from approximately $260,000 to $300,000.

The Village has borrowed the sum of $250,000 at a rate of interest varying from 3 to 4¼ percent by giving a first lien on its existing Gresham project. The bonds have a term of 20 years with the first payment of principal and interest due in 1966. The Village has already expended about $74,880 for equipment, land, flowage rights, clearance of land, and engineering expenses.

Gresham Electrical System Resources and Requirements

The Gresham electrical system includes the Village of Gresham and about 87 miles of lines serving the Town of Red Springs and parts of the Towns of Herman, Seneca, and Richmond. The existing Gresham powerhouse was built by 1929, and has an installed capacity of 275 kilowatts, comprised of two units, one rated 100 kilowatts and the other 175 kilowatts. The Gresham reservoir covers about 240 acres with a gross head of 38 feet.

In 1963, the Gresham hydro plant generated 1,858,000 kilowatt hours[1] at a cost of approximately six mills per kilowatt hour per year. Its diesel installation generated 309,620 kilowatt hours at a cost of about two cents per kilowatt hour, and the Village purchased 2,093,280 kilowatt hours of energy from the Wisconsin Power & Light Company at a cost of about 1.61 cents per kilowatt hour. The demand furnished by the Wisconsin Power & Light Company was 672 kilowatts during 1963. A new 69 kilovolt line is currently being constructed by the company to serve the Village and there is provision for sale of dump power from the Village's hydro installation at four mills per kilowatt hour.

Intervener witness Frederick, an official of Wisconsin Power & Light, and Staff witness Ahlstedt, testified in respect of the continued growth of the Gresham electrical system in both energy requirements and peak demand.[2]

[1] The generation in 1961 and 1962 was 2,158,100 and 2,178,900 kilowatt hours, respectively.

[2] See Exhs. 7, 13, and 24.

	1970		1980	
	Peak demand in kw	Energy in kwh	Peak demand in kw	Energy in kwh
Witness Ahlstedt	1275	6,150,000	2020	9,400,000
Witness Frederick	1230	5,900,000		

Staff witness Corso estimated the average annual flow in the Red River at the site of the proposed Weed project to be 150 cfs. (Tr. 323), and derived a figure of 2,230,000 kilowatt hours as the average annual energy output. This included an allowance for the release of approximately 7.5 cfs of the stream flow to provide for a constant minimum flow in the 700 foot stretch of the river to be by-passed by the project. Applicant's witness Calvert estimated the average annual energy output of the proposed project to be 2,200,000 kilowatt hours (Tr. 27). Applicant now proposes to install a third small ten kilowatt unit for the purpose of generating power from the water to be released to the by-passed section of the river. This will add to the average annual energy output, particularly at low flow. (See Applicant's br., p. 7.) Applicant intends to operate the proposed Weed project by remote control from the existing Gresham powerhouse and to coordinate the operation of both projects so as to absorb the Village's peak loads, reduce the demand charges for purchased power, and maintain more uniform flows below the Weed Dam. The combined available capacity of the existing Gresham plant and the proposed Weed project is estimated at a monthly range of 513 to 770 kilowatts, 300 kilowatts from the existing plant, and 470 kilowatts from the proposed Weed project (Exhs. 30, 35).

Economic Feasibility

The economic feasibility of the proposed project is determined by comparing the cost to the Village of Gresham of meeting its predicted load increase with and without the proposed Weed project. This in turn involves comparing the annual cost for the proposed hydro project with the cost of purchasing the needed power from the Wisconsin Power & Light Company—the lowest cost alternate source of power. Diesel generation costs about two cents per kilowatt hour. The record shows that the cost to the Village of Gresham of power purchased from Wisconsin Power & Light Company during 1962 and 1963 was 1.76 and 1.61 cents per kilowatt hour, respectively.

Applicant estimates the annual cost for the proposed project at $18,802 per year. However, this does not include the cost of amortizing the 20-year bond issue. Staff derives a maximum annual cost estimate of $26,504 based on amortization of $250,000 in 20 years at 4¼ percent[8] and an annual value of power from the proposed Weed project of $27,682 (Exh. 35). This yields a net annual benefit of $1,178. If, however, the cost of the proposed project is amortized over the conventional 50-year project life, the annual cost for an assumed investment of $250,000 would decline to $22,700. If capital costs are assumed to be $269,000, the annual cost figure would be $23,600; if $300,000, the maximum figure proposed by the Wisconsin State Conservation Commission, the annual cost

---

[8] See the following table:

Interest	$10,625
Amortization 20 yrs. (3.27%)	8,175
Operation & Maintenance	1,100
Taxes	5,480
Insurance	624
Interim Replacements (0.2%)	500
Total	26,504

would be $25,180. Net benefits on a 50-year project life basis at four percent for the various cost estimates in the record may be compared as follows:

Investment	*Net benefit*
$250,000 at 4%	$4,982
$269,000 at 4%	4,082
$277,000 at 4%	3,642
$300,000 at 4%	2,502

Witness Frederick values generation from the Weed project at $21,146, rather than Staff's estimate of $27,682. Substitution of this value would, of course, show a net loss. However, this figure is a minimum estimate and does not assume coordinated operation of the Village projects for peaking purposes (Tr. 246, 251).

Assuming operation of the Village projects to obtain maximum benefits, it is concluded that the project, while marginal, is economically feasible and that net benefits will exceed costs.

Non-Power Aspects of Proposed Project

Section 10(a) of the Federal Power Act[4] requires that the proposed project must be considered not only from the point of view of power costs and benefits but also "other beneficial public uses" including fish and wildlife and recreation. The State Conservation Commission of Wisconsin, interveners, and the Interior Department express concern that the 700-foot stretch of the original stream bed to be by-passed by the powerhouse spillway will become a stretch of dead water deficient in oxygen and harmful to fish life.

Applicant now states (Br. p. 7) that it will provide a flow of 7 cfs of water for this by-passed section of the river. This proposal is criticized by the State Conservation Commission as inadequate to protect fish habitat. Staff notes that provision can be made to provide fresh water for fish in this section of the river, and recommends an appropriate condition in the license for this purpose.

Similarly, State Conservation Commission witness Posekany and the Department of the Interior are concerned over the warming effect of water in the proposed reservoir on downstream fish and game. The area to be inundated by the proposed reservoir is a swampy marsh land covered with tall grass and weeds known as "the flats." The water temperature at the site of the proposed project was measured by Posekany at 79 degrees, a rise from 68–71 degrees, the temperature of the stream above the reservoir area. It is impossible to determine now whether a deeper reservoir over "the flats" would cause a further or lesser warming of the water, or whether the net effect on fish life would be adverse or beneficial.

The proposed project would replace approximately one mile of the Red River and Mill Creek,[5] which presently supports some brook, brown and rainbow trout, with a 235 acre reservoir suitable for bass, panfish and northern pike. Staff concludes that while some trout spawning and fishing area will be lost, "the overall opportunity for fish in the vicinity of Gresham will not be reduced and could be enhanced above the proposed project." (Br. p. 21) No estimate is available as to the number of fish involved.

[4] Section 10(a) of the Federal Power Act provides in pertinent part that all licenses issued shall be subject to the following conditions:

> That the project adopted * * * shall be such that in the judgment of the Commission will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial uses, including recreational purposes; * * *

[5] The chief trout fishing apparently takes place in the fast water above the portion of Mill Creek that will be inundated (Tr. 100, 101, 221, 222).

Since the proposed project is a run of the river plant, the total volume of flow downstream will not be reduced. Swimming and boating should be improved. The Village will provide boat landings, a wading area for children, parking areas on both sides of the dam and powerhouse, picnic and camping facilities (Tr. 71–73, 101–102). The shore line of the proposed reservoir will provide frontage for about 300 cottages.[6] The proposed reservoir will inundate a small falls just upstream of the proposed site. This represents a scenic loss. On the whole, however, public recreational facilities will be improved and enlarged by the proposed project.

The Village of Gresham operates a sewage treatment plant which drains into the upper end of the proposed reservoir (see map). Although there is no evidence of record that this discharge will be harmful, it may be necessary to provide secondary sewage treatment or extend the outfall line to a point below the dam Tr. 103, Exh. 36),[7] and the license will so provide.

Jurisdiction

Applicant concedes Federal jurisdiction. However, the State Conservation Commission of Wisconsin takes the position that such jurisdiction is absent because "the record is devoid of any indication that the Red River * * * has ever been used in interstate commerce." (Br. p. 6) The existence of an uninterrupted waterway through the site of the project to interstate and foreign points is not disputed. In addition, the record shows (Exhs. 25, 26, 28, 29, 32) that many millions of logs have been driven down the Red, into the Wolf River of which it is a tributary, to sawmills in the Lake Winnebago[8] and Fox River area. The Conservation Commission contends there is nothing to show that these logs or lumber were carried beyond the borders of Wisconsin since the sawmills were all within the State. Obviously, local consumption of the forest products processed at these sawmills was negligible. The sawmills shipped their products to all parts of the United States. Actual proof of subsequent shipment in interstate or foreign commerce is not necessary. There is a presumption of interstate commerce. In similar circumstances, the Commission noted:

> We are satisfied that where forest products comprising a large fungible mass are shown to have moved annually along well-defined paths in a stream or flow of commerce to wholesale markets serving several States, as shown here, there is a presumption of interstate commerce raised which attaches to all of the substantial components of the mass. The only outlet for the bulk of the forest products processed at the Glens Falls area mills was along the established channels of commerce, which, in the areas of which we are speaking, led inevitably to interstate trade. (*New York Power and Light Corporation* 8 FPC 231, pp. 238, 239.)

The evidence shows that logs were driven down the Red River past the proposed site and became part of a large mass of logs processed into lumber products which in turn moved into the stream of interstate commerce. This is sufficient to establish navigability within the scope of Section 3(8) of the Federal Power Act. *Wisconsin Public Service Corp.*[9] v. *F.P.C.*, 147 F. 2d 743, cert. den. 325 U.S. 880.

---

[6] Witness Traeger, a former Village President, testified this could result in additional tax revenue of $22,000 per year when fully developed (Tr. 82).

[7] Pursuant to Staff's motion of September 9, 1964, Exhibit 36 is received in evidence.

[8] Lake Winnebago is connected to Lake Michigan by the Fox River. (See map.)

[9] After applying the tests enumerated in the cases cited we believe that the evidence as shown by this record establishes a long, regular, and commercially successful use of the stream for the transportation of logs and rafts and forms a reasonable basis in law for the conclusion that the Wisconsin River was and is a navigable water of the United States (*Wisconsin Public Service Corp.* v. *Federal Power Commission*, 147 F. 2d 743, 748, cert. den. 325 U.S. 880). See also *Wisconsin Michigan Power Co.* 3 FPC 449.

Conversely, the record shows evidence of interstate traffic up the Wolf River to Shawano. *The Wisconsin Lumberman* stated (p. 290) in February 1874:

> Shawano is the head of navigation of the Wolf River, and is and must of necessity, remain the terminus of the river carrying trade. All heavy freight is now brought by steamboat and barge from the lakes or Mississippi river to our village without breaking bulk, and goods purchased in New York and shipped by way of the lakes reach us by water and are landed within the village, thus enabling our merchants to sell heavy freights at a low price as compared with the markets of other inland towns where such goods are caraied [sic] over rough roads. (Exh. 25)

In addition, numerous witnesses testified that the Red River has been and is used extensively for canoeing.

As defined in Section 3(8) of the Federal Power Act:

> "navigable waters" means those parts of streams or other bodies of water over which Congress has jurisdiction under its authority to regulate commerce with foreign nations and among the several States, and which either in their natural or improved condition, notwithstanding interruptions between the navigable parts of such streams or waters by falls, shallows, or rapids compelling land carriage, are used or suitable for use of the transportation of persons or property in interstate or foreign commerce, including therein all such interrupting falls, shallows, or rapids, together with such other parts of streams as shall have been authorized by Congress for improvement by the United States or shall have been recommended to Congress for such improvement after investigation under its authority.

The Red River has been used and is suitable for use for the transportation of persons or property in interstate or foreign commerce, and consequently is "navigable" within the meaning of Section 23(b) of the Federal Power Act which bars construction of the proposed project absent a license granted pursuant to the Act.

CONCLUSION

The proposed project has been approved by the Wisconsin Public Service Commission, as well as the Village of Gresham. Adequate financing has been arranged and $74,880, of the total Staff estimated cost of $269,000, already expended. The project expands the existing Gresham plant and its economic feasibility depends upon coordinated use of the two plants for peaking operations. While trout fishing may be adversely affected, overall fishing and recreational facilities in the area probably will be improved with the proposed project. Accordingly, a license is recommended, subject to specific conditions designed to assure comprehensive development in the public interest pursuant to Section 10(a) of the Federal Power Act.

ADDITIONAL FINDINGS AND CONCLUSIONS

Upon consideration of the entire record in this proceeding, including the pleadings, the evidence adduced, and the briefs filed, it is found and concluded, in addition to the findings and conclusions heretofore stated, that:

(1) The Red River in Wisconsin is navigable from its confluence with the Wolf River upstream through the project site to a point beyond the Village of Gresham, Wisconsin.

(2) The Red River has historically been used to transport logs, some of which passed into interstate commerce, and is still used for canoeing.

(3) The Red River is suitable and capable of continuous and uninterrupted use for transportation of products in interstate commerce through the Wolf River, through Lake Poygan, Lake Winnoconne, Lake Winnebago, and then to

points in other states through the Fox River into Lake Michigan, and is a navigable waterway of the United States within the meaning of Section 3(8) of the Federal Power Act.

(4) Under the provisions of Section 23(b) of the Federal Power Act the Applicant, the Village of Gresham may not construct, operate or maintain a project at the proposed site until a license shall be obtained therefor pursuant to this Act.

(5) Public notice of these proceedings has been given as required by the Act.

(6) The Applicant is a municipality organized under the laws of the State of Wisconsin, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the proposed project.

(7) The proposed project does not affect a Government dam, nor will the issuance of a license affect the development of any water resources for public purposes which should be undertaken by the United States.

(8) The proposed Project No. 2464, also known as the Weed Dam would be located just west of a point where a town road crosses the Red River about a mile and a half east of the Village of Gresham.

(9) The proposed project would consist of a dam consisting of a concrete center section flanked by two earth dikes, and would form a reservoir of approximately 235 acres with a gross power head of about 25 feet developing a total capacity of 470 kilowatts from two turbines having a total rating of 800 horsepower.

(10) The project structures proposed by the Applicant would be safe and stable if constructed pursuant to usual engineering methods and practices.

(11) Subject to the terms and conditions set forth below, the plans of the Applicant to develop the Weed site are best adapted to conserve and utilize in the public interest the water resources involved for the use or benefit of interstate commerce, for the improvement and utilization of water power development, and for other beneficial public uses, including recreational purposes under Section 10(a) of the Federal Power Act.

(12) The amount of annual charges to be paid under the license for the purpose of reimbursing the United States for the costs of administration of Part I of the Act is reasonable as hereinafter fixed and specified.

(13) The Applicant shall make provision for release of fresh water into the section of the Red River bypassed by the tailrace for the benefit of fish life.

(14) The Applicant shall take any measures necessary to prevent the discharge of its sewage treatment plant from having a harmful effect on the use of the reservoir for recreational purposes.

(15) The Applicant shall devise a method of operation to prevent fluctuations in flow below the Weed Dam from endangering life and property.

(16) It will be in the public interest to waive pursuant to Section 10(i) of the Act the terms and conditions contained in the following sections of Part I of the Act:

Section 4(b), except the second sentence thereof; 4(e) insofar as it relates to approval of plans by the Chief of Engineers and the Secretary of the Army and to public notice; 6, insofar as it relates to public notice and to the acceptance and expression in the license of terms and conditions of the Act which are hereinafter waived; 10(c), insofar as it relates to depreciation reserves; 10(d); 10(f); 14, except insofar as the power of condemnation is reserved; 15; 19; 20; 22; and 23(a), insofar as it relates to the determination of fair value.

(17) The exhibits designated and described in paragraph (B) below, which were included as part of Exhibit 2 of the hearing record, substantially conform

to the Commission's Rules and Regulations and should be approved as part of the license for the project.

ORDER

WHEREFORE, *it is ordered*, subject to review by the Commission on appeal, or upon its own motion, as provided in the Commission's Rules of Practice and Procedure that:

(A) This license is hereby issued to the Village of Gresham, Wisconsin under Sections 4(e) and 10(i) of the Act, for a period of 50 years effective as of the first day of the month in which the Commission acts on the application for license for the continued operation and maintenance of Project No. 2464, located on the Red River, a navigable water of the United States, subject to the terms and conditions of the Act insofar as not expressly waived herein, which Act is incorporated herein by reference as a part of this license, and subject to such Rules and Regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Project No. 2464 consists of:

(i) all lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined.

(ii) a combination concrete gravity and earth dam about 1,505 feet long; two penstocks extending from the intake at the dam to a powerhouse containing two units, one rated 120 kilowatts and one rated 350 kilowatts, operating under a normal head of about 25 feet; and all other structures, fixtures, equipment or facilities used or useful in the operation and maintenance of the project and located on the project area; and all right and interests therein, the possession of which is necessary in the maintenance and operation of the project. The location, nature, and character of the project structures are more specifically shown and described by the exhibits which formed part of Exhibit 2 of the hearing record and which are designated and described as follows:

Exhibit	FPC No. 2464	Applicant's dwg. No.	Showing
L–1	3	WI06–C4.1	Project layout.
L–2	4	WI06–C5.1	General plan.
L–3	5	WI06–C6.1	Spillway and walls.

(C) The Licensee is also subject to the terms and conditions of the following articles, which terms and conditions, designated as Articles 1 through 31 are made a part hereof:

Article 1. The entire project, as described in the order of the Commission, shall be subject to all the provisions, terms, and conditions of the license.

Article 2. No substantial change shall be made in the maps, plans, specifications, and statements described and designated as exhibits and approved by the Commission in its order as a part of the license until such change shall have been approved by the Commission: Provided, however, that if the Licensee or the Commission deems it necessary or desirable that said approved exhibits, or any of them, be changed, there shall be submitted to the Commission for approval amended, supplemental, or additional exhibit or exhibits covering the proposed changes which, upon approval by the Commission, shall become a part of the license and shall supersede, in whole or in part, such exhibit or exhibits theretofore made a part of the license as may be specified by the Commission.

Article 3. Said project works shall be constructed in substantial conformity with the approved exhibits referred to in Article 2 herein or as changed in ac-

cordance with the provisions of said article. Except when emergency shall require for the protection of navigation, life, health, or property, no substantial alteration or addition not in conformity with the approved plans shall be made to any dam or other project works under the license without the prior approval of the Commission; and any emergency alteration or addition so made shall thereafter be subject to such modification and change as the Commission may direct. Minor changes in the project works or divergence from such approved exhibits may be made if such changes will not result in decrease in efficiency, in material increase in cost, or in impairment of the general scheme of development; but any of such minor changes made without the prior approval of the Commission, which in its judgment have produced or will produce any of such results, shall be subject to such alteration as the Commission may direct. The Licensee shall comply with such rules and regulations of general or special applicability as the Commission may from time to time prescribe for the protection of life, health, or property.

Article 4. The construction, operation, and maintenance of the project and any work incident to additions or alterations, whether or not conducted upon lands of the United States, shall be subject to the inspection and supervision of the Regional Engineer, Federal Power Commission, in the region wherein the project is located, or of such other officer or agent as the Commission may designate, who shall be the authorized representative of the Commission for such purposes. The Licensee shall furnish to said representative such information as he may require concerning the construction, operation, and maintenance of the project, and of any alteration thereof, and shall notify him of the date upon which work will begin, and as far in advance thereof as said representative may reasonably specify, and shall notify him promptly in writing of any suspension of work for a period of more than one week, and of its resumption and completion. The Licensee shall allow him and other officers or employees of the United States, showing proper credentials, free and unrestricted access to, through, and across the project lands and project works in the performance of their official duties.

Article 5. So far as is consistent with proper operation of the project, the Licensee shall allow the public free access, to a reasonable extent, to project waters and adjacent project lands owned by the Licensee for the purpose of full public utilization of such lands and waters for navigation and recreational purposes, including fishing and hunting, and shall allow to a reasonable extent for such purposes the construction of access roads, wharves, landings, and other facilities on its lands the occupancy of which may in appropriate circumstances be subject to payment of rent to the Licensee in a reasonable amount: Provided that the Licensee may reserve from public access, such portions of the project waters, adjacent lands, and project facilities as may be necessary for the protection of life, health, and property and provided further, that the Licensee's consent to the construction of access roads, wharves, landings, and other facilities shall not, without its express agreement, place upon the Licensee any obligation to construct or maintain such facilities. These facilities are in addition to the facilities that the Licensee may construct and maintain as required by the license.

Article 6. Insofar as any material is dredged or excavated in the prosecution of any work authorized under the license, or in the maintenance of the project, such material shall be removed and deposited so it will not interfere with navigation, and will be to the satisfaction of the District Engineer, Department of the Army, in charge of the locality.

Article 7. The United States specifically retains and safeguards the right to use water in such amount, to be determined by the Secretary of the Army, as

may be necessary for the purposes of navigation on the navigable waterway affected; and the operations of the Licensee, so far as they affect the use, storage and discharge from storage of waters affected by the license, shall at all times be controlled by such reasonable rules and regulations as the Secretary of the Army may prescribe in the interest of navigation, and as the Commission may prescribe for the protection of life, health, and property, and in the interest of the fullest practicable conservation and utilization of such waters for power purposes and for other beneficial public uses, including recreational purposes; and the Licensee shall release water from the project reservoir at such rate in cubic feet per second, or such volume in acre-feet per specified period of time, as the Secretary of the Army may prescribe in the interest of navigation, or as the Commission may prescribe for the other purposes hereinbefore mentioned.

Article 8. Whenever the United States shall desire, in connection with the project, to construct fish and wildlife facilities or to improve the existing fish and wildlife facilities at its own expense, the Licensee shall permit the United States or its designated agency to use, free of cost, such of Licensee's lands and interest in lands, reservoirs, waterways and project works as may be reasonably required to complete such facilities or such improvements thereof. In addition, after notice and opportunity for hearing the Licensee shall modify the project operation as may be prescribed by the Commission, reasonably consistent with the primary purpose of the project, in order to permit the maintenance and operation of the fish and wildlife facilities constructed or improved by the United States under the provision of this article. This article shall not be interpreted to place any obligation on the United States to construct or improve fish and wildlife facilities or to relieve the Licensee of any obligation under the license.

Article 9. If the Licensee shall cause or suffer essential project property to be removed or destroyed or to become unfit for use, without replacement, or shall abandon or discontinue good faith operation of the project for a period of three years, or refuse or neglect to comply with the terms of the license and the lawful orders of the Commission mailed to the record address to the Licensee or its agent, the Commission will deem it to be the intent of the Licensee to surrender the license, and not less than 90 days after public notice may in its discretion terminate the license.

Article 10. Upon abandonment of the project the Licensee shall remove all buildings, equipment and power lines to a condition satisfactory to the Commission's authorized representative and shall fulfill such other obligations under the license as the Commission may prescribe.

Article 11. Whenever the United States shall desire to construct, complete, or improve navigation facilities in connection with the project, the Licensee shall convey to the United States, free of cost, such of its lands and its rights-of-way and such right of passage through its dams or other structures, and permit such control of pools as may be required to complete and maintain such navigation facilities.

Article 12. The Licensee shall furnish free of cost to the United States power for the operation and maintenance of navigation facilities at the voltage and frequency required by such facilities and at a point adjacent thereto whether said facilities are constructed by the Licensee or by the United States.

Article 13. The operation of any navigation facilities which may be constructed as a part of or in connection with any dam or diversion structure constituting a part of the project works shall at all times be controlled by such reasonable rules and regulations in the interest of navigation, including the control of the level of the pool caused by such dam or diversion structure, as may be made from time to time by the Secretary of the Army.

Article 14. The Licensee shall for the protection of navigation, construct, maintain and operate at its own expense such lights and other signals on fixed structures in or over navigable waters of the United States as may be directed by the Secretary of the Department in which the Coast Guard is operating.

Article 15. The Licensee shall, after notice and opportunity for hearing, coordinate the operation of the project, electrically and hydraulically, with such other power systems and in such manner as the Commission may direct in the interest of power and other beneficial public uses of water resources, and on such conditions concerning the equitable sharing of benefits by the Licensee as the Commission may order.

Article 16. The Licensee shall, for the conservation, and development of fish and wildlife resources, construct, maintain, and operate, or arrange for the construction, maintenance and operation of such facilities and comply with such reasonable modifications of the project structures and operation as may be ordered by the Commission upon its own motion or upon the recommendation of the Secretary of the Interior or the fish and wildlife agency or agencies of any State in which the project or a part thereof is located, after notice and opportunity for hearing and upon findings based on substantial evidence that such facilities and modifications are necessary and desirable, reasonably consistent with the primary purpose of the project, and consistent with the provisions of the Act.

Article 17. The Licensee shall construct, maintain and operate or shall arrange for the construction, maintenance and operation of such recreational facilities including modifications thereto, such as access roads, wharves, launching ramps, beaches, picnic and camping areas, sanitary facilities and utilities, as may be prescribed hereafter by the Commission during the term of this license upon its own motion or upon the recommendation of the Secretary of the Interior or other interested Federal and State agencies, after notice and opportunity for hearing and upon findings based upon substantial evidence that such facilities are necessary and desirable, and reasonably consistent with the primary purpose of the project.

Article 18. The Licensee shall be responsible for and shall minimize soil erosion and siltation on lands adjacent to the stream resulting from the construction and operation of the project. The Commission upon request, or upon its own motion, may order the Licensee to construct and maintain such preventive works to accomplish this purpose and to revegetate exposed soil surface as the Commission may find to be necessary after notice and opportunity for hearing.

Article 19. No lease of the project or any part thereof whereby the Lessee is granted the occupancy, possession, or use of the project, or any part thereof, shall be made without prior written approval of the Commission; and the Commission may, if in its judgment the situation warrants, require that all the conditions of the license, of the Act, and of the Rules and Regulations of the Commission shall be applicable to such property so leased to the same extent as if the Lessee were the Licensee: Provided, that the provisions of this article shall not apply to leases of land or buildings or other property while not required to achieve the purposes of the license.

Article 20. Upon the completion of the project, or at such other time as the Commission may direct, the Licensee shall submit to the Commission for approval revised maps, plans, specifications, and statements insofar as necessary to show any divergence from or variations in the project area and project boundary as finally located or in the project works as actually constructed when compared with the area and boundary shown and the works described in the license or in the maps, plans, specifications, and statements approved by the Commission, together with a statement in writing setting forth the reasons which in the

opinion of the Licensee necessitated or justified variations in or divergence from the approved maps, plans, specifications, and statements. Such revised maps, plans, specifications, and statements shall, if and when approved by the Commission, be made a part of the license under the provisions of Article 2 hereof.

Article 21. The Licensee shall furnish to the Commission within 60 days from the effective date of this license, tracings of the Exhibit L drawings listed herein under paragraph (B)(ii).

Article 22. In the construction and maintenance of the project works, the Licensee shall place and maintain suitable structures and devices to reduce to a reasonable degree the liability of contact between its transmission lines, and telegraph, telephone, and other signal wires or power transmission lines constructed prior to its transmission lines and not owned by the Licensee, and shall also place and maintain suitable structures and devices to reduce to a reasonable degree the liability of any structures or wires falling and obstructing traffic and endangering life on highways, streets, or railroads. None of the provisions of this article is intended to relieve the Licensee from any responsibility or requirement which may be imposed by other lawful authority for avoiding or eliminating inductive interference.

Article 23. The Licensee shall do everything reasonably within its power and shall require its employees, contractors, and employees of contractors to do everything reasonably within their power, both independently and upon request of officers of the agency of the United States concerned, to prevent, make advanced preparations for suppression, and suppress fires on lands occupied under the license.

Article 24. For the purpose of determining the stage and flow of the stream or streams from which water is diverted for the operation of the project works, the amount of water held in and withdrawn from storage, and the effective head on the turbines, the Licensee shall install and thereafter maintain such gages and stream-gaging stations as the Commission may deem necessary and best adapted to the requirements; and shall provide for the required readings of such gages and for adequate rating of such stations. The Licensee shall also install and maintain standard meters adequate for the determination of the amount of electric energy generated by said project works. The number, character, and location of gages, meters, or other measuring devices, and the method of operation thereof, shall at all times be satisfactory to the Commission and may be altered from time to time if necessary to secure adequate determinations, but such alteration shall not be made except with the approval of the Commission or upon the specific direction of the Commission. The installation of gages, the ratings of said stream or streams, and the determination of the flow thereof, shall be under the supervision of, or in cooperation with, the District Engineer of the United States Geological Survey having charge of stream-gaging operations in the region of said project, and the Licensee shall advance to the United States Geological Survey the amount of funds estimated to be necessary for such supervision or cooperation for such periods as may be mutually agreed upon. The Licensee shall keep accurate and sufficient record of the foregoing determinations to the satisfaction of the Commission, and shall make return of such records annually at such time and in such form as the Commission may prescribe.

Article 25. The right of the Licensee and of its transferees and successors to use or occupy navigable waters of the United States under the license for the purpose of maintaining the project works or otherwise, shall absolutely cease at the end of the license period, unless a new license is issued pursuant to the then existing laws and regulations.

Article 26. The terms and conditions expressly set forth in the license shall not be construed as impairing any terms and conditions of the Federal Power Act which are not expressly waived in the license.

Article 27. The Licensee shall pay to the United States the following annual charge:

(i) For the purpose of reimbursing the United States for the costs of Administration of Part I of the Act $31.30.

Article 28. Licensee shall make provision to supply initially, a continuous flow of not less than 7 cubic feet per second for the benefit of fish in the bypassed 700-foot stretch of river located between the Weed Dam and the end of the tailrace and shall submit the plans to the Commission before construction of the project commences. Licensee shall, after construction of the project, undertake a study with the Wisconsin Conservation Department to determine whether greater flows are necessary to prevent fish kill in this stretch of river.

Article 29. Licensee shall submit a plan for the protection of life and property downstream of the project for those periods when operation of the powerhouse is expected to cause substantial streamflow fluctuations and shall submit such plan to the Commission for approval.

Article 30. The Licensee shall within one year from the date of issuance of the license, file with the Commission for approval its proposed recreational use plan for the project. The plan shall be prepared after consultation with appropriate Federal, State and local agencies, and shall include recreational improvements which may be provided by others in addition to the improvements the Licensee plans to provide.

Article 31. Licensee shall take corrective measures at any time the discharge of effluent from its sewage treatment plant has a harmful effect on the use of the reservoir for recreational purposes.

(D) The exhibits designated and described in paragraph (B) above are hereby approved as part of the license.

(E) The terms and conditions of the Act, which it is found above to be in the public interest to waive, are hereby excluded from this license.

(F) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgment of the acceptance of this license, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of issuance of this order.

WILLIAM C. LEVY,
Presiding Examiner.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

ILLINOIS POWER COMPANY AND MISSISSIPPI RIVER TRANSMISSION CORPORATION, DOCKET NO. CP65-343

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued July 13, 1965)

On April 27, 1965, Illinois Power Company (Applicant) filed in Docket No. CP65-343 an application pursuant to Section 7(a) of the Natural Gas Act for

an order of the Commission directing Mississippi River Transmission Corporation (Respondent) to establish physical connection of its transmission facilities with the proposed facilities of and to sell and deliver natural gas at such connection to Applicant for resale and distribution in the Village of Valmeyer, and environs, Monroe County, Illinois, all as more fully set forth in the application.

Applicant proposes to construct and operate 8.5 miles of 3-inch lateral line, as well as the necessary distribution facilities, in order to render service to Valmeyer and environs.

The total estimated third year peak day and annual natural gas requirements for Valmeyer and environs is 225 Mcf and 17,814 Mcf, respectively.

The total estimated cost of the proposed project is $233,845, which cost will be financed from funds available for construction.

Applicant does not request an additional allocation of gas from Respondent; gas delivered at the proposed interconnection will be part of Applicant's presently effective contract demand with Mississippi.

Applicant states that it has received a certificate of public convenience and necessity from the Illinois Commerce Commission and a franchise from Valmeyer.

On June 2, 1965, Respondent filed an answer to the subject application stating that it does not object to rendering the requested service.

Due notice of the filing of the application and opportunity for hearing thereon has been given by publication in the Federal Register on May 12, 1965 (30 F.R. 6555). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

(1) Respondent, Mississippi River Transmission Corporation, a Delaware corporation having its principal place of business in St. Louis, Missouri, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of November 29, 1960, in Docket No. CP60-95 (24 FPC 1020).

(2) Applicant, Illinois Power Company, is a public utility duly organized and existing under the laws of the State of Illinois and is authorized to engage in the business of distributing and selling natural gas within said State.

(3) It is necessary and desirable in the public interest that Respondent be directed to establish physical connection of its natural gas transmission system with the proposed facilities of Applicant and to sell and deliver at such connection up to 225 Mcf of natural gas per day to Applicant, as set forth in the application and as hereinafter ordered and conditioned.

(4) Applicant should be prepared to receive natural gas from Respondent within one year from the date of issuance of this order.

(5) The requirement that Respondent serve Applicant, as proposed, will not place any undue burden upon Respondent nor impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) Respondent, Mississippi River Transmission Corporation is hereby directed to establish physical connection of its natural gas transmission system with the proposed facilities of Applicant and to sell and deliver at such connection up to 225 Mcf of natural gas per day to Applicant, all as hereinbefore described and as more fully set forth in the application in this proceeding.

(B) Applicant shall be prepared to receive natural gas from Respondent within one year from the date of issuance of this order.

(C) Respondent shall report to the Commission in writing the date of commencement of service to Applicant within ten days thereof.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

INDIANA NATURAL GAS CORPORATION AND TEXAS EASTERN TRANSMISSION CORPORATION, DOCKET NO. CP63-292

ORDER AMENDING ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued July 13, 1965)

By Commission order issued July 29, 1964, 32 FPC 440, in Docket No. CP63-292, Texas Eastern Transmission Corporation (Respondent) was directed to establish physical connection of its transmission system with the facilities of Indiana Natural Gas Corporation (Applicant) and to sell and deliver a maximum of 2,173 Mcf of natural gas per day to Applicant for resale and distribution in the towns of French Lick and West Baden Springs, Indiana and their environs. The order was conditioned upon Applicant's filing with the Commission a contract between it and French Lick Sheraton Hotel (Sheraton), one of Applicant's prospective customers.

On December 23, 1964, Applicant filed herein a petition, as supplemented April 2, 1965, to amend said order by deleting therefrom the requirement that it file a contract between it and Sheraton and by reducing the volume of gas authorized to be delivered to it from Texas Eastern from a maximum of 2,173 Mcf per day to a maximum of 737 Mcf per day. This reduction in volume is requested due to Applicant's inability to reach agreement with Sheraton, and due to the closing of West Baden College, another prospective customer of Applicant.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the petition has been filed.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the order of the Commission issued July 29, 1964, in Docket No. CP63-292 be amended as hereinafter ordered.

The Commission orders:

(A) The order of the Commission issued July 29, 1964, in Docket No. CP63-292 is hereby amended by reducing the volume of natural gas to be delivered by Respondent, Texas Eastern Transmission Corporation to Applicant from a maximum of 2,173 Mcf per day to a maximum of 737 Mcf per day, and by deleting from said order the requirement that Applicant file with the Commission a contract between it and French Lick Sheraton Hotel.

(B) In all other respects said order shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

PACIFIC GAS & ELECTRIC COMPANY, PROJECT NO. 2106

ORDER APPROVING REVISED PROJECT EXHIBITS, ADJUSTING AUTHORIZED INSTALLED CAPACITY AND ANNUAL CHARGES, AND REDESCRIBING PROJECT DEVELOPMENTS

(Issued July 13, 1965)

On August 19, 1963, Pacific Gas & Electric Company, licensee for Project No. 2106, filed an application for Commission approval of Revised Exhibits L and M

showing design modifications and changes relating to the proposed McCloud-Pit development of the project. On July 23, 1964, the licensee filed for Commission approval a revised Exhibit L drawing relating to the Iron Canyon Dam and Reservoir. Project No. 2106 includes the proposed McCloud-Pit development on the McCloud and Pit Rivers and proposed Pit No. 6 and 7 developments on the Pit River.

The proposed changes shown on the revised exhibits were found necessary and desirable as a result of further engineering studies and exploratory drillings made subsequent to issuance of the license for the project and which will facilitate construction and reduce construction costs. The principal changes involve: (1) change in the McCloud Diversion Dam from a concrete arch type to an earth and rockfill type with a change in the spillway radial gates and a spillway discharge channel providing spillway capacity comparable to that presently authorized, and the addition of facilities for releasing fish water from McCloud Reservoir from different elevations for temperature control as required by Article 45 of the license; (2) modifications relating to the Iron Canyon development consisting of a widening of the dam crest with provision for a roadway over the dam, a change in the spillway design from an ungated side-channel type to a lined tunnel-type discharging into another creek away from the dam to provide for comparable spillway capacity at a more favorable foundation site and to afford more protection to the dam, and a change in the design of the Iron Canyon tunnel surge chamber from a two barrel differential type to a single barrel differential type which utilizes an overflow basin with a savings in cost; and (3) modifications to the McCloud-Pit development consisting of changes in the diameters and plate thicknesses of the powerhouse penstock made necessary by the relocation of the powerhouse approved by Commission order issued January 31, 1964, a change in the powerhouse installation from 155.7 mw. (2 units of 77.85 mw. each) to 154.8 mw. (2 units of 77.4 mw. each), a change in the main transformers from single phase to three phase type with a savings in cost, and a change from two single circuit transmission lines to one single circuit line about one-half mile long. The proposed modifications are appropriate, subject to the inclusion in the license of additional articles as hereinafter provided.

The Chief of Engineers and the Secretary of the Army have reported that the plans of the project structures affecting navigation have been approved pursuant to Section 4(e) of the Federal Power Act insofar as the interests of navigation are concerned.

The Department of the Interior, in letter dated November 10, 1964, reported that the proposed structural change of the McCloud diversion dam, from a concrete arch dam to an earth and rock-fill dam, could result in significant losses to the downstream fish resources and related recreational values through excessive siltation and debris deposition induced by construction activities, particularly if hydraulic rock-washing techniques were employed, and the Department requested that a condition be added to the license to take care of these matters. The license for Project No. 2106 was further amended by Commission order issued April 1, 1965, to include, among other things, Article 50 which satisfies the request of the Department.

The California Department of Fish and Game has offered no objection to the aforementioned change in plans for controlling the water temperature below the McCloud diversion dam in the interest of fish life.

By its order issued August 15, 1963, 30 FPC 493, the Commission provided for future adjustment of the authorized installed capacity of Project No. 2106 for annual charge purposes and revision of the description of the several developments comprising the project. By its order issued August 15, 1963, the authorized installed capacity of the Pit No. 6 development was increased from

73.8 mw. (2 units of 36.9 mw. each) to 79.2 mw. (2 units of 39.6 mw. each), and the authorized installed capacity of the Pit No. 7 development was increased from 99.9 mw. (2 units of 49.95 mw. each) to 104.4 mw. (2 units of 52.2 mw. each).

The Commission finds:

(1) The following described revised exhibits conform to the Commission's rules and regulations and should be approved as part of the license for the project:

Exhibit	F.P.C. No.	Title—McCloud-Pit Development—Proj. No. 2106
L–1A	2106–55	McCloud Diversion Dam.
L–2A	2106–56	McCloud Tunnel Intake and Hawkins Creek Crossing.
L–3B	2106–60	Iron Canyon Dam, Intake and Tunnel and Spillway.
L–4A	2106–58	Profile of Iron Canyon Pipe Crossing, McCloud-Pit Penstock and Surge Chamber.
L–5A	2106–59	McCloud-Pit Power House.
M–2		Entitled "General Descriptions and General Specifications of Mechanical, Electrical and Transmission Equipment, McCloud-Pit Development."

(2) The following described exhibits which are now part of the license and which have been superseded should be eliminated from the license to the extent herein indicated:

Exhibits L–1, L–2, L–3, L–4, and L–5 (FPC Nos. 2106–27 through –31), and Exhibit M filed with the Commission on April 1, 1957, insofar as it relates to the McCloud-Pit Development.

(3) The presently authorized installed capacity of the project for the purpose of computing the capacity component of the administrative annual charge is by this order increased from 439,000 horsepower to 451,000 horsepower, and the amount of annual charges, based upon such increased capacity, to be paid under the license for the project, for the costs of administration of Part I of the Act is reasonable.

The Commission orders:

(A) The revised exhibits described in finding (1) above are hereby approved as part of the license for the project, and the exhibits described in finding (2) above are hereby eliminated from the license to the extent therein indicated.

(B) The project works comprising the McCloud-Pit and Pit Nos. 6 and 7 developments consist of:

McCloud-Pit Development

McCloud Diversion Dam and Reservoir, an earth and rock-fill dam in McCloud River about 500 feet upstream from Lizzard Creek, a seven-foot diameter sluice through the right abutment, a spillway with five radial gates, and a reservoir with an area of 520 acres at maximum water surface elevation of 2680 feet and a gross capacity of 35,300 acre-feet of storage; *McCloud Tunnel*, a horseshoe and/or circular tunnel about 37,800 feet long and 17 feet in diameter when unlined and 13 feet in diameter when lined extending from an intake in McCloud Reservoir to Iron Canyon Reservoir; *Iron Canyon Dam and Reservoir*, an earth-fill dam on Iron Canyon Creek four miles north of Pit No. 5 plant on Pit River, a four-foot diameter sluice pipe through the dam, a lined tunnel-type spillway, and a reservoir with an area of 500 acres at maximum water surface elevation 2665 feet and a gross capacity of 24,400 acre-feet of storage; *Iron Canyon Tunnel*, a horseshoe and/or circular tunnel about 15,300 feet long and 18 feet in diameter when unlined and 14 feet in diameter when lined extending from an intake in Iron Canyon Reservoir to the head of the penstock; a steel penstock varying from 11.5 feet to 10 feet in diameter about 5100 feet long branching at a wye to two

seven-foot diameter penstocks extending about 100 feet to the powerhouse; a surge chamber located near the downstream end of Iron Canyon Tunnel; the *McCloud-Pit Powerhouse*, located about one-half mile upstream from Pit No. 5 power plant, containing two 104,000-horsepower turbines connected to two 77,400-kilowatt generators (86,000 kva. @ 0.9 P.F.); a substation and switchyard; one single circuit 220 kv. transmission line extending about one-half mile from the switchyard to the existing transmission line leading from the Pit No. 5 power plant; and appurtenant mechanical and electrical facilities;

Pit No. 6 Development

A concrete gravity dam located in Pit River about 2½ miles upstream from Marble Creek with an overflow gated spillway; two gated sluice conduits through the dam; a reservoir with normal water surface elevation at 1425 feet (U.S.G.S. datum), an area of about 265 acres and a gross capacity of about 15,700 acre-feet of storage; a tunnel; steel penstocks; a powerhouse located 300 feet downstream from the dam containing two 53,000 horsepower turbines connected to two 39,600-kilowatt generators (44,000 kva. @ 0.9 P.F.) installed therein; a substation and switchyard; two single circuit 220 kv. transmission lines extending about 3.3 miles from the switchyard to the Applicant's interconnected transmission system; and appurtenant mechanical and electrical facilities;

Pit No. 7 Development

A concrete gravity dam, located in Pit River about 2½ miles downstream from Montgomery Creek, with an overflow gated spillway; two gated sluice conduits through the dam; a reservoir with normal water surface at elevation 1270 feet (U.S.G.S. datum) and a total capacity of 34,000 acre-feet of storage; a tunnel about 560 feet long; steel penstocks; a powerhouse located 500 feet downstream from the dam containing two 70,000-horsepower turbines connected to two 52,200-kilowatt generators (58,000 kva. @ 0.9 P.F.); a substation and switchyard; two single circuit 220 kv. transmission lines extending 3½ miles from the switchyard to the Applicant's interconnected transmission system; a low rockfill over-pour afterbay dam including a variable width concrete gravity weir section, located about two miles downstream from the main dam; and appurtenant mechanical and electrical facilities:

(C) Subparagraph (i) of Article 28 of the license is hereby modified, effective as of January 1, 1965, by substituting "451,000 horsepower" for "439,000 horsepower" as the authorized installed capacity of the project for annual charge purposes.

(D) The following articles are hereby included in the license for the project:

Article 49. The Licensee shall install at least two rows of piezometer wells with at least two wells per row in the downstream portion of the Iron Canyon dam in order to check on the functioning of the drainage system and shall submit to the Commission monthly readings of the water surface elevations in the wells;

Article 50. The Licensee shall install small weirs below the McCloud diversion and the Iron Canyon dams and shall measure the seepage and turbidity of the water draining from the dams. Measurements shall be made monthly for the first year of operation and any unusual change shall be reported immediately to the Commission;

Article 51. The Licensee shall install several monuments on the crest of the Iron Canyon dam and shall measure each month vertical and horizontal movements for the first two years of operation, and shall submit such measurements to the Commission semiannually; and

Article 52. The Licensee shall submit stability analyses for the McCloud diversion and Iron Canyon dams using material and foundation strengths found during construction, and shall modify the designs of the dams, if found necessary,

in order to provide a factor of safety against sliding of at least 1.5 for conditions of maximum normal water surface elevations and without effects of earthquake, and at least 1.2 for similar conditions including effects of earthquake.

(E) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this order. In acknowledgment of the acceptance of this order, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOUTHEASTERN KANSAS GAS COMPANY, INC., DOCKET NO. CP65-368

DECLARATION OF EXEMPTION

(Issued July 13, 1965)

Southeastern Kansas Gas Company, Inc. (Applicant) filed an application on May 20, 1965, for exemption from the provisions of the Natural Gas Act, pursuant to Section 1(c) thereof.

Applicant is a Kansas corporation engaged in the transportation and distribution of natural gas in the State of Kansas. Pursuant to certificate authorization granted by the Federal Power Commission, Cities Service Gas Company sells and delivers to applicant natural gas for resale in Kansas.

Applicant serves its market by means of a transmission system extending from a point of connection with Cities Service Gas Company in the NE corner of Section 26, Bourbon County, Kansas, to points of distribution in the cities of Bronson in Bourbon County, Moran in Allen County, Blue Mound in Linn County, Walnut in Crawford County, and St. Paul in Neosho County, all in the State of Kansas.

All natural gas received by Applicant for transportation and distribution through its said system is consumed ultimately within the State of Kansas, and all of its said facilities are located within said state.

The Kansas State Corporation Commission has certified to the Federal Power Commission that it has and will be exercising regulatory jurisdiction over the rates, service and facilities of Applicant.

Wherefore, the Commission declares, by reason of the foregoing:

Southeastern Kansas Gas Company, Inc. is exempt from the provisions of the Natural Gas Act, and the orders, rules and regulations of this Commission issued thereunder.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOUTHERN CALIFORNIA EDISON COMPANY, PROJECT NOS. 174 AND 2290

ORDER ACCEPTING SURRENDER OF LICENSE (TRANSMISSION LINE) AND PRESCRIBING ANNUAL TRANSMISSION LINE CHARGES IN LICENSE (MAJOR)

(Issued July 13, 1965)

Application was filed on May 21, 1965, by Southern California Edison Company for surrender of its license for transmission line Project No. 174 since all of the

transmission facilities under the license for Project No. 174 were, by Commission order issued August 7, 1964, 32 FPC 553, included as part of the project works covered under Southern California's license for major Project No. 2290.

Annual charges under the license for Project No. 174 for the occupancy by the transmission facilities of National Forest lands (Sequoia National Forest) have been paid by the licensee for that project through December 31, 1964. The licensee's copy of the license instrument for Project No. 174 and the three amendments thereto were returned with the application for surrender.

The transmission facilities included under the license for Project No. 2290 by the aforementioned August 7, 1964, Commission order occupy an equivalent 100-foot wide right-of-way 9.64 miles long on National Forest lands.

Subparagraph (iii) of Article 44 of the license for Project No. 2290 reserves to the Commission the right to determine at a later date the amount of annual charges to be paid for recompensing the United States for the use, occupancy and enjoyment of its lands for transmission line right-of-way purposes. We are herein prescribing the amount of annual charges to be paid under the license for Project No. 2290 for transmission line occupancy.

The Commission finds:

Acceptance of surrender of the license for transmission line Project No. 174 is appropriate.

The Commission orders:

(A) Surrender of the license for Project No. 174 is hereby accepted, effective as of December 31, 1964.

(B) Subparagraph (iii) of Article 44 of the license for Project No. 2290 is hereby amended to read as follows:

> (iii) For the purpose of recompensing the United States for the use, occupancy and enjoyment of its lands for transmission line right-of-way purposes only, $77.12, effective January 1, 1965.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this order. In acknowledgement of the acceptance of this order, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

PACIFIC POWER & LIGHT COMPANY, PROJECT NO. 2082

ORDER APPROVING REVISED EXHIBIT L DRAWINGS

(Issued July 14, 1965)

Pacific Power & Light Company, licensee for the Klamath Basin Project No. 2082, located on the Klamath River in California and Oregon, filed on May 24, 1965, revised Exhibit L drawings for the dam and spillway sections of the Iron Gate development.

In December 1964, a flood estimated by licensee to be about 20,000 cfs and exceeding a previous flood level record of approximately 11,000 cfs eroded the lower end of the spillway channel at the Iron Gate development on the Klamath River. To prevent further erosion, repairs to this facility required the design and installation of a terminal structure to dissipate the energy of a peak flood flow. The spillway capacity at Iron Gate was designed to pass some 32,000 cfs. After experiencing the flood of December 1964, the licensee now proposes to raise the

dam itself some 5 feet to increase this capacity to 65,000 cfs, leaving a freeboard of 2.8 feet. The addition of five feet to the height of the dam is to prevent overtopping of the structures during maximum peak flood flows, and will not change the operating level of the pool.

The design of the spillway channel and stilling basin is considered adequate, and the spillway capacity is satisfactory.

The revised drawings reflect these necessary changes and seek to supplement, not supersede the Exhibit L drawings now part of the license.

The Office of the Chief of Engineers, U.S. Army has reported that the plans of the structures affecting navigation shown on the revised Exhibit L drawings are satisfactory.

The following described Exhibit L drawings conform to the Commission's rules and regulations and should be approved as part of the license for the project:

Iron Gate Development

Exhibit L, Sheet No.	FPC No.	Title	Supplementing FPC No.
L-10A	2082-174	Dam Crest Modifications	2082-142
L-15A	2082-175	Spillway Modifications	2082-151

The Commission orders:

The above-described revised Exhibit L drawings are hereby approved as part of the license for Project No. 2082.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

PUBLIC UTILITY DISTRICT NO. 1 OF CHELAN COUNTY, WASHINGTON, PROJECT NOS. 2324 AND 2369

ORDER PERMITTING WITHDRAWAL OF APPLICATIONS FOR LICENSE

(Issued July 14, 1965)

Public Utility District No. 1 of Chelan County, Washington (District) was issued a preliminary permit for a period of three years effective July 1, 1954, for proposed Project No. 2151, which was to consist of hydroelectric developments on the Wenatchee River and its tributaries in the State of Washington.

The District filed applications for license for Project Nos. 2151, 2324 and 2369 on June 27, 1957, October 9, 1962, and May 17, 1963, respectively, all of which propose developments within the Wenatchee River basin covered by the preliminary permit.

By the letter of February 16, 1965, the District requested permission to withdraw its applications for Project Nos. 2324 and 2369, and to amend the application for Project No. 2151 so as to include under that one application all the developments, with revisions, which are presently covered by the three applications for license.

By letter of March 16, 1965, the District was advised that its request for permission to withdraw the applications for license for Project Nos. 2324 and 2369 would be considered as a notice of withdrawal and request for permission pursuant to Section 1.11(d) of the Commission's Rules of Practice and Procedure.

An amendment to the application for license for Project No. 2151 was filed by the District on May 10, 1965, to include in the application as amended the following proposed developments on the Wenatchee River and its tributaries:

1. A relocated Chiwaukum Dam and Leavenworth Powerhouse.
2. A reconstruction of Dryden Dam and Powerhouse.
3. Beaver Creek Dam and Powerhouse.
4. Chiwawa Dam and Dirtyface Mountain Powerhouse.

The Commission finds:

It is not inconsistent with the public interest that the applications for license for proposed Project Nos. 2324 and 2369 be withdrawn.

The Commission orders:

Public Utility District No. 1. of Chelan County, Washington is hereby permitted to withdraw applications for license for Project Nos. 2324 and 2369, and the proceedings on those applications are terminated.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

C. W. ALEXANDER, ET AL. AND GULF OIL CORPORATION, DOCKET NOS. G–6932, G–10565 AND G–19931

ORDER AMENDING ORDER ISSUING CERTIFICATE, APPROVING RATE SETTLEMENT PROPOSAL, TERMINATING PROCEEDINGS AND APPROVING SUCCESSION FILINGS

(Issued July 15, 1965)

These proceedings involve the succession by Gulf Oil Corporation (Gulf) to certain acreage from C. W. Alexander, *et al.* (Alexander) in the Pistol Ridge Field, Pearl River County, Mississippi, and two increased rate filings made by Alexander prior to Gulf's succession. A sale of natural gas was made from such acreage under Gulf's FPC Gas Rate Schedule No. 77 at a rate of 24.0¢ per Mcf of natural gas, and Alexander's FPC Gas Rate Schedule No. 1 at a rate of 20.0¢ per Mcf, to United Gas Pipe Line Company prior to November 18, 1960, the date of assignment of the acreage to Gulf. Inadvertently, following the assignment United was billed by Gulf and paid for all gas delivered under both Gulf's and Alexander's interests at the rate of 24.0¢ per Mcf.

On April 25, 1963, we approved by order issued in *Gulf Oil Corporation, et al.*, Docket No. G–9520, *et al.* (29 FPC 837) a company-wide settlement proposal filed by Gulf, whereby a settlement rate of 20.0¢ was fixed for the subject sale, and Gulf made appropriate refunds of monies collected subject to refund thereunder. Subsequently, Gulf determined that it had been charging and collecting its effective rate of 24.0¢ per Mcf of gas for Alexander's interest, instead of Alexander's effective rate of 20.0¢ per Mcf, and it made appropriate reimbursement to United.

On March 31, 1965, Gulf submitted succession filings in Docket No. G–6932, wherein Alexander had been granted a certificate of public convenience and necessity, and an offer of settlement in Docket Nos. G–10565 and G–19931 pursuant to Section 1.18(e) of the Commission's Rules of Practice and Procedure. In Docket No. G–10565 there is involved a proposed increased rate of 20.0¢ per Mcf filed by Alexander which was suspended by order of the Commission for the statutory period and made effective subject to refund. Docket No. G–19931

involves a proposed increased rate of 24.0¢ which was suspended by order of the Commission for the statutory period, but never placed in effect subject to refund. Gulf proposes a settlement rate of 20.0¢ per Mcf of gas for the sale from the acquired acreage. On June 14, 1965, Alexander filed a letter concurring in Gulf's proposal.

The circumstances surrounding this sale are identical to those which we considered in our order of April 25, 1963 (*supra*) and which led us to find that the proposed settlement rate of 20.0¢ per Mcf for other sales by Gulf in the same field to United was to be regarded as an initial rate. Consequently, we find the settlement rate here of 20.0¢ per Mcf to be proper and approve the same.

As to Gulf's succession filings, after due notice no petitions to intervene, notices of intervention or protest to the granting of the application have been filed.

We desire to make it clear that acceptance of Gulf's offer of settlement, as concurred in by Alexander, shall not be construed as approval of any future increased rate under the subject rate schedule, and is without prejudice to any findings or order of the Commission in any future proceedings, including area rate or other similar proceedings, involving Gulf's rates and rate schedules.

The Commission finds:

(1) The proposed settlement of the proceedings in Docket Nos. G–10565 and G–19931, on the basis described herein, as more fully set forth in the offer of settlement filed with the Commission by Gulf on March 31, 1965, and concurred in by Alexander on June 14, 1965, is consistent with the public interest and approval thereof is appropriate to carry out the provisions of the Natural Gas Act.

(2) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act, and the public convenience and necessity require that the order issuing a certificate in Docket No. G–6932 to C. W. Alexander, *et al.*, should be amended by substituting Gulf Oil Corporation as the certificate holder.

The Commission orders:

(A) The offer of settlement filed with the Commission by Gulf on March 31, 1965, and concurred in by Alexander on June 14, 1965, is approved in accordance with the provisions of this order.

(B) The order issued March 8, 1957, granting a certificate of public convenience and necessity to C. W. Alexander, *et al.*, is amended to substitute Gulf Oil Corporation as certificate holder, and in all other respects said order shall remain in full force and effect.

(C) C. W. Alexander's FPC Gas Rate Schedule No. 1 is redesignated as Gulf Oil Corporation's FPC Gas Rate Schedule No. 294.

(D) Docket Nos. G–10565 and G–19931 are terminated, and Alexander and Gulf are relieved of any refund obligation thereunder.

(E) The acceptance by the Commission of Gulf's offer of settlement, concurred in by Alexander, is without prejudice to any findings or determinations that may be made in any proceeding now pending, or hereafter instituted by or against Gulf, and is without prejudice to claims or contentions which may be made by Gulf, the Commission staff, or any affected party hereto in any proceeding, including area rate or similar proceedings.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CHARLES F. DEBARDELEBEN, JR. (OPERATOR), ET AL., DOCKET NO. RI65–222; BARNWELL PRODUCTION COMPANY, RI65–223 AND RI65–229; BARNWELL PRODUCTION COMPANY (AGENT FOR J. PAUL RATLIFF, JR.), RI65–230

ORDER ACCEPTING OFFERS OF SETTLEMENT, PERMITTING WITHDRAWAL OF NOTICES OF CHANGE, REQUIRING FILING OF CHANGES, CONTRACT AMENDMENTS AND TERMINATING PROCEEDINGS

(Issued July 15, 1965)

On May 24, 1965, the above-named Respondents each filed an offer of settlement in its respective above-docketed proceedings pursuant to Section 1.18(e) of the Commission's Rules of Practice and Procedure. The offers involve sales of natural gas to Tennessee Gas Transmission Company (TGT) from acreage located in Texas Railroad Commission District No. 6. Respondents propose to execute contract amendments with TGT which will eliminate all price escalation provisions, except those providing for future tax reimbursement, and provide for a single total rate of 15.0¢ per Mcf of natural gas for the remaining terms of the respective contracts, each of which extend to November 1, 1979.

On September 4, 1964, Respondents each filed proposed rate increases which were suspended for the statutory period by orders of the Commission in the above-entitled proceedings. Respondents have not filed appropriate motions under the Natural Gas Act to make the proposed increased rates effective. Therefore, we shall permit Respondents to withdraw their respective proposed increases, and shall terminate the proceedings thereon.

The proposed settlements are consistent with the provisions of the Second and Ninth Amendments to the Commission's Statement of General Policy No. 61–1, 18 CFR 2.56, and their acceptance would serve the public interest.

However, we desire to make it clear that acceptance of Respondents' offers of settlement shall not be construed as approval of any future increased rate filed in accordance with their reservation of the right to file increases to cover future tax increases as provided for in the offers of settlement, and is without prejudice to any findings or orders of the Commission in any future proceedings, including area or other similar proceedings, involving Respondents' respective rates and rate schedules.

The Commission finds:

The proposed settlement of the above-designated proceedings, on the basis described herein, as more fully set forth in the offers of settlement filed with the Commission by Respondents on May 24, 1965, is in the public interest, and approval thereof is appropriate to carry out the provisions of the Natural Gas Act.

The Commission orders:

(A) The offers of settlement filed by each of the Respondents on May 24, 1965, are approved in accordance with the provisions of this order.

(B) The notices of change in the rate filed by each of the Respondents on September 4, 1964, under their respective FPC Gas Rate Schedules involved herein which were suspended in the above-entitled proceedings, are hereby deemed to be withdrawn.

(C) The proposed settlement rate of 15.0¢ per Mcf of natural gas at 14.65 psia, under each of the proposals approved hereby, shall be effective as of the

date of this order, provided that Respondents shall each file with the Commission within thirty days from such date an executed contract amendment with TGT in compliance with the terms of its proposal, and a notice of change in rate providing for the settlement rate.

(D) Upon notification by the Secretary of the Commission that each of the Respondents has complied with the terms and conditions of this order, each of the above-designated proceedings shall terminate without further order of the Commission.

(E) The acceptance by the Commission of Respondents' offers of settlement is without prejudice to any findings or determinations that may be made in any proceeding now pending, hereafter instituted by or against each of them, and is without prejudice to claims or contentions which may be made by each of them, the Commission staff, or any affected party hereto, in any proceeding, including area rate or similar proceeding.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

KANSAS–NEBRASKA NATURAL GAS COMPANY, INC., DOCKET NO. CP65–289; KANSAS–NEBRASKA NATURAL GAS COMPANY, INC., DOCKET NO. CP63–340

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY, PERMITTING AND APPROVING ABANDONMENT, AND AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 19, 1965)

On March 16, 1965, Kansas-Nebraska Natural Gas Company, Inc. (Applicant), Phillipsburg, Kansas, filed in Docket No. CP65–289 an application pursuant to Sections 7(b) and 7(c) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities and for a certificate of public convenience and necessity authorizing Applicant to construct and operate certain natural gas facilities, to increase the volume of storage gas in its Huntsman, Nebraska underground reservoir, and to change the operation of certain existing facilities, all as more fully set forth in the application.

Specifically, Applicant seeks (1) certificate authorization to: (a) construct and operate approximately 24 miles of 12-inch pipeline between Northport and Sidney, Nebraska (Huntsman Plant north of Sidney), replacing an equal length of 8-inch pipeline between the same points; (b) increase the maximum volume of storage gas which may be maintained in the Huntsman, Nebraska storage facility to 6,000,000 Mcf in lieu of operation of said field at maximum pressure of 568 psia at the wellhead (shut-in), as authorized by Commission order issued July 19, 1963 in Docket No. CP63–340, 30 FPC 356. (c) operate certain existing facilities, consisting of 14.4 miles of 4-inch pipeline used to provide natural gas service to Kimball, Nebraska, for the transportation of natural gas in interstate rather than in intrastate commerce; and (2) permission and approval to abandon four compressor units totaling 345 horsepower, two of which are located at Applicant's Scottsbluff, Nebraska Compressor Station and the other two of which are located at Applicant's Northport, Nebraska station.

Total estimated cost of Applicant's proposed construction is $570,000 not including salvage credits, and will be financed with current working capital.

On April 2, 1965, Colorado Interstate Gas Company (Colorado) filed a petition to intervene in this proceeding, and subsequent thereto on June 16, 1965, filed a notice of withdrawal thereof. It appears the request of Colorado to withdraw its petition to intervene should be granted.

After due notice, no petition to intervene other than the one withdrawn by Colorado, notice of intervention or protest to the granting of the application, has been filed.

At a hearing held on July 16, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application, submitted in support of the authorizations sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Kansas-Nebraska Natural Gas Company, Inc., a Kansas corporation having its principal place of business in Phillipsburg, Kansas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of April 6, 1943, in Docket No. G–259 (3 FPC 966).

(2) The facilities proposed to be abandoned by Applicant as hereinbefore described and as more fully described in the application filed in Docket No. CP65–289 are used in the transportation and sale of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and such abandonment is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The proposed abandonment of the aforesaid facilities by Applicant is permitted by the public convenience and necessity and permission and approval therefor should be granted as hereinafter ordered.

(4) The proposed construction and operation of facilities, and the transportation of natural gas in interstate commerce by applicant as hereinbefore described and as more fully described in the application are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(5) The aforesaid proposed construction and operation of facilities, and the transportation of natural gas in interstate commerce are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(6) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act, and the requirements, rules and regulations of the Commission thereunder.

(7) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

(8) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the request of Colorado Interstate Gas Company to withdraw its petition to intervene filed in the proceeding on April 2, 1965, be granted.

(9) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the Commission's order in Docket No. CP63–340, issued July 19, 1963, be amended as hereinafter ordered.

The Commission orders:

(A) Permission for and approval of the abandonment by Applicant of the facilities hereinbefore described, as more fully described in the application are hereby granted.

(B) A certificate of public convenience and necessity is issued to Kansas-Nebraska Natural Gas Company, Inc., authorizing the construction and operation of facilities and the transportation of natural gas as hereinbefore described, all as more fully described in the application.

(C) The certificate issued by paragraph (B) above and the rights granted thereunder are hereby conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

(D) Applicant shall advise the Commission of the date of abandonment of the facilities as authorized in paragraph (A) above within ten days of such abandonment.

(E) The facilities hereby authorized shall be completed and placed in actual operation, and the transportation of gas authorized in paragraph (B) above shall commence, as provided in paragraph (b) of Section 157.20 of the aforesaid Regulations within 12 months of the date on which this order issues.

(F) The request of Colorado Interstate Gas Company filed on June 16, 1965, to withdraw its petition to intervene filed in this proceeding on April 2, 1965, is hereby granted.

(G) The Commission's order issued July 19, 1963 in Docket No. CP63-340, be amended by authorizing the Applicant to increase the maximum volume of storage gas which may be maintained in the Huntsman, Nebraska storage facility to 6,000,000 Mcf in lieu of operation of said field at a maximum pressure of 568 psia at the wellhead (shut-in).

(H) In all other respects the order issued in Docket No. CP63-340, shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. RP65-50

ORDER DENYING PETITION FOR EXTENSION OF TIME

(Issued July 19, 1965)

Natural Gas Pipeline Company of America (Natural) on July 12, 1965, filed a petition for an extension of time within which it is required to submit a Cost and Revenue Report. Natural, in its petition, requests that this requirement be suspended pending court review of our order, or in the alternative, during the course of negotiations with our staff looking toward a settlement of the issues raised by this rate proceeding and investigation.

The Commission, by order issued April 2, 1965,[1] instituted an investigation of Natural's rates and required that the company submit by April 30, 1965, a Cost and Revenue Report which we found necessary and appropriate to assist the Commission in the proper administration of the Act by expediting this investigation. Twice Natural has petitioned for reconsideration of our order instituting the investigation and requiring this Report. After full considera-

[1] "Order Instituting Investigation and Requiring Reporting of Cost and Revenue Data," *Natural Gas Pipeline Company of America*, Docket No. RP65-50, 33 FPC 666.

tion, we found Natural's objections to be without merit and reaffirmed the necessity and propriety of such a Cost and Revenue Report.

Twice at Natural's request, the time for filing the Cost and Revenue Report has been extended. By order issued April 30, 1965,[2] the time was extended to June 1, 1965. By Notice issued June 3, 1965,[3] the time was further extended to July 15, 1965. In total, Natural has already had three and one half months for the preparation and submission of this report.

Natural does not assert in its petition that it is making a good faith effort to comply with our order and that more time is necessary to complete the task. We have not been informed that the company has done any more than undertake the preliminary preparation for the performance of its task. The company states only that pending court review and continuance of settlement negotiations proper administrative procedure requires that the filing requirement be suspended. We do not agree.

That our orders are presumptively valid requires no citation; we will not lightly annul their effectiveness. Moreover, the initiation of a review proceeding does not *ipso facto* operate as a stay of our order, and, in the more than three weeks that have elapsed since Natural's petition for review of our order of April 2 was filed in the United States Court of Appeals for the Seventh Circuit (No. 15208), no motion for stay has been filed in that court of which we have had any notice.

To our knowledge there has been no indication to Natural by our orders or by our staff[4] that the filing requirement was, or should be, suspended during such negotiations. On the contrary, the data we have called for will aid the proper and efficient conduct of such negotiations.

Absent extenuating circumstances, we do not feel that it is proper to stay the effect of our orders in the absence of assurances that petitioner is making a good faith effort to comply therewith and needs additional time to complete the required task. It appears that this situation is one in which a party has deliberately embarked on a course of non-compliance with our order, with the intention of trying to avoid the consequences of such violation by last minute requests for further extension.

The company also suggests that the negotiations now in progress may soon result in a mutually satisfactory settlement and thus moot the entire issue. However, no formal offer has been submitted as yet and the negotiations are still in an inchoate stage with an uncertain outcome. In view of these considerations we must reject the conclusion that such a settlement is imminent.

There is an additional and independent reason for denial of Natural's petition. Our Regulations provide in Section 1.13(d) that petitions for extension of time must be made "within four-fifths of the period" prescribed. The notice of June 3, 1965 extended the time for filing to July 15, 1965; the petition filed July 12, 1965 was not within four-fifths of the time prescribed and is untimely. As we have stated, neither the pendency of review nor the continuance of negotiations were reasonable grounds for failure to request a further extension before this time.

The Commission orders:

The petition filed by Natural on July 12, 1965 is hereby denied.

---

[2] "Order Denying Petition for Reconsideration and Withdrawal and/or Termination of Commission Order of April 2, 1965, and Granting Extension of Time," *Natural Gas Pipeline Company of America*, Docket No. RP65–50, 33 FPC 929.

[3] "Notice of Extension of Time," *Natural Gas Pipeline Company of America*, Docket No. RP65–50.

[4] Staff Counsel's answer to Natural's petition of April 14, 1965, at page 15, it was specifically pointed out that Staff did not view the settlement negotiations as obviating the necessity for a filing of a Cost and Revenue Report.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

NORTHERN STATES POWER COMPANY, DOCKET NO. E-7232

ORDER AUTHORIZING ISSUANCE OF COMMON STOCK

(Issued July 19, 1965)

Northern States Power Company (Applicant), incorporated under the laws of the State of Minnesota and qualified to do business in the States of North Dakota and South Dakota with its principal business office at Minneapolis, Minnesota, filed an application on June 18, 1965, with the Federal Power Commission pursuant to Section 204 of the Federal Power Act, seeking an order authorizing it to issue 772,008 additional shares of its Common Stock.

The 772,008 additional shares of Common Stock are to be issued and sold in the following manner; (1) the shares are to be offered to the Applicant's Common Stockholders at a subscription price to be set on July 26, 1965, on the basis of one new share for each twenty shares held by the stockholders; (2) new shares not subscribed for by the stockholders plus any outstanding shares acquired in market stabilization transactions are to be offered to present and retired employees of the Applicant at the subscription price; and (3) shares not subscribed for by holders of subscription warrants and shares not taken by employees will be sold at competitive bidding at the same price per share as the subscription price.

According to the application, an invitation for competitive proposals will be published in The Wall Street Journal on July 20, 1965. Each proposal, which may be made by a single bidder or by a group of bidders must be for the purchase of all the unsubscribed stock plus all outstanding stock acquired by the Applicant for the purpose of market price stabilization, at the same price per share as the subscription price. At least forty hours prior to the time for the presentation and opening of the proposals, prospective bidders will be informed of the subscription price by telegraphic notice. Proposals must be accompanied by deposits of $250,000, and be presented to the Applicant before 10:00 a.m. CDST on July 28, 1965. If the Applicant accepts any proposal, it will accept that proposal which specifies the lowest aggregate amount of compensation to be paid by the Applicant to the bidder or bidders as compensation for their commitments and obligations in connection with the unsubscribed shares plus any outstanding shares acquired for market stabilization.

According to the application, proceeds from the sale of the additional shares of Common Stock will be added to the general funds of the Applicant and will be used to retire all short-term bank loans outstanding at the time the proceeds are received and to provide funds for construction expenditures. The above mentioned bank loans, expected to aggregate $25,000,000, have been or will be incurred in connection with Applicant's 1965 construction program, expenditures for which are presently estimated at $51.6 million. This construction program was described in our order issued June 11, 1965 in the matter of *Northern States Power Company*, Docket No. E-7223, 33 FPC 1255.

Written notice of the application has been given to the North Dakota Public Service Commission and the South Dakota Public Utilities Commission and to the Governor of each of those States. Notice has also been published in the Federal Register on June 29, 1965 (30 F.R. 8289), stating that any person desiring to be heard or to make any protest with reference to the application shall file petitions or protests on or before July 12, 1965 with the Federal Power

Commission, Washington, D.C., 20426. No protest, petition or request to be heard in opposition to the granting of the application has been received. By order entered June 21, 1965, the Public Service Commission of the State of North Dakota approved this proposed transaction.

The Commission finds:

(1) Applicant, a corporation, is a public utility within the meaning of Section 204 of the Federal Power Act, subject to the jurisdiction of the Commission, as heretofore described and set forth in the Commission's order issued February 27, 1964, *Northern States Power Company*, Docket No. E–7145 (31 FPC 464).

(2) The proposed issuance and sale of Common Stock, as described above, will constitute an issuance of securities within the purview of Section 204 of the Federal Power Act.

(3) Applicant is not organized and operating in a State under the laws of which the security issue here involved is regulated by a State Commission within the meaning of Section 204(f) of the Act, and the proposed issuance of securities is, therefore, not exempt by virtue of that Section from the requirements of Section 204 of the Act.

(4) The proposed issuance and sale of Common Stock, as hereinafter authorized, will be for a lawful object, within the corporate purposes of Applicant and compatible with the public interest, which is appropriate for and consistent with the proper performance by Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably appropriate for such purposes.

(5) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) The proposed issuance and sale of Common Stock, upon the terms and conditions and for the purposes specified in the application, as described above, are authorized, subject to the provisions of this order.

(B) The proposed issuance and sale of Common Stock in the manner set forth in the application shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2(g) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2(h)(1) of those Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegraph, as contemplated in Section 34.9 of the Regulations.

(ii) The Commission, by further order, shall have approved the price per share to be received by Applicant for the Common Stock and the amount of any compensation for underwriters to be paid by Applicant in connection with the Common Stock.

(C) This authorization shall expire unless the transactions hereby authorized are consummated within 90 days from the date of issuance of this order.

(D) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuation, estimates or determinations of cost, or any other matter whatsoever now pending or which may come before this Commission.

(E) Nothing in this order shall be construed to imply any guarantee or obligation on the part of the United States with respect to any securities to which this order relates.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and David S. Black.

ANNUAL REPORT FORM NO. 2—NATURAL GAS COMPANIES—TAKE OR PAY GAS PURCHASE PREPAYMENTS AND DELIVERY OBLIGATIONS SCHEDULES, DOCKET NO. R-253

ORDER NO. 301

AMENDING ANNUAL REPORT FORM F.P.C. NO. 2

(Issued July 19, 1965)*

On December 24, 1963, the Commission issued a notice of proposed rulemaking in this proceeding (29 F.R. 21, January 1, 1964) wherein it proposed the addition of two new schedules, supplementing the information supplied in existing schedules, to the annual report, F.P.C. Form No. 2, required by § 260.1 of Regulations Under the Natural Gas Act. The information to be supplied is required to enable the Commission to make thorough analyses of the prepayments made by pipeline companies and their customers under take-or-pay sales agreements. Existing schedules are couched in general terms and do not provide a specific form for entering detailed information on prepaid gas purchases or sales. On the other hand, the detailed information to be required hereafter will enable the Commission to evaluate annually the growth or decline in the effect of the use of prepayment sales agreements and the dollars involved. Since prepayments received by the pipeline companies under field sales and other agreements have an offsetting effect on the prepayments paid out by such pipeline companies, it is necessary for the Commission, as well as other interested persons, to have the detail of such offsetting amounts in order to evaluate the net effect of prepayments on the pipeline companies—the basic purpose of the proceeding.

The notice of proposed rulemaking elicited responses from six pipeline companies, one distributor and two state commissions. The opposition was directed principally against instruction paragraphs Nos. 2 and 5 in both schedules.

Instruction No. 2 would require the companies to submit the dates of the latest gas reserve determinations, on which take-or-pay volumes are frequently based, together with related explanations. The respondents contend that unless this information is kept confidential their future negotiations with producers would be hampered and subsequent reserve determinations prejudiced. Further, they point out that this same matter is involved in the second phase of the proceeding in Docket No. R-239, wherein the Commission prescribed the annual report of gas supply, F.P.C. Form No. 15 (See Order No. 279, issued March 31, 1964, 31 FPC 750, 29 F.R. 4873). We agree that it would be more appropriate to consider this matter in the context of a different proceeding and accordingly have removed instruction paragraph 2, proposed in the notice, from both forms.

The objections to the 5th instruction in each form are of a similar nature. The instruction, as proposed, would require the companies to list the suppliers or customers with whom there is a controversy over take-or-pay provisions and to detail the nature of the controversy. The pipeline objectors state that to give a "concise explanation" of the controversy would be impossible and the explanation might jeopardize their positions in any litigation which might result from the controversy. The objection is well taken and we are revising instruction 5 in each schedule to eliminate the necessity for any explanation other than that which the company chooses to make; if further clarification is required we can communicate with the company directly.

*Published in the Federal Register on July 24, 1965 (30 F.R. 9263).

We are also adopting suggested changes in the wording of the titles of the schedules in the interest of clarity. Certain additions to the proposed schedules suggested by a distributing company which would add a reporting burden not warranted or contemplated by the notice have not been adopted.

The Commission finds:

(1) The amendments to the regulations and to the annual report F.P.C. Form No. 2 are necessary and appropriate for the administration of the Natural Gas Act.

(2) The revisions made in the form of the schedules originally proposed were prompted by various suggestions made in the comments received and since they do not amount to a significant departure from those proposed further notice thereof prior to adoption is unnecessary.

The Commission, acting pursuant to the provisions of the Natural Gas Act, particularly sections 10 and 16 thereof (52 Stat. 826, 830; 15 U.S.C. 717i, 717o), *orders:*

(A) Section 260.1, Subchapter G, Chapter I, Title 18 of the Code of Federal Regulations, and F.P.C. Form No. 2, prescribed thereby, are amended as follows:

1. Paragraph (c) of § 260.1 is amended by inserting in the list of schedules set out in that paragraph, to follow the line "Prepayments," the words "Prepaid gas purchases under purchase agreements,"

2. The said paragraph (c) is also amended by inserting, to follow the line "Other deferred credits," the words "Undelivered gas obligations under sales agreements."

3. Annual Report F.P.C. Form No. 2, prescribed by § 260.1(a) is amended by revising the instruction paragraph 2 in the schedule "Prepayments (Account 165)" to read as follows:

> 2. For any prepaid gas purchases under take-or-pay clauses of gas purchase agreements show the total amount and report particulars thereof as called for by the schedule. Prepaid Gas Purchases Under Purchase Agreements, page 210A. Show also in this schedule, but as a separate item, any prepaid gas purchases classified in Account 165, Prepayments, but not related to take-or-pay arrangements.

4. The said Annual Report F.P.C. Form No. 2 is further amended by adding the following new instruction paragraph 4. to the schedule "Other Deferred Credits (Account 253)" on page 225:

> 4. For any undelivered gas obligations to customers under take-or-pay clauses of sale agreements, show the total amount and report particulars thereof as called for by the schedule, Undelivered Gas Obligations Under Sales Agreements, page 225A. Show also in this schedule, but as a separate item, any advance billings or receipts for gas sales or service classified in Account 253 but not related to take-or-pay arrangements.

5. The said Annual Report F.P.C. Form No. 2 is further amended by adding two new schedules entitled "Prepaid Gas Purchases Under Purchase Agreements" (page 210A) and "Undelivered Gas Obligations Under Sales Agreements" (page 225A), as set out, respectively, in Appendix A* and Appendix B* hereto.

* * * * * * * * *

[Secs. 10, 16, 52 Stat. 826, 830; 15 U.S.C. 717i, 717o.]

*Omitted in printing.

(B) The amendments to § 260.1 shall be effective *August 24, 1965;* those to the Annual Report F.P.C. Form No. 2 shall be effective for the reporting year 1965 and thereafter.

(C) The Secretary shall cause prompt publication of this order to be made in the Federal Register.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

ARIZONA PUBLIC SERVICE COMPANY, DOCKET NO. E-7226

ORDER AUTHORIZING SALE OF FACILITIES

(Issued July 20, 1965)

Arizona Public Service Company (Public Service) filed an application on May 25, 1965, for an order, pursuant to Section 203 of the Federal Power Act, authorizing the sale to Salt River Project Agricultural Improvement and Power District (Salt River) of certain transmission facilities located in and near Public Service's switchyard of its Ocotillo Steam Generation Power Plant in the City of Tempe, Arizona.

Public Service was incorporated under the name of Central Arizona Light and Power Company under the laws of the State of Arizona on February 16, 1920 and is qualified to do business in Arizona and New Mexico. It is engaged principally in the generation, transmission, sale at wholesale, and distribution of electric energy in a service area encompassing approximately 40,000 square miles in 10 of Arizona's 14 counties. Public Service's facilities are operated as eight distinct systems which are in many cases physically separated from each other but connected electrically through the facilities of other systems. Public Service owns and operates the Four Corners steam-electric generating station in New Mexico and transmission facilities connecting that station with its system in Arizona. During 1964, electric energy was transmitted from Four Corners station to Public Service's Arizona system. Public Service also receives power from United States Bureau of Reclamation's Parker-Davis system, some of which is generated in California and Nevada.

Salt River was organized in 1937 pursuant to provisions of the Agricultural Improvement District Act of Arizona and is a political subdivision of the State of Arizona. Salt River is engaged principally in the electric utility business rendering electric service in parts of Maricopa, Gila, and Pinal Counties in Arizona. It also operates the Salt River project, a Federal Reclamation Project.

The facilities to be sold by Applicant are transmission facilities located in and near its switchyard of the so-called Ocotillo Steam Generation Power Plant in the City of Tempe, Arizona. Applicant proposes to sell facilities comprising of Bay No. 9 consisting of oil circuit breaker, related protective apparatus and 69 kv tie line between its switchyard and that of Salt River. According to the application, facilities to be transferred will be used for the rendition of power transmission by Salt River.

The facilities are to be sold for a cash consideration of $99,398. This amount is the same as the original cost of the facilities, that is, the original cost as recorded, before deduction of accumulated provision for depreciation.

Public Service will realize a gross profit of $15,614 (consideration of $99,398 — net plant of $83,784) on the sale. This profit, however, will mean the payment of additional taxes estimated at $8,469 by Public Service. On its books, Public Service proposes to record the liability for additional taxes by a credit of $8,469 to Taxes Accrued, and the net amount of the profit, $7,145, will be credited to Earned Surplus.

Written notice of the application has been given to the Arizona Corporation Commission and to the Governor of that State. Notice was also published in the Federal Register on June 8, 1965 (30 F.R. 7506), stating that any person desiring to be heard or to make any protest with reference to said application should on or before June 23, 1965, file with the Federal Power Commission, Washington, D.C., 20426, petitions or protests in accordance with the requirements of the Commission's Rules of Practice and Procedure (18 CFR 1.8 or 1.10). No protest or petition or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Public Service, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act subject to the jurisdiction of the Commission as heretofore described and set forth in the Commission's order issued July 6, 1961, in *Arizona Public Service Company*, Docket No. E–6981 (26 FPC 36).

(2) By the proposed sale of facilities, Public Service will dispose of part of its facilities subject to the jurisdiction of the Commission within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(3) The proposed sale of facilities of Public Service, as described above, upon the terms and conditions set forth in the application, and subject to the provisions of this order will be consistent with the public interest as expressed in Section 203 of the Federal Power Act.

The Commission orders:

(A) The proposed sale by Public Service of the aforementioned electric facilities, all as described above, is authorized and approved upon the terms and conditions and for the purposes set forth in the application subject to the provisions of this order.

(B) Public Service shall record the proposed transaction herein authorized and the facilities and properties referred to above as provided in the Commission's Uniform System of Accounts Prescribed for Public Utilities and Licensees.

(C) This authorization shall expire unless the transaction herein authorized and approved is consummated within 90 days from the date of issuance of this order.

(D) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuations, estimates or determinations of cost, or any matter whatsoever now pending or which may come before this Commission or any other regulatory body and nothing herein shall be construed as an acquiescence by this Commission in any estimate or determination of cost or any valuation of property claimed or asserted.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

THE DETROIT EDISON COMPANY AND CONSUMERS POWER COMPANY, DOCKET NO. E-7206; THE DETROIT EDISON COMPANY, DOCKET NO. E-7207

ORDER ON REQUESTS FOR PERMISSION TO WITHDRAW APPLICATIONS

(Issued July 20, 1965)

These proceedings arise out of a joint application filed by The Detroit Edison Company (Detroit) and Consumers Power Company (Consumers) on November 13, 1964 for authority under Section 202(e) of the Federal Power Act to export electric energy to Canada at a maximum rate of 750,000 kva, and an application by Detroit of the same date for a Presidential Permit pursuant to Executive Order No. 10485 to authorize the construction of additional facilities at the international boundary so as to provide an interconnection between Detroit's St. Clair Generating Station and the proposed Lambton Generating Station of The Hydro-Electric Power Commission of Ontario (Hydro) to be located near Courtright, Ontario. For the reasons discussed below Detroit and Consumers on May 17, 1965, have filed a "Notice of Withdrawal" of their applications, and this, after certification by the examiner, is now before us for disposition.

In 1953 Detroit was originally granted a Presidential Permit to maintain two interconnections with Hydro across the international boundary—one across the Detroit River at Windsor and one across the St. Clair River at Sarnia, Ontario. At the same time we granted permission to export electric energy over these interconnections.[1] The maximum amount to be exported was increased until by order of April 6, 1964, it became 1,000,000,000 kwh annually at 600,000 kva.[2]

The present applications would increase the maximum amount of energy to be transmitted by 150,000 kva up to 750,000 kva and provide for a third interconnection with Hydro across the St. Clair River. It would deliver energy at 230 kv but is designed for eventual operation at 345 kv.

The present export application includes an interconnection agreement between Consumers, Detroit and Hydro dated January 20, 1965. A "Supplement C" to the agreement states:

> It is the intent of the parties to this interconnection agreement to assure continuation of the operation of their systems within the scope of Section 202(f), of the Federal Power Act which provides that, "The ownership or operation of facilities for the transmission or sale at wholesale of electric energy which is (a) generated within a State and transmitted from that State across an international boundary and not thereafter transmitted into any other State, or (b) generated in a foreign country and transmitted across an international boundary into a State and not thereafter transmitted into any other State, shall not make a person a public utility subject to regulation as such under other provisions of this part." Therefore, as in the past, any energy which Michigan may export to Hydro is to be used only within Canada, and any energy which Michigan may import from Hydro is to be generated wholly within Canada.

[1] 12 FPC 1359.
[2] 16 FPC 1348; 31 FPC 781.

Specific provisions are included, which appear to prevent a flow of energy from New York through Canada to Michigan or from Michigan through Canada to New York.

By order of November 12, 1964, the Michigan Public Service Commission approved the proposed interconnection as benefiting the three parties and their respective service areas. The Canadian National Energy Board has approved Hydro's participation in the proposed transaction, but has voiced its opposition to the restrictive provisions of Supplement C, which it termed "repugnant."

Section 202(e) provides for our issuing an order authorizing the export of electric energy unless it would "impair the sufficiency of electric supply within the United States or would impede or tend to impede the coordination in the public interest of facilities subject to the jurisdiction of the Commission." Because we thought the Supplement C provisions raised questions under Section 202(e), in our order issued February 4, 1965, 33 FPC 177, we provided for a hearing.

Our staff made a field investigation of the applicants' facilities and energy transactions. Hearing sessions in the nature of prehearing conferences were held before Presiding Examiner William C. Levy on March 15, April 5 and May 5, 1965, and a schedule was prescribed for the presentation of evidence and the commencement of cross-examination.

On April 23, 1965, the staff filed a motion with the Commission for a subpoena duces tecum requesting the applicants to produce certain log sheets showing typical energy transactions between the two applicants and also between applicants and Hydro. The staff recited that the applicants had refused to produce these data, and that they were necessary to enable the staff to determine whether the Supplement C restrictions would impede or tend to impede the coordination of the Michigan companies and whether conditions should be attached to the grant of the Presidential Permit. The applicants answered that the data sought was irrelevant and that the staff was in reality attempting to inject into these proceedings the question of the Commission's jurisdiction over the applicants. Upon reference by the Commission the examiner issued subpoenas directed to Detroit and Consumers, and his action was affirmed by Commission order of May 13, 1965.

No useful purpose would be served in determining whether, in light of this order, we should reconsider our May 13, 1965 decision affirming the Presiding Examiner's order that a subpoena be issued, since the material covered by that subpoena must in any case be furnished for the purposes of the separate jurisdictional proceeding. We accordingly leave that subpoena order standing. Suffice it to say here that it will be up to the Examiner to decide whether any of the material covered by that subpoena is properly admissible in this proceeding.

In their "Notice of Withdrawal" the applicants again protest the jurisdictional issue being in these proceedings and point out that this issue would greatly complicate and protract the proceedings so as to render the applications moot. They contend that various discussions and conferences which have been held with the Commission staff and before the examiner have proved fruitless, and that they must proceed with the construction of alternative facilities. Therefore, they say, the applications will not be supported by testimony, or other evidence, and they state they are withdrawing their applications.

We cannot require the applicants to prosecute the applications or construct the proposed additional interconnection with Hydro if they do not choose to do so. However, on the basis of the applications it appears that the contemplated interchange of electric energy between the applicants and Hydro, in order to meet emergencies on the systems on either side of the Canadian

boundary, may be very desirable in the public interest. Therefore we are setting forth a procedure below which will divorce, to the extent possible, the time consuming and complicating jurisdictional questions from the present proceeding and enable the applicants to go forward with their applications promptly. To this end we shall deny their request to withdraw their applications in conformity with our Rules as discussed below.

By an order issued this day, *infra*, p. 83, we are initiating a separate proceeding to determine the jurisdictional status of the Michigan companies under the Federal Power Act. In that order we direct Detroit and Consumers to make their records available at the request of the staff. At the same time we are remanding the present proceedings to the examiner so that they may go forward to a determination of the propriety of the Supplement C restrictions including their impact on the coordination of the New York and Michigan facilities, but with no determination of the jurisdictional status of the Michigan facilities. We wish to emphasize that we are not now rendering any judgment as to the impact, if any, of Supplement C because any such determination can only be rendered after hearing in which the relevant evidence is presented. However, in view of Section 202(a) of the Act providing that it shall be our duty to promote and encourage interconnection and coordination and the limitation of Section 202(e) with respect to transmission of electric energy to a foreign country which would impede coordination, we cannot approve the instant application unless we are sure that it meets the statutory standards.

In remanding this case to the examiner in accordance with the procedure above with instructions to refrain from receiving any evidence that relates solely to the jurisdictional status of the applicants and to refrain from making any findings as to our jurisdiction over the facilities of the applicants or their public utility status, we should have met in large degree the objections of the applicants and have provided them with the necessary assurances that they may proceed with the prosecution of their applications.

Our authority to deny the withdrawal of the applications is found in Section 1.11(d)(1) of our Rules of Practice and Procedure, which provides that a participant desiring to withdraw a pleading may file a notice of withdrawal which shall effect the withdrawal 30 days after the filing unless otherwise ordered by the Commission for good cause. However, the section provides that this paragraph "shall not be construed as effecting, without express permission of the Commission withdrawal of: (1) any pleading in any proceeding in which a hearing has been held or convened; * * *." In our opinion our order of February 4, 1965, "convened" a hearing by prescribing that a public hearing be held on March 15, 1965. While this session and the following sessions on April 5, and May 5, 1965 turned out to be in the nature of prehearing conferences, the examiner called for cross-examination to begin on June 1, 1965. Although this session necessarily had to be postponed since the notice of withdrawal was pending before the Commission, a hearing had been "convened" not only by the Commission but by the examiner.

The basis of this rule is that once the hearing has been convened one who has invoked the Commission's processes should not be allowed to terminate them at will, particularly where he remains free to reapply at a more propitious time. In the present proceeding the staff's case is virtually completed, and it is possible to dispose of these applications without making a jurisdictional determination. Thus we might eventually find that the Supplement C restrictions do not prevent our granting the applications, or if conditions must be inserted in our order, they may not be of a nature that will cause the applicants to abandon an interconnection proposal which could be of benefit to the public both in the United States and Canada.

The Commission orders:

(A) The request of Detroit and Consumers to withdraw their applications in Docket Nos. E–7206 and E–7207 is denied.

(B) These proceedings are hereby remanded to the Presiding Examiner for further proceedings in accordance with this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

THE DETROIT EDISON COMPANY AND CONSUMERS POWER COMPANY, DOCKET NO. E–7234

ORDER INITIATING INVESTIGATION AND HEARING

(Issued July 20, 1965)

By this order we initiate an investigation of The Detroit Edison Company (Detroit) and the Consumers Power Company (Consumers) to determine whether each of those companies is a "public utility" within the meaning of and subject to the regulation under the Federal Power Act.

Detroit is a corporation engaged in the generation, transmission and sale of electric energy at wholesale and at retail. It is organized under the laws of the State of New York and maintains its principal business office in Detroit, Michigan. Consumers is a corporation also engaged in the generation, transmission and sale of electric energy at wholesale and retail. Consumers is organized under the laws of the State of Maine and maintains its principal business office in Jackson, Michigan. F.P.C. Form No. 1 filed by each company discloses that although each company makes sales at wholesale for resale, none of the rate schedules for these transactions is on file with this Commission, nor have these utilities complied with a number of other requirements of the Federal Power Act and the regulations thereunder which would be applicable to them if one or both are public utilities as defined in the Act.

From information on file with the Commission, it appears that Detroit and Consumers have attempted to fully coordinate the electric operation and planned expansion of the two systems. It further appears that each of the systems maintains a high voltage transmission network and these networks are interconnected at three points with each other and the resulting transmission network of the Michigan Pool is connected at two existing points with the transmission network of the Ontario Hydro System. (In its application for Presidential Permit presently under consideration under Docket No. E–7207, Detroit proposes to add another high voltage interconnection). It also appears that through Ontario Hydro's high voltage transmission network the Michigan Pool is connected to the high voltage transmission networks of 140 major electric systems in the United States organized in three groups commonly known as CANUSE, PJM and the Interconnected System Group, all operating in synchronism and that as a result of the operation of these interconnections, Detroit and Consumers may own or operate facilities for the interstate transmission and sale for resale of electric energy transmitted from New York and consumed in Michigan. The companies deny that they are public utilities within the meaning of the Federal Power Act and hence, that they are subject to the system of safeguards Congress provided in that Act to protect the public with respect to such matters as accounting procedures, mergers, wholesale rates and issuance of securities.

The Commission finds:

In view of the foregoing circumstances, it is necessary and appropriate for the purposes of carrying out the provisions of the Federal Power Act, and particularly, but not in limitation of the foregoing, Sections 201, 208, 301, 307, 308 and 309 (16 U.S.C. §§ 824g, 825, 825f–h) that an investigation and hearing be initiated to determine whether Detroit and Consumers are each a "public utility" within the meaning of, and subject to the requirements of the Federal Power Act.

The Commission orders:

(A) At a time and place and before a hearing examiner to be specified, a public hearing shall be held to find and determine:

(1) Whether Detroit and Consumers are each a "public utility" within the meaning of Section 201 of the Federal Power Act and required to comply with the Federal Power Act and the Commission's Regulations thereunder.

(2) Whether orders or other actions may be necessary and appropriate to bring about a compliance with the Federal Power Act and the Commission's Regulations thereunder.

(B) A prehearing conference shall be held before a presiding examiner commencing at 10 a.m., (EDST), August 10, 1965, in a hearing room of the Federal Power Commission, 441 G Street NW., Washington, D.C., 20426, for purposes as specified in the Commission's Rules of Practice and Procedure.

(C) In order that the foregoing issues may be properly determined, an investigation is hereby initiated and Detroit and Consumers are hereby directed pursuant to the provisions of Sections 201(b), 307 and 309 of the Federal Power Act to grant to authorized members of the staff of the Federal Power Commission, during regular business hours, free access to its property and the right upon their request to inspect and examine all of its accounts, records and memoranda including, but not limited to, the following: books, papers, correspondence, contracts, agreements, maps, reports of engineers, meter readings, and log sheets; and shall either furnish copies of such material at the request of the staff, or make such material available for reproduction by the staff or shall produce such material for use by the staff prior to and during said hearing at the Offices of the Commission, 441 G Street NW., Washington, D.C.

(D) Notices of intervention or petitions to intervene in this proceeding may be filed with the Federal Power Commission, 441 G Street NW., Washington, D.C., 20426, on or before August 5, 1965, in accordance with the Commission's Rules of Practice and Procedure (18 CFR 1.8 or 1.37).

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

EASTERN SHORE NATURAL GAS COMPANY, DOCKET NO. CP65-345

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 20, 1965)

On April 28, 1965, Eastern Shore Natural Gas Company (Applicant), filed in Docket No. CP65-345 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of a lateral pipeline and metering and connecting

facilities, and the delivery of natural gas on an interruptible basis to Crothers Brothers for use in the processing of grain, all as more fully set forth in the application.

Applicant proposes to tap its present 6-inch transmission line and extend a 2-inch line approximately 200 feet to Crother's plant. The application states that the estimated annual delivery of 25,000 Mcf can be made from existing gas supplies.

The total estimated cost of the lateral, meter and regulating facilities proposed by the application is $2,995.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 16, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits submitted in support of the authorization sought, and upon consideration of the record,

The Commission finds:

(1) Applicant, Eastern Shore Natural Gas Company, a Delaware corporation having its principal place of business in Salisbury, Maryland, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of November 29, 1957, in Docket No. G–12059, *et al.* (18 FPC 710).

(2) The proposed construction and operation of facilities and transportation of natural gas by Applicant as hereinbefore described, and as more fully described in the application and exhibits in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) The aforesaid construction and operation of facilities and transportation of natural gas are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is hereby issued to the Applicant in this proceeding, authorizing the construction and operation of facilities and the transportation of natural gas as more fully described in the application and exhibits in this proceeding, subject to the jurisdiction of the Commission, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are hereby conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be completed and placed in actual operation, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations within 6 months of the date on which this order issues.

(D) The certificate issued hereby is granted on the express condition that the interruptible service authorized herein shall be curtailed or interrupted to

the extent required to meet existing or future contracted maximum delivery obligations of Eastern Shore Natural Gas Company for firm service to its customers.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

NORTHERN NATURAL GAS COMPANY, CP65-1, CP65-91, CP65-338; NATURAL GAS PIPELINE COMPANY OF AMERICA, CP65-169, CP65-325; TRANSWESTERN PIPELINE COMPANY, CP65-208, C65-236, CP65-237, CP65-320

ORDER DENYING REQUEST FOR TEMPORARY CERTIFICATES AND MOTION FOR SEVERANCE

(Issued July 20, 1965)

On June 18, 1965, Northern Natural Gas Company (Northern) filed herein a request for temporary certificates authorizing it to construct and operate the facilities proposed in its applications in Docket Nos. CP65-1 and CP65-338. It also moved the Commission to sever from the above-consolidated proceeding the applications of Northern in Docket Nos. CP65-1, CP65-91 and CP65-338 and of Transwestern Pipeline Company (Transwestern) in Docket Nos. CP65-208 and CP65-236 and set said applications for a separate and immediate consolidated hearing.

Northern requests a temporary certificate to construct and operate 54 miles of 24-inch pipeline [1] at a cost of $4,408,200 to enable it to purchase and transport the initial contract volumes of gas from the Coyanosa and Gomez Fields into its Permian Basin system pipeline. As grounds for said request, Northern says that some of its contracts with producers in Coyanosa Field are already subject to cancellation by the producers due to the fact that Northern's proposed facilities in Docket No. CP65-1 were not certificated by April 1, 1965, and in the Gomez Field will be subject to cancellation in the latter part of January 1966, if no certificates have been granted to Northern by that time.

Northern alleges that the requested severance would expedite the determination of its applications.

On June 25, 1965, Natural Gas Pipeline Company of America (Natural) filed a response to Northern's request and motion, stating it did not object to Northern's request for temporary certificates, but objected to its motion for severance. Natural's objection is based upon the interdependence of Transwestern Pipeline Company's (Transwestern) competitive proposals to Northern and Natural in such common issues as facilities and rate design.

On July 12, 1965, Transwestern filed an answer opposing severance.

On June 28, 1965, The People of the State of California and the Public Utilities Commission of the State of California (California) filed an answer opposing the granting of Northern's request for temporary authorization on the ground that the possible expiration of contracts between Northern and its producers was an insufficient reason for the granting of temporary authorization and that denial of the temporary would not affect service to Northern's customers. It opposed severance on the ground that all of the applications in Phase II of this consolidated proceeding contain related issues and the requested severance would prolong the hearing to the detriment of all parties.

---

[1] Consisting of 12 miles of pipeline from Gomez Field to Northern's Coyanosa to Kermit line, proposed in Docket No. CP65-338 and 42 miles of pipeline from Coyanosa Field to Kermit, Texas, as proposed in Docket No. CP65-1.

We agree with California on both counts. The request for temporary certificates does not meet the provisions of Section 7(c) of the Natural Gas Act in that it does not show such an emergency as requires temporary authority in order "to assure maintenance of adequate service or to serve particular customers." Furthermore, the contracts for the purchase of gas in the Gomez Field will not be subject to cancellation until January 1966. Thus the sole "emergency" alleged by Northern would be the possible cancellation of the Coyanosa contracts. Were the facilities constructed which Northern herein proposes, it may be prejudicial to the other interests in this competitive proceeding. We see no reason to risk a prejudgment of the issues in this competitive proceeding when it is clear that the gas from the Coyanosa Field is not immediately necessary to meet the needs of Northern's customers. The competitive applications of Transwestern, Northern and Natural involve the case of common facilities. The issues of allocation and rate design will be present in both cases. In our order of March 16, 1965 we deemed it necessary to consolidate these competitive applications for hearing. We see no reason to change the result of that order at this time.

The Commission orders:

(A) The request of Northern Natural Gas Company for temporary certificates, filed on June 18, 1965, is denied.

(B) The motion of Northern Natural Gas Company for severance, filed on June 18, 1965, is denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

RESPONSES BY NATURAL GAS PIPELINE COMPANIES TO APPLICATIONS FOR ORDERS UNDER SECTION 7(a) OF THE NATURAL GAS ACT, DOCKET NO. R-277

ORDER NO. 302

AMENDING PART 156 OF REGULATIONS UNDER THE NATURAL GAS ACT

(Issued July 20, 1965)*

Section 7(a) of the Natural Gas Act provides that whenever the Commission, after notice and opportunity for hearing, finds such action necessary or desirable in the public interest, it may by order direct a natural gas company, under certain conditions, to establish physical connection with and sell natural gas to a person or municipality engaged in the local distribution of natural gas.

Part 156 of the Regulations Under the Natural Gas Act sets out the procedures to be followed by a distributing company or municipality in making application for such an order pursuant to Section 7(a) of the Act. Section 156.7 thereof provides that the application shall be served by the Commission's Secretary on the company, denominated as "respondent," against which a Section 7(a) order has been requested; that the respondent company shall, within 30 days, file its answer in which it shall state whether it has any objection to the grant of the application; and, if it objects, it shall state the grounds and reasons for its objection.

The effect of the failure of respondents to comply strictly with the 30-day time limitation for the filing of an answer has not been clearly understood and the uncertainty has, in some instances, resulted in unnecessarily delaying the

*Published in the Federal Register on July 27, 1965 (30 F.R. 9302).

proceedings. In order to clarify the rule for the future, we are amending § 156.7 to provide that if the respondent fails to file a timely response to the application, it shall be deemed to have agreed to the grant thereof.

The Commission finds:

(1) Since the purpose and effect of the amendment herein adopted are interpretive and procedural, the prior notice provisions of Section 4 of the Administrative Procedure Act do not apply.

(2) Adoption of this amendment is necessary and appropriate to carry out the provisions of the Natural Gas Act.

The Commission, acting pursuant to the Natural Gas Act, particularly Sections 7(a) and 16 thereof (52 Stat. 824, 830; 15 U.S.C. 717f(a), 717o), *orders:*

(A) Part 156, Subchapter E, Regulations Under the Natural Gas Act, Chapter I, Title 18 of the Code of Federal Regulations, is amended by adding a sentence at the end of § 156.7. As so amended the section will read as follows:

Part 156—Applications for Orders Under Section 7(a) of the Natural Gas Act

* * * * * * *

§ 156.7 Service of application.

After an application has been accepted for filing, the Secretary will cause a copy thereof to be served upon the natural gas company (respondent) against which an order pursuant to Section 7(a) of the Natural Gas Act has been requested. The natural gas company shall, within thirty days after the date of service of such application file its answer (an original and 7 conformed copies) to such application in which it shall state whether it has any objection to the grant of the application. If the natural gas company objects to the grant of the relief sought by the application, it shall fully state the grounds and reasons for its objections. The answer shall be verified and shall be signed by an executive of the natural gas company. In all other respects, answers shall conform to the applicable requirements of the Commission's Rules of Practice and Procedure, particularly §§ 1.9, 1.15, and 1.16 of this chapter. In the event that the respondent natural gas company fails to file a timely response to the application it shall be deemed to have agreed to the grant thereof.

* * * * * * *

[Secs. 7(a), 16; 52 Stat. 824, 830; 15 U.S.C. 717f(a), 717o]

(B) This amendment shall become effective August 2, 1965.

(C) The Secretary shall cause prompt publication of this order to be made in the Federal Register.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOUTHERN NATURAL GAS COMPANY, DOCKET NO. RP63-7 v. UNITED GAS PIPE LINE COMPANY, DOCKET NO. RP66-1

ORDER SEVERALLY DENYING APPLICATION FOR REHEARING AND PETITION FOR MODIFICATION OF OPINION NO. 460 AND INSTITUTING NEW PROCEEDING ON FORMAL COMPLAINT, DESIGNATING PRESIDING EXAMINER AND FIXING DATES FOR INTERVENTIONS, FILING OF EVIDENCE AND PREHEARING CONFERENCE

(Issued July 20, 1965)

On June 24, 1965, Southern Natural Gas Company (Southern) filed an application for rehearing of our Opinion No. 460 and order issued May 25, 1965, 33 FPC 1077, in the above-entitled proceeding. At the same time Southern also filed

a "Petition for Modification of Opinion No. 460, or, in the alternative, Formal Complaint of Southern Natural Gas Company Requesting Reduction in Maximum Daily Quantity of Gas To Be Transported and Other Relief." An answer to the petition for modification or alternative complaint was filed on June 28, 1965, by United Gas Pipe Line Company (United).

In its application for rehearing Southern contends that we erred in failing to grant it the relief which would have been granted by the Presiding Examiner in his initial decision in this proceeding and in otherwise denying to Southern, as a matter of discretion, the full extent of the relief sought in the complaint. The various allegations of error are detailed in full in the present application and need not be restated extensively here. The application primarily alleges error in our refusal to hold the provisions of United's T–3 rate schedule void rather than voidable, our failure to enforce the terms of the contract as originally written between the parties, our requirement that Southern should pay for the right to utilize 55,460 Mcf per day in United's line so long as that right existed and in our holding that Southern's agreement to United's rate settlements constitutes cause for not granting the full relief requested.

We have considered the assignments of error and grounds for rehearing set forth in the application and have reconsidered our order. The arguments advanced here were, without exception, fully considered by us in the opinion. Our conclusions thereon remain unchanged. No new facts or arguments are called to our attention by the application which would be cause for granting rehearing or disturbing the original order.

In its separate petition for modification of Opinion No. 460 Southern requests that the billing demand provided in United's Rate Schedule No. T–3, which we ordered be based on a maximum daily quantity of 35,294 Mcf per day from and after the date of our order and until changed by further order of the Commission, be reduced to 30,869 Mcf per day. In support thereof Southern contends that whereas 35,294 Mcf was the maximum daily quantity tendered at the time the complaint was submitted, the maximum daily quantity which it could tender from and after the date of Opinion No. 460 "was shown by the record" to be 30,869 Mcf. However, a review of the references cited by Southern, namely Exhibit 1, item 29 and Exhibit D, page 4 does not support the reduction now claimed. The 30,869 Mcf figure is nothing more than a report of the "daily average quantity purchased" by Southern from Sinclair Oil & Gas Company in the twelve months ending with the last day of February 1964, and may or may not be identical with the *maximum* daily quantity of gas delivered to United for transportation during the period, which is the significant and determinative figure. Moreover, the quantity reported at Exhibit D, page 4, is merely a restatement, at a different pressure base, of figures appearing at page 1 of Exhibit D, and which, by Southern's own admission, are not stipulated to as necessarily correct. Although Southern presently asserts that it has not tendered for transportation a quantity greater than 30,000 Mcf on any day since April 2, 1964, the lowest most recent maximum daily quantity established by the record is 35,294 Mcf. Accordingly the petition for modification will be denied.

In Opinion No. 460 we stated:

> If Southern, at a time or times subsequent hereto, desires to have this amount [35,294 Mcf per day] still further reduced * * * it may make a further application to the Commission.

Southern's alternative complaint, wherein it seeks an immediate reduction in the maximum daily quantity applicable to the transportation service to 30,000 Mcf at 14.9 psia, constitutes such further application in accordance with the

opinion. United, in its answer, states that it is ready to participate in a hearing called thereon. The complaint affords adequate basis to order that a new proceeding be instituted for the submission of such relevant evidence as the parties may desire to present on the subject of the just and reasonable current billing demand to be required under Rate Schedule No. T–3. As in the earlier proceeding, we shall provide for the convening of a prehearing conference in order to afford the parties an opportunity to stipulate all relevant facts. Dates for the filing of evidence and petitions or notices of intervention are designated hereinafter. The Presiding Examiner will be empowered to issue such further procedural orders as may be appropriate to effectuate action on and disposition of the instant complaint.

The Commission finds:

(1) The assignments of error and grounds for rehearing set forth in the application for rehearing filed in this proceeding present no facts or legal principles which would warrant any change or modification in the Commission's Opinion No. 460 and accompanying order.

(2) The petition for modification of Opinion No. 460 should be denied.

(3) It is necessary and proper in the public interest and to aid in the enforcement of the provisions of the Natural Gas Act and the Rules and Regulations thereunder:

(a) That a new proceeding be instituted as hereinafter ordered limited to the sole issue of the just and reasonable billing demand required to be paid by Southern to United for the transportation service provided under United's Rate Schedule No. T–3 from and after the date of the Commission's order in the said proceeding.

(b) That in order to effectuate the purpose of such proceeding an opportunity be provided for the submission of evidence addressed to the aforesaid issue; and

(c) That a prehearing conference be convened before a Presiding Examiner for the purpose of arriving at a stipulation of relevant and material facts and for such further action as may be appropriate to secure expeditious disposition of the complaint filed by Southern on June 24, 1965. The Presiding Examiner shall issue his decision on the matter in accordance with Section 1.30 of the Rules of Practice and Procedure.

The Commission orders:

(A) The application for rehearing filed by Southern on June 24, 1965, is hereby denied.

(B) The petition for modification of Opinion No. 460 is denied.

(C) Pursuant to the authority of the Natural Gas Act, particularly Sections 4, 5, 15 and 16 thereof, the Commission's Rules of Practice and Procedure and the Regulations Under the Natural Gas Act, a new proceeding is hereby instituted for the purpose of determination of the complaint filed by Southern on June 24, 1965, as set out in paragraph (3) above.

(D) Southern shall file its evidence in the proceeding on or before August 10, 1965; United and all other parties shall file their evidence on or before August 27, 1965.

(E) Pursuant to the provisions of Section 1.18 of the Rules of Practice and Procedure, a prehearing conference shall commence at 10:00 a.m. (EDST) on September 7, 1965, in a hearing room of the Federal Power Commission, 441 G Street NW., Washington, D.C., for the purpose of effectuating the intent of the Commission as set forth above.

(F) Presiding Examiner Ewing G. Simpson, or any other officer or officers of the Commission designated by the Chief Examiner for that purpose, shall preside at the prehearing conference in accordance with the provisions of Section

2.59 of the Rules and Regulations and shall have authority to take such action and to issue such further orders as may be appropriate to effectuate action on and disposition of the complaint.

(G) Petitions to intervene and notices of intervention in the proceeding may be filed with the Federal Power Commission, Washington, D.C., in accordance with the Commission's Rules of Practice and Procedure, Sections 1.8 and 1.37(f) [18 CFR 1.8, 1.37(f)], on or before August 3, 1965.

Commissioner Ross *dissenting* for reasons set forth in his separate statement accompanying Opinion No. 460.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

UNITED GAS PIPE LINE COMPANY, DOCKET NO. CP65-337

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 20, 1965)

On April 22, 1965, as supplemented June 11, 1965, United Gas Pipe Line Company (Applicant) filed an application in Docket No. CP65-337 pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain natural gas facilities and the sale of natural gas to the Town of Walnut Grove, Mississippi, all as more fully set forth in the application.

Applicant seeks authority to construct and operate approximately 20 feet of 2-inch line and a positive meter and regulator station and appurtenant facilities on Applicant's 6-inch Jackson-Philadelphia lateral in Scott County, Mississippi, to be used for the sale and delivery of natural gas to the Town of Walnut Grove for resale and distribution through the proposed distribution system of said town and the rural customers located along Walnut Grove's line located in Scott and Leake Counties, Mississippi.

The estimated annual and peak day sales of natural gas by Applicant to Walnut Grove for the first three years are as follows:

	First year	Second year	Third year
Annual (Mcf)	96,000	99,032	123,736
Peak day (Mcf)	1,324	1,368	1,469

The estimated cost of Applicant's proposed facilities is $8,923, which will be financed from current working funds.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 16, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application, supplement, and exhibits submitted in support of the authorizations sought, and upon consideration of the record,

The Commission finds:

(1) Applicant, United Gas Pipe Line Company, a Delaware corporation having its principal place of business in Shreveport, Louisiana, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the

Commission in its order of November 10, 1942, in Docket No. G–232 (3 FPC 863).

(2) The proposed construction and operation of facilities and sale of natural gas by Applicant as hereinbefore described, and as more fully described in the application, supplement thereto and exhibits in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) The aforesaid construction and operation of facilities and sale of natural gas are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to the Applicant in this proceeding, authorizing the construction and operation of facilities and the sale of natural gas as more fully described in the application, supplement and exhibits in this proceeding, subject to the jurisdiction of the Commission, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be completed and placed in actual operation, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations within 6 months of the date on which this order issues.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

COMMUNITY PUBLIC SERVICE COMPANY, DOCKET NO. E–7231

ORDER AUTHORIZING ISSUANCE OF FIRST MORTGAGE BONDS AND PREFERRED STOCK

(Issued July 21, 1965)

Community Public Service Company (Applicant), incorporated under the laws of the State of Texas and doing business as a qualified foreign corporation in the State of New Mexico, with its principal place of business at Fort Worth, Texas, filed an application on June 16, 1965, as amended June 25, June 30, and July 8, 1965, for an order, pursuant to Section 204 of the Federal Power Act, authorizing the issuance of $5,000,000 maximum principal amount of First Mortgage Bonds, Series H, due 1995, to be sold at competitive bidding, and the issuance and sale of a maximum of 30,000 shares of 4.75% Cumulative Preferred Stock, Series C, par value $100 per share or an aggregate par value of $3,000,000. Applicant requests that the proposed issuance and sale of Preferred Stock be exempted from the Commission's competitive bidding requirements.

Applicant proposes to issue the Bonds under an Indenture of Mortgage and Deed of Trust, dated as of November 1, 1944, from Applicant's predecessor,

Community Public Service Company, a Delaware corporation, to City National Bank and Trust Company of Chicago, Trustee, as heretofore supplemented and as to be further supplemented by a proposed Ninth Supplemental Indenture, to be dated as of August 1, 1965, from Applicant to Continental Illinois National Bank and Trust Company of Chicago, successor Trustee.

On or about July 27, 1965, Applicant proposes to invite sealed, written bids for the purchase of the Bonds by newspaper publication and by distribution of a Public Invitation for Bids, which will set forth the terms and conditions relating to bids, together with a Form of Bid and a form of Purchase Contract. Each bid, whether by a single bidder or by a group of bidders, must be on the Form of Bid furnished by Applicant and must be for the purchase of all the Bonds. Each bid shall specify, among other things, (1) the coupon rate of the Bonds, which shall be a multiple of one-eighth of 1%; (2) the price, exclusive of accrued interest, to be paid to Applicant for the Bonds, which shall not be less than 100% or more than 102¾% of the principal amount of the Bonds; and (3) that accrued interest on the Bonds from August 1, 1965, to the date of payment therefor and delivery thereof will be paid to Applicant.

Unless postponed, each bid for the purchase of the Bonds, whether by a single bidder or a group of bidders, must be presented to Applicant at 90 Broad Street, 19th Floor, New York, New York, before 11 a.m., New York Time, on August 3, 1965. Unless Applicant shall reject all bids, which it reserves the privilege to do, or shall exclude the bid of any bidder or any group of bidders for reasons specified in the statement of terms and conditions set forth in the Public Invitation for Bids, Applicant will accept the bid which shall result in the lowest annual cost of money to Applicant.

Each bid for the purchase of the Bonds must be accompanied by a certified or official bank check or checks in the aggregate amount of $150,000, payable in New York Clearing House funds.

By Commission letter dated May 11, 1965, Docket No. IN-972, Applicant was authorized to engage in negotiations for the underwriting and/or sale of the Preferred Stock. Pursuant to that authorization, Applicant employed Stone & Webster Securities Corporation (Stone & Webster) for the purpose of engaging in negotiations for the placement of the proposed Preferred Stock. The application states that Stone & Webster discussed the possible sale of the Preferred Stock with 25 prospective institutional purchasers. As a result of such discussions, informal commitments have been obtained from 11 institutions to purchase the 4.75% Preferred Stock at $100 per share. Applicant proposes to pay a finder's fee of 62½¢ per share or 0.625% of the sale price, which is $18,750, in the aggregate, in payment for Stone & Webster's services in finding buyers for the new Preferred Stock. Applicant proposes to issue the Preferred Stock on or about August 10, 1965.

In support of its request for an exemption from the Commission's competitive bidding requirements with respect to the proposed issuance and sale of its Preferred Stock, Applicant represents that the proposed terms of such sale are as satisfactory as may be expected for senior securities under current market conditions and compare very favorably with prices received by larger and better known electric utilities in recent preferred stock offerings.

Applicant will apply the proceeds, estimated to be in the net amount of $7,912,375, to be obtained from the proposed issuance and sale of Bonds and Preferred Stock to (1) retire its short-term bank loans now outstanding in the principal amount of $4,000,000*; and (2) reimburse its treasury for funds ex-

*The bank loans are evidenced by short-term unsecured promissory notes which Applicant was authorized to issue to provide funds for utility plant construction by Commission order issued April 12, 1965, Docket No. E-7209, 33 FPC 718.

pended on its 1965 construction program. That program is expected to require $12,292,000, of which amount $12,153,000 will be allocated to electric plant and $139,000 to gas plant. Since Applicant purchases most of its electric energy requirements, the major portion of its construction program will be devoted to electric transmission and distribution facilities.

Written notice of the application has been given to the Texas Railroad Commission and to the New Mexico Public Service Commission and to the Governor of each of those States. Notice of the application was also published in the Federal Register on July 10, 1965 (30 F.R. 8761), stating that any person desiring to be heard or to make any protest with reference to the application should on or before July 19, 1965, file with the Federal Power Commission, Washington, D.C., 20426, petitions or protests. No petition or protest or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Applicant, a Texas corporation, is a public utility within the meaning of Section 204 of the Federal Power Act subject to the jurisdiction of the Commission as heretofore described and set forth in the Commission's order issued April 24, 1963, *Community Public Service Company*, 29 FPC 829.

(2) The proposed issuances of Bonds and Preferred Stock, as described above, will constitute issuances of securities within the purview of Section 204 of the Act.

(3) Applicant is not organized and operating in a State under the laws of which the security issues here involved are regulated by a State commission within the meaning of Section 204(f) of the Act, and the proposed issuances of securities, are, therefore, not exempt by virtue of that Section from the requirements of Section 204 of the Act.

(4) The price per share of the 4.75% Cumulative Preferred Stock, Series C, to be received by Applicant, the dividend rate, and the finder's fee to be paid Stone & Webster, all as described above, are not unreasonable.

(5) There is no affiliation, direct or indirect, through directors, officers or stockholders, or otherwise between Applicant and Stone & Webster.

(6) Under the circumstances set forth above, sufficient cause has been shown for exempting the proposed issuance and sale of 4.75% Cumulative Preferred Stock, Series C, from the competitive bidding requirements of Section 34.1a(b) and (c) of the Commission's Regulations under the Federal Power Act.

(7) The proposed issuances of securities, as hereinafter authorized, will be for a lawful object, within the corporate purposes of the Applicant and compatible with the public interest, which is appropriate for and consistent with the proper performance by the Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably appropriate for such purposes.

(8) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) The proposed issuances of Bonds and Preferred Stock upon the terms and conditions and for the purposes specified in the application, as described above, are hereby authorized, subject to the provisions of this order.

(B) The proposed issuance and sale of Bonds at competitive bidding shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2(g) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2(h) of these Regulations relating to affiliation,

and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegram as contemplated by Section 34.9 of the Regulations;

(ii) The Commission shall have approved the price to be received by Applicant for the Bonds and the coupon rate thereof by a further order.

(C) The proposed issuance and sale of 4.75% Cumulative Preferred Stock, Series C, as described above, are hereby exempted from the competitive bidding requirements of Sections 34.1a(b) and (c) of the Commission's Regulations under the Federal Power Act.

(D) This authorization shall expire unless the transactions hereby authorized are consummated within 90 days from the date of issuance of this order.

(E) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuation, estimates or determinations of costs, or any other matter whatsoever which is now pending or which hereafter may come before this Commission or any other regulatory body.

(F) Nothing in this order shall be construed to imply any guarantee or obligation on the part of the United States in respect of any securities to which this order relates.

Before Commissioners: David S. Black, Acting Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

NORTHERN VIRGINIA POWER COMPANY, PROJECT NO. 2425

ORDER ISSUING LICENSE (MAJOR)

(Issued July 21, 1965)

Application was filed on November 14, 1963, by Northern Virginia Power Company (Applicant) of Winchester, Virginia, for a license under Section 4(e) of the Federal Power Act (Act) for constructed Project No. 2425, consisting of the Luray Development and the Newport Development, located on the Shenandoah River, in Page County, Virginia, in the region of the Towns of Luray and Newport. No lands of the United States are affected by the project.

The Luray Development was constructed in 1927 and has remained essentially unchanged. The Newport Development was constructed in 1923 and, except for the addition of one turbine and one vertically driven generator in 1925, has remained essentially unchanged.

The Department of the Army and the Chief of Engineers have advised that the plans of the project structures affecting navigation are satisfactory insofar as the interests of navigation are concerned and such plans were approved pursuant to Section 4(e) of the Act.

The Department of the Interior, in reporting on the application, recommended for inclusion in any license for the project the terms and conditions in the interests of fish, wildlife and recreation usually included in licenses for projects of the type herein under consideration.

The Department of Health, Education, and Welfare has advised that there is no anticipated adverse effects by the project on water quality.

In our order issued March 2, 1965,[1] we found that the Shenandoah River and its South Fork to at least Port Republic at river mile 156 is a navigable water of the United States. Project No. 2425 is situated within this stretch of the river.

[1] Northern Virginia Power Company, Project No. 2391 (33 FPC 340).

Since the application included no transmission facilities, we are herein reserving the right to determine at a later date what transmission facilities, if any, should be included in the license as a part of the project works.

The Exhibit R, submitted as part of the application, is a statement reciting that no plan has been proposed to provide recreational facilities to the public at either of the two project developments, but subject to restrictions in those areas which present a safety hazard, both developments are open to the public for fishing and boating use. The Virginia Department of Conservation and Economic Development has reported to the Commission that the project has no particular potential for future recreational development and that the existing means of access appear adequate for present use. In the circumstances, we are not approving the Exhibit R which was filed. By Article 32 herein, we are requiring Applicant to cooperate with Federal, State and local agencies in the interest of recreation in connection with the use of project lands and waters by the public and to report to the Commission at stated intervals thereafter on recreational needs and development.

For the reasons set forth in our Opinion No. 357 (27 FPC 830) the license herein granted shall have an effective date of April 1, 1962, and a termination date of December 31, 1993.

The Commission finds:

(1) Project No. 2425 affects navigable waters of the United States.

(2) Applicant is a corporation organized under the laws of the Commonwealth of Virginia, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the project.

(3) Public notice of the filing of the application has been given. No protests or petitions to intervene have been received. No conflicting application is before the Commission.

(4) The project does not affect a Government dam, nor will the issuance of a license therefor, as hereinafter provided, affect the development of any water resources for public purposes which should be undertaken by the United States.

(5) Subject to the terms and conditions hereinafter imposed, the project will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial public uses, including recreational purposes.

(6) The installed horsepower capacity of the project hereinafter authorized for the purpose of computing the capacity component of the administrative annual charge is 4,000 horsepower, and the amount of annual charges, based on such capacity, to be paid under the license for the project, for the costs of administration of Part I of the Act is reasonable.

(7) The exhibits designated and described in paragraph (B) below conform to the Commission's rules and regulations and should be approved as part of the license for the project.

The Commission orders:

(A) This license is hereby issued to Northern Virginia Power Company (Licensee) under Section 4(e) of the Federal Power Act (Act) for a period effective as of April 1, 1962, and terminating December 31, 1993, for the continued operation and maintenance of Project No. 2425, located on the Shenandoah River, a navigable water of the United States, subject to the terms and conditions of the Act, which is incorporated herein by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Project No. 2425 consists of:

(i) all lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined, and/or interest in such lands necessary or appropriate for the purposes of the project, whether such lands or interest therein are owned or held by the Licensee or by the United States; such project area and project boundary being more specifically shown and described by the following exhibits which formed a part of the application for license:

Exhibit J:

Sheet 1 (FPC No. 2425–1) General Map

Sheet 2 (FPC No. 2425–2) Map of Electrical Properties

Exhibit K:

Sheet 1 (FPC No. 2425–3) Map of Project Area—Newport

Sheet 2 (FPC No. 2425–4) Map of Project Area—Luray

(ii) project works consisting of: *Luray Development*—(1) a concrete buttress dam 525 feet long and 18½ feet high; (2) a reservoir with an area of 125 acres; (3) a powerhouse integral with the dam containing one 400 kw and two 600 kw generators; and (4) appurtenant electrical and mechanical facilities. *Newport Development*—(1) A concrete buttress dam 453 feet long and 24 feet high; (2) a reservoir with an area of 102 acres; (3) a powerhouse integral with the dam containing one 600 kw and two 400 kw generators; and (4) appurtenant electrical and mechanical facilities. Location and character of project works shown in above-cited exhibits and others designated as follows:

Exhibit L:

Sheet 1 (FPC No. 2425–5) Luray Dam and Power Plant—Plan, Elevation and Sections

Sheet 2 (FPC No. 2425–6) Newport Dam and Power Plant—Plan, Elevation and Sections; and

Exhibit M:

Two typewritten pages, "Luray Hydro Station" and "Newport Hydro Station", filed in the Commission November 14, 1963.

(iii) all other structures, fixtures, equipment or facilities used or useful in the maintenance and operation of the project and located on the project area, including such portable property as may be used or useful in connection with the project or any part thereof, whether located on or off the project area, if and to the extent that the inclusion of such property as part of the project is approved or acquiesced in by the Commission; also, all riparian or other rights, the use or possession of which is necessary or appropriate in the maintenance or operation of the project.

(C) This license is also subject to the terms and conditions set forth in Form L–3 (Revised August 1, 1964), 32 FPC 1114, entitled "Terms and Conditions of License for Constructed Project Affecting Navigable Waters of the United States", which terms and conditions, designated as Articles 1 through 29, are attached hereto and made a part hereof, except Article 25 thereof, and subject to the following special conditions set forth herein as additional articles:

Article 30. The Commission reserves the right to determine at a later date what additional transmission facilities, if any, shall be included in this license as part of the project works.

Article 31. The Licensee shall pay to the United States the following annual charge, effective April 1, 1962:

For the purpose of reimbursing the United States for the costs of administration of Part I of the Act, a reasonable annual charge as determined by the Commission in accordance with the provisions of its regulations, in effect

from time to time. The authorized installed capacity for such purposes is 4,000 horsepower.

Article 32. Licensee shall cooperate with State and local agencies in the development and maintenance of access areas and roads and such other facilities as may be necessary for full recreational utilization by the public of project lands and waters consistent with the terms of the license and the operation of the project. At the end of three (3) years of the date of issuance of this license and every fifth year thereafter, Licensee shall advise the Commission of the results of cooperation with State and local agencies and of further recreation development at the project.

Article 33. On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply for steam-electric, irrigation, industrial, municipal or similar purposes consistent with the primary objective of the project. The Licensee shall receive such reasonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

(D) The exhibits designated and described in paragraph (B) above are hereby approved as part of this license.

(E) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgment of the acceptance of this license, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

TEXAS EASTERN TRANSMISSION CORPORATION, DOCKET NO. RP65-59 AND THE PHILADELPHIA GAS WORKS DIVISION OF THE UNITED GAS IMPROVEMENT COMPANY, DOCKET NO. RP65-52

ORDER CONDITIONALLY APPROVING RATE REDUCTION AND DISMISSING COMPLAINT PROCEEDING

(Issued July 21, 1965)

Texas Eastern Transmission Corporation (Texas Eastern), on June 1, 1965, submitted a letter of intent proposing to file a reduction of 0.42¢ per Mcf in its jurisdictional rates, to be effective as of June 1, 1965 and also undertaking certain obligations with respect to refunds and rate reductions received from its producer suppliers (including Rayne Field); reserving the rights of all parties

and the Commission with respect to Rayne Field gas costs and finally providing for flow-through of liberalized depreciation tax benefits, subject to certain specified conditions.

The proposal was conditioned upon termination of the informal excess earnings review initiated by a letter from the staff dated December 14, 1964; the entry of an order unconditionally approving Texas Eastern's offer in its entirety and dismissing the complaint filed by The Philadelphia Gas Works Division of the United Gas Improvement Company against Texas Eastern in Docket No. RP65–52; such order becoming final and non-appealable within 60 days from the date of submission of the proposal and non-suspension of the revised tariff sheets to be filed by Texas Eastern containing the reduced rates set forth therein.

The proposed change in rates would effectuate an immediate annual reduction in Texas Eastern's jurisdictional rates in the sum of approximately $3,500,000 annually, based upon adjusted test year volumes.

The level of the basic rate reduction reflects the impact of a full year's operation of newly certificated facilities costing over $90 million dollars which were placed in service in November, 1964. The reduction also reflects the recent reduction in federal corporate income tax rate to 48 percent; lower cost of gas purchased from United Gas Pipe Line Company pursuant to a recent rate settlement in Docket No. RP65–1, *et al.* and the allowance of a 6.25 percent rate of return. All known and measurable changes scheduled to occur by October 1, 1965 have been fully reflected.

Texas Eastern's rate reduction proposal has resulted from numerous conferences held over a period of four and one-half months with the Commission staff. These conferences were initiated by letter of the Chief, Bureau of Natural Gas, dated December 14, 1964, as a consequence of the Commission's continuing supervision of natural-gas companies and its periodic review of the annual reports filed with the Commission by such companies.

The proposal is summarized in part as follows:

(1) Effective June 1, 1965, Texas Eastern's jurisdictional rates will be reduced to the level set forth in Appendix "A" hereto.

(2) Texas Eastern has agreed that it will further reduce the rates set forth in Appendix "A" to reflect the principles specified in the Commission's Opinion No. 417, issued on February 3, 1964, in *Alabama-Tennessee Natural Gas Company*, Docket No. G–5471, *et al.*, 31 FPC 208, by filing revised tariff sheets reflecting the flow-through of the excess of the tax deduction for liberalized depreciation over straight-line depreciation, as booked, and the deduction of accumulated deferred tax balances in Account No. 282 from the agreed upon rate base if and to the extent that:

(a) The Commission's Opinion Nos. 417, *supra*, and 417–A, 31 FPC 928, are affirmed on their merits by the court of last resort, and

(b) The Commission continues to apply the rate-making principles of Opinion No. 417 to pipeline companies under the Natural Gas Act on October 1, 1966.

If, however, Texas Eastern notifies the Commission on October 1, 1965 or October 1, 1966 that it has elected to cease using liberalized tax depreciation and in fact discontinues such use in its tax return for 1964 or 1965, its obligation to flow-through such annual tax savings shall be terminated, but it must nevertheless reduce its rates and make refunds to reflect the deduction of deferred tax balances in Account No. 282 from its rate base.

Should Texas Eastern claim liberalized depreciation in its 1964 tax return, but not in its 1965 tax return, it is obligated to refund to its jurisdictional customers annual liberalized tax depreciation savings for the one year period between October 1, 1965 and October 1, 1966 (as measured by the excess of

liberalized depreciation over straight-line depreciation for the 12 months ending October 1, 1965).

Should Texas Eastern continue using liberalized tax depreciation in both 1964 and 1965, it is obligated to flow-through the annual liberalized depreciation tax savings by a rate reduction effective either 20 days after Opinion No. 417 becomes final and non-appealable or on October 1, 1966, which ever date is later, and to also make refunds to its jurisdictional customers for the period from October 1, 1965 to the date of such prospective rate reduction.

(3) Texas Eastern's existing obligation to pass on gas supplier refunds applicable to gas purchased prior to June 1, 1965 (the effective date of the proposed new agreement) pursuant to the provisions of the Rate Settlement Agreement in Docket Nos. G–12706 and G–18841 conditionally approved by Commission order issued January 25, 1961, as amended February 21, 1961, 25 FPC 172, 324, is continued during the life of the reduced rates set forth in the new agreement. Additionally, with respect to gas purchased on or after June 1, 1965, Texas Eastern assumes the obligation to pass on the jurisdictional portion of any gas supplier refunds received from independent producers as a result of Commission orders in the gas supplier proceedings specifically listed in Appendix "B" of the proposal or in any superseding Section 4(e) rate proceeding, or received from Petroleos Mexicanos (Pemex) under a gas purchase contract dated September 27, 1955, as amended April 26, 1962, to the extent that such refunds represent refunds of the rates set forth in said Appendix "B". In addition to increased rate proceedings, such listed proceedings include temporary certificate proceedings (irrespective of express refund conditions) and any such pending proceedings which have been inadvertently omitted from that Appendix.

(4) During the period in which the rates provided for in the proposal remain in effect, Texas Eastern is obligated to reduce its rates to reflect Commission ordered reductions in the rates of its producer suppliers, which have become final, in the proceedings listed in said Appendix "B" or in any superseding Section 4(e) rate proceedings, or received under its above identified gas purchase contract with Pemex, to the extent that any such gas cost reductions are below the rates set forth in said Appendix and are not offset by increases in Texas Eastern's cost of purchased gas from such suppliers, calculated in accordance with the netting provisions of Article IV of the proposal.

(5) If Texas Eastern receives any refunds or rate reductions as a result of Commission action under the Natural Gas Act or any similar payments for past periods or any future cost reductions pursuant to the judgment of a State or Federal Court, under other laws and statutes, which are applicable to gas delivered pursuant to the Rayne Field transaction involved in Docket Nos. G–12446 and G–12447 and purchased after June 1, 1965, it is obligated to flow-through any and all such benefits to its jurisdictional customers by way of further rate reductions or refunds. This obligation matures when such Commission orders or court decrees become final and nonappealable. The flow-through of such refunds or similar payments by Texas Eastern is governed by the provisions of Article III of the agreement. Likewise, the flow-through of any rate reduction or cost reduction Texas Eastern receives is governed by the provisions of Article IV of the agreement. The agreement further provides that Rayne Field gas costs shall only be reflected in the computation required to be made under the said Article from, or after the effective date of any such rate reduction or cost reduction. Thus, Rayne Field gas costs will not enter into the computations made for the purpose of determining whether a reduction in Texas Eastern's rates is required unless and until those costs have been reduced by final and nonappealable action of either the Commission or the courts. However, once Rayne Field costs are so reduced Texas Eastern must recalculate all elements entering

into the determination of the need for a jurisdictional rate reduction pursuant to Article IV and compare the results of such recalculation—reflecting Rayne Field costs *ab initio*—with the results obtained absent those costs in order to determine the differential unit cost to be used for the purpose of measuring the refunds and rate reductions to be passed on by Texas Eastern to jurisdictional customers by virtue of lower Rayne Field gas costs, in accordance with the provisions of Article V of the agreement.

The agreement contains an express reservation, running in favor of the Commission, its staff, Texas Eastern and all other parties, to the effect that the inclusion of Rayne Field costs in the cost-of-service used in fixing the reduced rates; the filing of such rates with the Commission; the assent of any party with respect thereto and any approval thereof by the Commission shall be without prejudice to, and shall not waive, limit or restrict in any manner or to any extent any and all rights the Commission has under the Natural Gas Act or any positions, contentions, or rights of all other parties in any presently pending or later proceedings, before the Commission or the Courts, with respect to any issue or issues directly or indirectly relating to Texas Eastern's Rayne Field transaction which is involved in Docket Nos. G–12446 and G–12447. This broad reservation, among other purposes, makes it manifest that the inclusion of any express provision in the instant agreement dealing with Rayne Field may not be relied upon by any party to support any argument or inferences based upon the absence of similar flow-through provisions or reservations in the prior rate settlement in Docket Nos. G–12706 and G–18841. The agreement further stipulates the constituent elements of cost making up the total cost of Rayne Field gas recognized in the settlement cost-of-service and the related gas volumes associated therewith (fn. 4, to Article V, at p. 7).

(6) The proposed reduced rates shall not become effective unless:

(a) The informal excess earnings review initiated by the aforesaid letter of December 14, 1964, shall be terminated;

(b) The Section 5(a) complaint requesting institution of a rate reduction proceeding against Texas Eastern, filed by the Philadelphia Gas Works Division of the United Gas Improvement Company in Docket No. RP65–52, is dismissed by order of the Commission;

(c) Texas Eastern's rate reduction proposal and all of the accompanying terms and provisions thereof are approved, without any modification or condition, by an appropriate order of the Commission;

(d) Such Commission order becomes final and nonappealable on or before September 1, 1965.

(7) The Commission is requested to waive compliance by Texas Eastern with the requirements of the Commission's general rules and regulations, including but not limited to, Section 154.22 thereof to the extent necessary to effectuate all of the provisions of the proposal.

(8) It is specifically understood and agreed that the rate level and terms and conditions embodied in the letter of intent represent a negotiated settlement with respect to Texas Eastern's rates and neither Texas Eastern, the Commission, its staff nor any other person shall be deemed to have approved, accepted, agreed or consented to any rate-making principle, or any method of cost-of-service determination, or any allocation underlying or supposed to underlie any of the rates or refunds provided for therein.

A total of four comments have been received from Texas Eastern's jurisdictional customers. One of these was submitted by Consolidated Edison Company of New York, Inc. which favors the proposal in its entirety and urges that the rate reduction be accepted for filing. A joint comment has been submitted on

behalf of Brooklyn Union Gas Company, Long Island Lighting Company and The Philadelphia Gas Works Division of the United Gas Improvement Company[1] (Eastern Customers). Public Service Electric and Gas Company of New Jersey also submitted comments. These customers do not object to approval of the proposal and have not requested the Commission to condition its approval thereof in any manner. The Commission has considered and appraised their comments, and except as otherwise noted herein, has determined them to be lacking in merit.

Philadephia Electric Company has filed a separate comment requesting that the Commission condition its approval of the rate reduction so as to specifically require that Texas Eastern flow-through all rate reductions received under Section 5(a) of the Act from producer or pipeline suppliers in pending Area Rate proceedings. We believe that it would be inappropriate to impose such a condition in the context of a voluntary rate reduction submitted as a "package proposal" and, also, note that no other jurisdictional customer has requested such relief.

The Eastern Customers, Public Service Electric and Gas Company and Philadelphia Electric Company have all commented upon the absence of any provision in the agreement requiring Texas Eastern to flow-through refunds and rate reductions received from its pipeline gas suppliers.

Texas Eastern buys gas from United, Texas Gas and Southern Natural. At the present time, none of these pipeline suppliers are collecting increased rates subject to refund pursuant to Section 4(e) of the Act. Nevertheless, their existing rates are *contingent*, rather than *firm*, to the extent that they are obligated by virtue of outstanding rate settlements or rate orders to flow-through refunds and rate reductions received from their own gas suppliers or to make other conditional rate reductions. In addition, Texas Eastern's recognized gas costs in the instant settlement cost-of-service include the presently effective rates of these pipeline suppliers which are subject to downward adjustment. Furthermore, these supplier refunds and rate reductions stem from our own processes and the exercise of our statutory duty to protect the public interest in "just and reasonable rates". In view of the foregoing considerations, we do not believe that it would be equitable or consistent with the aim of the Act to permit Texas Eastern to reap and retain the sole and exclusive benefit of regulatory action undertaken with the view to protecting the interests of ultimate consumers, rather than pipeline purchasers of gas. Accordingly, the Commission believes that it is in the public interest to condition our approval of the terms and conditions of this proposal to impose the same flow-through obligations on Texas Eastern with respect to pipelines as it has voluntarily assumed with respect to producers.

This change does not affect in any degree or in any manner the extent to which Texas Eastern would otherwise flow-through producer supplier rate reductions. For, Article IV requires Texas Eastern to reduce its rates when the current weighted average cost is less than the base cost but provides that "tne amount of the 'cost reduction' shall be determined by multiplying the difference in unit cost by the volumes of gas purchased from producer suppliers" (p. 6). Thus, while a greater amount of producer reductions are now required to produce an equivalent incremental change in unit cost, that change will be multiplied by the larger combined producer-pipeline volumes in order to yield the same absolute "cost reduction".

[1] Philadelphia Electric Company has joined in these comments to the extent that they are not inconsistent with its own separate comments.

With this single modification, the Commission finds that the acceptance of Texas Eastern's package proposal as tendered will be in the public interest because it will result in an immediate rate reduction, provides for contingent further rate reductions related to liberalized depreciation and Rayne Field and updates Texas Eastern's current obligations with respect to refunds and rate reductions relating to contingent gas prices which have become effective since October 27, 1959.

The Commission finds:

(1) Good cause exists for waiving the requirements of Section 154 of the Commission's Regulations under the Natural Gas Act in order that the rate reductions set forth in Appendix "A" hereto may become effective on June 1, 1965, as hereinafter ordered.

(2) The proposed reduced rates and Texas Eastern's agreement to further reduce its rates as provided in the proposal, are proper and in the public interest in carrying out the provisions of the Natural Gas Act, and should be accepted for filing and made effective as hereinafter provided and ordered.

(3) Good cause exists for dismissing the Section 5(a) complaint filed against Texas Eastern, in Docket No. RP65-52, and terminating the informal excess earnings review initiated by the letter of December 14, 1964, from the Chief of the Bureau of Natural Gas.

The Commission orders:

(A) The provisions of Section 154 of the Commission's Regulations under the Natural Gas Act are hereby waived subject to the terms and conditions of this order and of the rate reduction proposal.

(B) Articles III and IV of the agreement embodied in the letter of intent, are hereby modified to provide that Texas Eastern shall flow-through any and all refunds and rate reductions received from its pipeline gas suppliers to the same extent, and on the same terms and conditions, as it shall flow-through refunds and rate reductions received from its producer-suppliers; that the base cost of gas shall be 20.89¢ per Mcf (as shown in Appendix "B" hereto) instead of 16.17¢ per Mcf and, that Appendix "B" of the said agreement shall be modified by the incorporation (at the end of page 8 thereof) of the contingent rates of pipeline suppliers shown in Appendix "C" of this order.

(C) Texas Eastern shall, over the signature of a responsible officer, file with the Commission within 10 days of the date of issuance of this order, in writing and under oath, an original and one copy of its acceptance or rejection of the terms and conditions of this order.

(D) Texas Eastern's proposal to reduce its rates to the level set forth in Appendix "A" hereto; to further reduce its rates subject to specified contingencies and to flow-through supplier refunds and rate reductions, as herein modified, is approved and made effective as later specified herein subject to the terms and conditions of this order.

(E) Texas Eastern shall file within 15 days next following the date of issuance of this order revised tariff sheets conforming to the rates set forth in Appendix "A" hereto. Upon the filing by Texas Eastern of such sheets and acceptance thereof, evidenced by letter addressed to Texas Eastern by the Secretary of the Commission, such tariff sheets shall be effective as of June 1, 1965.

(F) The Section 5(a) complaint against Texas Eastern, filed by The Philadelphia Gas Works Division of the United Gas Improvement Company in Docket No. RP65-52, is hereby dismissed and the informal excess earnings review initiated by the aforesaid letter of December 14, 1965, is hereby terminated, subject to the terms and conditions of this order and of the rate reduction proposal.

(G) Texas Eastern shall faithfully discharge each of the obligations it has assumed in the agreement embodied in its letter of intent, as modified and summarized in the order, and shall comply with each of the provisions of this order.

(H) Within 20 days of making refunds in accordance with paragraph (C) herein, Texas Eastern shall report to the Commission, in writing and under oath, the amount of the refund made to each customer, showing separately the amount of principal and interest so paid together with a computation showing the manner in which such refund was determined, and shall serve a copy of such report upon each customer receiving a refund.

(I) This order is without prejudice to any findings or orders which have been made or may hereafter be made by the Commission and is without prejudice to any claims or contentions which may be made by the Commission, Texas Eastern, the Commission staff, or any other party affected by this order, in any proceedings now pending or hereafter instituted by or against Texas Eastern or any other persons or parties affected by this order.

ALABAMA POWER COMPANY, PROJECT NO. 2146

ORDER MODIFYING LICENSE ARTICLE

(Issued July 22, 1965)

Application was filed on October 8, 1964, by Alabama Power Company for modification of Article 32 of its license for Project No. 2146 situated in the Coosa River, Alabama.

Article 32 presently requires, among other things, unselective clearing by the licensee of the bottoms and margins of the project reservoirs. The modification sought would provide for the selective clearing of the reservoirs in the interest of attaining the full recreational potential of the reservoirs by providing fish and wildlife refuge and would provide for the preservation of such areas. Cleared areas will be devoted to other recreational uses such as boating, skiing and other water sports.

The Commission finds:

Modification of Article 32 of the license for Project No. 2146, as hereinafter provided, is in the public interest.

The Commission orders:

Article 32 of the license for Alabama Power Company's Project No. 2146 is hereby modified to read as follows:

Article 32. Licensee shall, prior to impounding water in the reservoirs, dispose of all temporary structures, unused timber, brush, refuse or flammable material resulting from the clearing of the land or from the construction and maintenance of the project works; and shall clear all lands in the reservoir areas up to the normal elevations of the power pools, except lands which are planned to be left uncleared—in the interest of attaining the full recreational potential and the full fish and wildlife conservation potential—in the Lock 3 and Jordan No. 2 developments and in the enlarged reservoir portion of the Lay redevelopment, as will be shown in a plan to be developed cooperatively by the Licensee and the State Department of Conservation and the State Department of Public Health of Alabama after consultation with the United States Fish and Wildlife Service and the District Engineer, U.S. Army Engineer District, Mobile, Alabama, provided that the plan agreed to

will be filed for Commission approval and, provided further, that in the event agreement cannot be reached in the formulation of such a plan for selection of areas to be left uncleared, the Commission reserves the right to make such determination after notice and opportunity for hearing. The clearing of the land and disposal of the material shall be done with due diligence and to the satisfaction of the authorized representative of the Commission.

Before Commissioners: David S. Black, Acting Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

GEORGIA POWER COMPANY, PROJECT NO. 1218

ORDER APPROVING REVISED PROJECT EXHIBITS

(Issued July 22, 1965)

On October 19, 1964, Georgia Power Company, licensee for the Flint River Project No. 1218, filed for Commission approval revised Exhibit L drawings and a revised Exhibit M for the project located on the Flint River near Albany, Georgia.

The drawings show changes in the project structures of an emergency nature undertaken by the licensee during the 1964 construction season. These major repairs and modifications were initiated when erosion and undercutting of the limestone foundation supporting the main spillway piers and buttresses endangered the structure. Construction was commenced in July of 1964 and was completed in December of 1964. The licensee advised our Atlantic Regional Office of its plans and submitted construction drawings and specifications in July 1964.

The main Flint River spillway section was modified by extensive reconstruction of the foundation of the slab and buttress overflow structure. The Muckafoonee dam and spillway were modified by replacing the tilting flashboards with vertical lift gates and the construction of an emergency free-crest spillway over part of the earth embankment.

The modification of the Muckafoonee spillway has increased the total project spillway capacity from 99,000 cfs to about 109,000 cfs before overtopping. The 1925 flood peak of record, 92,000 cfs, resulted in an estimated reservoir elevation of 190.5 feet and an estimated tailwater elevation of 187.5 feet, a differential of only 3 feet. As modified, the differential between reservoir elevation and tailwater elevation would be about 2.0 feet at the time of any future overtopping of the earth embankments. Considering the small differential between headwater and tailwater at the time of overtopping, failure of the project earth embankment, if any, would be gradual and the peak flood flow would not be increased appreciably downstream. Under those circumstances, the spillway is considered adequate.

The U.S. Corps of Engineers have advised that the revised Exhibit L drawings were satisfactory and the tracings were approved pursuant to Section 4(e) of the Federal Power Act insofar as the interests of navigation are concerned.

The Commission finds:

The following described revised exhibits conform to the Commission's rules and regulations and should be approved as part of the license for the project, and the exhibits described herein as superseded should be eliminated from the license for the project:

EXHIBIT L: PLANS OF STRUCTURES

Sheet No.	Title	FPC No.	FPC No. Superseded
1	Plan of Development & Typical Sections of Dike & Channel..	1218-10	1218-4
3	Flint River Dam Plan, Elevation, & Spillway Section.....	1218-11	1218-6
4	Muckafoonee Spillway Plan, Upstream Elevation & Sections.	1218-12	1218-8

Exhibit M (Revised October 1, 1964) comprising three typewritten pages filed October 19, 1964, superseding Exhibit M filed September 7, 1932.

The Commission orders:

The revised exhibits described in the above finding are approved as part of the license for Project No. 1218, and the exhibits described in the same finding as being superseded are eliminated from the license for the project.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

ORANGE AND ROCKLAND UTILITIES, INC., DOCKET NO. E-7230

ORDER AUTHORIZING ACQUISITION OF COMMON STOCK

(Issued July 22, 1965)

Orange and Rockland Utilities, Inc. (Applicant), a corporation organized under the laws of the State of New York and qualified to do business in the States of New York and New Jersey with its principal business office at Nyack, New York, filed an application on June 14, 1965, for authority pursuant to Section 203 of the Federal Power Act to acquire 20,000 shares of Common Stock, $100 par value, of Rockland Electric Company (Rockland Electric) a wholly-owned subsidiary.

Applicant is engaged in furnishing electrical energy in all of Rockland County, most of Orange County and the easterly portion of Sullivan County, all in New York. Applicant also furnishes electrical energy to Rockland Electric a New Jersey corporation which operates in the northern parts of Bergen and Passaic Counties and a small portion of Sussex County in New Jersey, and to another subsidiary, Pike County Light & Power Company which operates in Pennsylvania.

Rockland Electric now has outstanding Common Stock of 42,000 shares, $100 par value, total par value $4,200,000, all owned by Applicant. Applicant now proposes to acquire from Rockland Electric, 20,000 additional shares of Common Stock, $100 par. The new shares are to be purchased for $2,000,000 in cash, this amount being the total par value of the new shares. Rockland Electric will use the $2,000,000 from the new stock, plus $2,000,000 from new bonds to be issued, to pay off short-term notes which are expected to total about $4,000,000. These notes heretofore authorized by Commission order issued December 11, 1961 in Docket No. E-7015, 26 FPC 823, have been issued to provide funds for construction of a new plant.

Applicant represents that the operations of Rockland Electric have been integrated with the operations of the Applicant to such an extent that the electric properties of the two companies constitute and are operated as one continuous electric system and that in order to maintain the integration of the systems and to enable Rockland Electric to secure favorable terms for debt financing, it is in the public interest that Applicant continue to own capital stock of Rockland Electric.

Written notice of the application has been given to the Public Service Commission of the State of New York, and the Board of Public Utility Commissioners of the State of New Jersey and the Governors of those States. Notice of the application was also published in the Federal Register on June 30, 1965 (30 F.R. 8353), stating that any person desiring to be heard or to make any protest with reference to the application should on or before July 7, 1965, file protests or petitions with the Federal Power Commission, Washington, D.C., 20426. No protest or petition or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Applicant, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act subject to the jurisdiction of the Commission as heretofore determined and set forth in the Commission's order issued August 13, 1958 in the matters of *Orange and Rockland Utilities, Inc.* and *Rockland Electric Company*, in Docket No. E–6827 (20 FPC 205).

(2) Rockland Electric, a corporation is a public utility within the meaning of Section 203 of the Federal Power Act subject to the jurisdiction of the Commission as heretofore determined and set forth in the Commission's order issued August 13, 1958 in the matters of *Orange and Rockland Utilities, Inc.* and *Rockland Electric Company*, in Docket No. E–6827 (20 FPC 205).

(3) By the proposed transaction, as described above, Applicant will acquire securities of Rockland Electric, another public utility, within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(4) The proposed acquisition by Applicant of 20,000 shares of Common Stock of Rockland Electric, as recited above, upon the terms and conditions specified in the application and subject to the provisions of this order will be consistent with the public interest as expressed in Section 203 of the Federal Power Act for the reasons set forth above.

(5) Applicant is not subject to a requirement of the Public Utility Holding Company Act of 1935 or of a rule, regulation, or order thereunder, which would exempt it, pursuant to Section 318 of the Federal Power Act, from the requirements of Section 203 thereof with respect to the matter with which this order is concerned.

(6) Rockland Electric is organized and operating in the State of New Jersey under the laws of which its security issues with the exception of short-term notes are regulated by a State Commission within the meaning of Section 204(f) of the Act; and the proposed issuance of Common Stock is exempt by virtue of that Section from the requirements of Section 204 of the Act.

(7) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) The proposed acquisition by Applicant of 20,000 shares of Common Stock of Rockland Electric, as described above, is hereby authorized and approved upon the terms and conditions and for the purposes set forth in the application, subject to the provisions of this order.

(B) This authorization shall expire unless the transaction herein authorized and approved is consummated within 90 days from the date of issuance of this order.

(C) The foregoing authorization and approval is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuations, estimates or determinations of costs, or any other matter whatsoever now pending or which may come before this Commission or any other regulatory body

Before Commissioners: David S. Black, Acting Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

SIERRA PACIFIC POWER COMPANY, PROJECT NOS. 938, 1191, 1262 AND 1446

ORDER ACCEPTING SURRENDER OF LICENSES (TRANSMISSION LINE)

(Issued July 22, 1965)

On June 1, 1965, Sierra Pacific Power Company, licensee for the above-designated transmission line projects, filed under Section 6 of the Federal Power Act for surrender of its licenses for the projects occupying lands of the United States within the State of Nevada.

The application was filed pursuant to the Commission's March 29, 1965, 33 FPC 652, order approving transfer of ten transmission line licenses, including the subject licenses, from Sierra Pacific Power Company to Pacific Nevada Power Company, the latter presently being known as Sierra Pacific Power Company. In its March 29, 1965 order, the Commission stated that according to a staff study all of the transmission lines designated in the order are distribution lines and not primary lines or parts of a "project" as defined in Section 3(11) of the Federal Power Act, and that its approval of transfer of the licenses was subject to the requirement that the transferee obtain authority from the appropriate Government agency having supervision of the Government lands involved and then apply for surrender of its licenses for the lines.

The Nevada Land Office, Bureau of Land Management, Department of the Interior, Reno, Nevada, which has supervision over the lands of the United States occupied by the lines, has advised that the permits for the continued occupancy of Government lands by the lines will be issued as of the date of surrender of the licenses.

The Commission finds:

Acceptance of surrender of the licenses for transmission line Project Nos. 938, 1191, 1262 and 1446 is appropriate, as hereinafter provided.

The Commission orders:

Surrender of the licenses for transmission line Project Nos. 938, 1191, 1262 and 1446 is accepted, effective as of May 31, 1965, subject to the payment of annual charges within 30 days from the date of issuance of this order in the amount of $133.57 for the period January 1, 1965, through May 31, 1965, as follows:

Project No. 938	Land charges only	Total	$21.39
Project No. 1191	Administrative charge		2.07
	land charges		50.13
		Total	52.20
Project No. 1262	Administrative charge		2.07
	land charges		10.87
		Total	12.94
Project No. 1446	Administrative charge		2.07
	land charges		44.97
		Total	47.04

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

NORTHERN NATURAL GAS COMPANY, CP65–1, CP65–91, CP65–338; NATURAL GAS PIPELINE COMPANY OF AMERICA, CP65–169, CP65–325; TRANSWESTERN PIPELINE COMPANY, CP65–208, CP65–236, CP65–237, CP65–320

ORDER GRANTING TEMPORARY CERTIFICATES

(Issued July 23, 1965)

Natural Gas Pipeline Company of America (Natural) and Transwestern Pipeline Company (Transwestern) filed applications on June 29, 1965, and July 6, 1965, respectively, for temporary certificates of public convenience and necessity authorizing Transwestern and Natural to construct and operate facilities and to exchange, transport, and sell natural gas in interstate commerce for resale as described in their respective applications under Docket Nos. CP65–320, CP65–325, and a portion of CP65–169 comprising Phase 1 of the consolidated proceedings in the above-entitled cases as delineated in the Commission's order issued herein on June 4, 1965, a public hearing on which was held July 12 and 14, 1965.

Natural requests authorization to construct and operate pipeline, compressor, and other facilities:

1. To increase the daily design sales capacity of its transmission system by 185,000 Mcf to a total of 2,154,000 Mcf;

2. To transport natural gas to be produced from reserves located in the West Cameron Blocks 17–49 Field Area, South Louisiana, to a point of connection with Natural's existing Gulf Coast line in Montgomery County, Texas;

3. To increase the maximum day withdrawal capacity of Natural's storage facilities by 50,000 Mcf to a total of 1,000,000 Mcf;

4. To transport gas which Natural will purchase from producers in the Indian Basin and Dagger Draw areas in Eddy County, New Mexico, to a point of connection with Transwestern's 24-inch West Texas lateral and to effect an exchange of such gas with Transwestern.

The facilities for which Natural requests temporary authorization to construct and operate are described in detail in Phase 1 hearing exhibit 71 and in Natural's application under Docket No. CP65–325. Natural estimated their total cost at $40,150,000.

Transwestern requests temporary authorization to construct, install, and operate the facilities described in its application under Docket No. CP65–320, which was included in the Phase 1 hearing, namely 35.2 miles of 24-inch loop line along Transwestern's West Texas lateral; an additional 1,000 horsepower compressor near Transwestern's existing Roswell compressor station; and measuring stations at proposed points of delivery of gas to Natural in the Panhandle area of Texas at a total estimated cost of approximately $3,391,000.

Natural and Transwestern request temporary authorization to exchange up to 130,000 Mcf of natural gas per day pursuant to an "Agreement for the Temporary Exchange of Gas" (Phase 1 hearing exhibits 66 and 75) as described in their applications under Docket Nos. CP65–325 and CP65–320, respectively, pending final determination of, and the Commission's decision in, Phase 2 of the consolidated proceedings in the above-captioned cases as delineated in the Commission's order issued June 4, 1965. The facilities for which Natural and Transwestern request temporary authorization include the facilities which are needed to implement the exchange of gas but are not limited to such facilities.

Natural also requests temporary authorization to transport in interstate commerce and sell additional volumes of natural gas up to 192,400 Mcf [1] per day on a firm basis commencing December 1, 1965, to seventeen present resale customers and to one present direct industrial customer. Natural alleged that its customers have executed precedent agreements to purchase all of the requested additional volumes of gas and also the proposed 50,000 Mcf per day increase in storage withdrawal capacity.

Natural alleged, and submitted supporting evidence, that the additional volumes of gas which it proposes to sell and deliver will be needed by its customers during the winter of 1965–66 in order to avoid serious shortages of gas which would require curtailment of firm service; that it must commence construction by August 1, 1965, if the proposed facilities are to be put in operation in time for the 1965–66 winter heating season; and that the temporary certificates requested by Natural and Transwestern are needed in order to assure maintenance of adequate service in Natural's market areas within the terms of Section 7(c) of the Natural Gas Act and of Section 157.17 of the Commission's Regulations.

Transwestern noted in its application for a temporary that Gulf Pacific Pipeline Company had no objection to the installation of the facilities requested provided the certificate issued contains the following condition:

> The authorization issued herein is without prejudice to the application of Gulf Pacific Pipeline Company in the consolidated proceedings at CP63–204, *et al.*

It noted further that the Commission staff had indicated that the certificate should contain the following condition:

> In the event the final determination in the comparative proceedings in FPC Docket No. CP65–1, et al. is adverse to Transwestern and its applications filed in CP65–208, CP65–236 and CP65–237 are denied and additional sales or deliveries from its system have not materialized, Transwestern will not include the cost of the facilities installed for the interim service in its rate base in any rate increase proceeding until such time as Transwestern can make proof that the additional capacity which such facilities provide is needed.

Transwestern is willing that such conditions be included. Transwestern further indicated that it was willing that the temporary authorization be conditioned upon a guarantee that the "*interim exchange arrangement* will not cause the Btu of gas delivered by Transwestern to California to fall below 1065 Btu per cubic foot." We have conditioned the issuance of this temporary certificate to reflect each of the above set forth conditions.

Transwestern stated in its application that the temporary authorization "*should expressly provide* that Transwestern would not be required to reduce its existing rates as a result of revenues realized or to be realized from the interim exchange arrangement with Natural *and* that if the interim exchange arrangement is approved after hearing, Transwestern will be permitted to file and place into effect the rates agreed upon with Natural for that service in the March 19, 1965 agreement." As we understand the primary contested issue in the Phase I proceeding concerns allegations by California that excess revenues over the cost incurred for this specific project should be flowed through for the benefit of the California consumers. It would be inappropriate for us to prejudge that issue in this order. Accordingly, we can not and will not find, in granting this temporary certificate to Transwestern, that it should not be required to reduce its existing rates or that after the hearing it will be permitted to file and place into effect the agreed upon rates. We expressly make no finding on this

[1] Billing units of Mcf at 1,000 Btu per cubic foot and 14.65 psia at 60 degrees F.

question at this time. We understand that the hearing in that phase of the proceeding has been completed and that the matter is now pending before the examiner for decision. In all likelihood, therefore, the specific issue presented will be decided by us prior to the time the facilities for which temporary authorization is hereby requested are put in operation pursuant to the temporary certificate we grant herein.

The Commission finds:

(1) The Applicants, Natural Gas Pipeline Company of America and Transwestern Pipeline Company, Delaware corporations having their principal offices and places of business in Chicago and Houston, respectively, are engaged in the transportation of natural gas in interstate commerce and the sale in interstate commerce of natural gas for resale, and they are natural gas companies as defined in the Natural Gas Act.

(2) The proposed facilities for which the Applicants request temporary certificates of public convenience and necessity will be used for the transportation and sale for resale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and the construction and operation thereof will be subject to the requirements of Section 7(c) of the Natural Gas Act.

(3) The Applicants are able and willing to do the acts and perform the services proposed in their respective applications in Docket Nos. CP65-320, CP65-325, and a part of CP65-169, as embraced in Phase I of the hearing, and to conform to the provisions of the Natural Gas Act and the Rules and Regulations of the Commission thereunder.

(4) The temporary certificates requested by the Applicants are needed in order to assure maintenance of adequate service to Natural's present customers within the terms of Section 7(c) of the Natural Gas Act and of Section 157.17 of the Commission's Regulations.

(5) Public convenience and necessity require that the temporary certificates issued hereinafter and the rights granted thereunder be conditioned as hereinafter provided.

The Commission orders:

(A) A temporary certificate of public convenience and necessity is issued to each of the Applicants authorizing them to construct and operate the facilities and to transport, exchange and sell natural gas as described hereinbefore upon the terms and conditions of this order.

(B) The certificates issued by this order and the exercise of the rights granted thereunder are conditioned upon compliance by the Applicants with all applicable Regulations of the Commission under the Natural Gas Act, and particularly Section 157.20 of said Regulations.

(C) The certificates issued by this order and the exercise of any right thereunder are subject to the further condition that in the event that the Commission's decision in Phase II of the hearing, which will be held in the future in these consolidated proceedings, results in any of the temporarily-authorized facilities which are constructed by Natural or Transwestern not being permanently certificated, the cost of such facilities will be excluded from Transwestern's rate base and from Natural's rate base.

(D) The certificate issued to Natural by this order and the exercise of any right thereunder is subject to the further condition that the cost of facilities constructed by Natural to enable it to take gas produced in the West Cameron Block 17-49 Field Area, South Louisiana, which is to be purchased from The California Company, and in the Indian Basin Area and the Dagger Draw Area of New Mexico, will not be included in Natural's rate base until after FPC

certificates authorizing the sale of such gas have been issued to, and accepted by, The California Company and producers of gas in the Indian Basin, Dagger Draw and Bluitt areas who have contracts for the sale of such gas to Natural, and who are able to produce and sell to Natural such gas in volumes aggregating at least 130,000 Mcf per day.

(E) The temporary certificates issued to Natural and Transwestern by this order are subject to further conditions, as follows:

(1) The exchange charge proposed by Natural and Transwestern in their "Agreement for the Temporary Exchange of Gas" dated March 19, 1965, shall remain in effect until a final order is issued by the Commission in Phase I of the proceedings under Docket No. CP65–1, *et al.*

(2) Natural shall enrich the gas delivered to Transwestern from reserves in the Indian Basin and Dagger Draw areas in accordance with its letter agreement with the Pacific Lighting Companies dated April 16, 1965 (Phase I hearing exhibit 67) and accepted by the Pacific Lighting Companies by letter dated July 7, 1965 (T. 814).

(3) Transwestern shall guarantee that, subject to the assurances given by Natural, the exchange of gas pursuant to their temporary exchange agreement will not cause the thermal content of gas delivered by Transwestern to California to fall below 1,065 Btu per cubic foot.

(4) The certificates issued herein shall not prejudice in any respect the application of Gulf Pacific Pipeline Company in the consolidated proceedings under Docket No. CP63–204, *et al.*

(5) The certificates issued herein shall be void unless they are accepted in writing by both Natural and Transwestern within seven days after the date of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

EASTERN SHORE NATURAL GAS COMPANY, DOCKET NO. CP65–365

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 26, 1965)

On May 17, 1965, Eastern Shore Natural Gas Company (Applicant) filed in Docket No. CP65–365 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain facilities and the transportation and delivery of natural gas, on an interruptible basis, to the plant of O. A. Newton & Son Company (Newton), Bridgeville, Delaware, all as more fully set forth in the application in this proceeding.

Specifically, Applicant proposes to tap its existing 6-inch transmission line and construct and operate approximately 1,600 feet of 2-inch lateral line to the plant of Newton. Newton's estimated third year peak day and annual requirements are 336 Mcf and 17,611 Mcf, respectively. Newton will use the gas to dry grain and to produce steam for feed manufacturing primarily in the summer and fall periods of relatively low demand for gas.

The estimated cost of the proposed facilities is $7,000.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 21, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Eastern Shore Natural Gas Company, a Delaware corporation having its principal place of business in Salisbury, Maryland, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order issued November 29, 1957, in Docket No. G-12200 (18 FPC 710).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation and delivery of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof and the proposed transportation and delivery of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed transportation and delivery of natural gas by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued authorizing Applicant, Eastern Shore Natural Gas Company, to construct and operate the proposed facilities and to transport and deliver natural gas as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be constructed and placed in actual operation and the transportation and delivery of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within six months from the date on which this order issues.

(D) The certificate issued herein is granted on the express condition that the interruptible service authorized herein shall be curtailed or interrupted to the extent required to meet existing or future contracted minimum delivery obligations of Applicant for firm service to its customers.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP65-352

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 26, 1965)

On May 5, 1965, Tennessee Gas Transmission Company (Applicant) filed in Docket No. CP65-352 an application, as supplemented May 17, July 2 and July 6, 1965, pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing construction and operation of facilities for the liquefaction, storage and vaporization of natural gas, and authorizing the sale of such natural gas to its General Service Customers in the New England Area, all as more fully set forth in the application.

Applicant proposes to install a liquefied natural gas (LNG) plant, a cryogenic in-ground LNG storage facility and regasification (vaporization) facilities at its compressor station No. 267 near Hopkinton, Massachusetts. By means of these facilities, natural gas will be taken from Applicant's mainline during off-peak periods, liquefied at a rate of 12,500 Mcf per day, and stored at a temperature of —260° Farenheit in two in-ground frozen bedrock containers. During winter peak periods, liquefied natural gas will be pumped from the storage containers, converted to the gaseous phase by addition of heat and re-introduction into Applicant's mainline for delivery on a firm basis to the 18 existing General Service Customers who have contracted with Applicant for LNG service.

Applicant has obtained contract commitments for the full service of 121,454 Mcf maximum daily LNG quantity and 3,032,176 Mcf maximum winter LNG contract quantity proposed in the subject application. In order to meet these daily and winter LNG obligations, Applicant will replace several lateral facilities with larger diameter pipe.

Total estimated cost of this project to Applicant is $14,950,000, which includes $13,924,000 for LNG plant and storage facilities, $690,000 for lateral replacement, $236,000 for meter station alterations and $100,000 for administrative expenses. Applicant will finance these costs initially with general funds or by means of $50,000,000 of revolving credit presently available. This credit will be retired in the future through Applicant's usual permanent financing, such as first mortgage bonds and stock.

On June 7, 1965, a joint petition to intervene herein was filed by The Manufacturers Light and Heat Company, United Fuel Gas Company and The Ohio Fuel Gas Company (Petitioners). The intervention states that Petitioners do not request a formal hearing and have no objection to the disposition of the instant application under the Commission's shortened procedure provided the Commission imposes conditions substantially equivalent to those prescribed in its order of July 3, 1963, *Transcontinental Gas Pipe Line Corporation*, Docket No. CP63-228, 30 FPC 38. By supplement filed herein July 6, 1965, Applicant stated its willingness to accept a certificate with such conditions. No other petitions to intervene have been filed.

At a hearing held on July 21, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits and supplements thereto, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Tennessee Gas Transmission Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of July 12, 1947, in Docket No. G-910 (6 FPC 777).

(2) The proposed construction and operation of facilities and sales of natural gas by Applicant hereinbefore described, as more fully described in the application in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed, and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The proposed construction and operation of facilities and sales of natural gas by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Applicant, Tennessee Gas Transmission Company, authorizing the construction and operation of facilities and sales of natural gas hereinbefore described, as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(2), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereinbefore described shall be constructed and placed in actual operation and the sales of natural gas shall be undertaken, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations within 36 months from the date on which this order issues.

(D) Applicant shall submit in a form acceptable to the Commission annual reports showing the pertinent operating data and the experienced associated costs covering the facilities and service authorized for each of the first three full years of service.

(E) Upon full development of all facilities authorized herein, Applicant shall notify the Commission of the date when it has delivered, on demand of its customers, the maximum LNG winter contract quantity of gas, or that it has been unable to so deliver this quantity. In the event that Applicant shall have been unable, because of mechanical or operational failure of the LNG facilities, to deliver the maximum LNG winter contract quantity of gas, it shall, in any rate determination, if so directed by the Commission, remove from its rate base an amount which shall be determined by multiplying the net original cost of plant and facilities authorized by a fraction the numerator of which shall be the annual winter contract quantity which Applicant was unable to deliver and the denominator of which shall be the maximum winter contract quantity of 3,032,176 Mcf of gas; provided, however, this said amount may again be included in Applicant's rate base in any rate determination if Applicant can deliver the maximum LNG winter contract quantity of gas during any winter withdrawal period.

(F) In any rate proceeding instituted after the liquefied natural gas facilities certificated have been transferred to gas plant in service, should the "test-period" (as presently defined in the Commission's Regulations) or any part thereof fall prior to the commencement of the full service of 121,454 Mcf per day

authorized herein, Applicant shall nevertheless reflect revenues and costs based upon such full service.

(G) Applicant shall not, in any rate proceeding, attempt to assess against any other class of service any deficiency in revenues for rendering the service certificated herein below the cost of service associated with the certificated LNG plant and storage facilities, prepared in the manner shown by Exhibits N and P, Schedule 1 of the application in this proceeding.

(H) Applicant shall file, in a form acceptable to the Commission, its Rate Schedule LNG for the natural gas service authorized herein.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge

VALLEY GAS TRANSMISSION, INC., DOCKET NO. CP65-280

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT, TERMINATING CERTIFICATES AND CANCELLING RELATED RATE SCHEDULES

(Issued July 26, 1965)

On March 10, 1965, Valley Gas Transmission, Inc. (Applicant), filed in Docket No. CP65-280 an application pursuant to Section 7(b) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities, all as more fully set forth in the application.

Applicant seeks permission and approval to abandon (1) approximately nine miles of 4-inch gathering line, nine miles of 6-inch gathering line, two miles of 5-inch well line and miscellaneous 2-inch well lines, together with certain compression, liquid extraction and related facilities running from the Refugio Field Area in Refugio County, Texas, to a point on the mainline of Tennessee Gas Transmission Company (Tennessee) also located in Refugio County, and (2) 2.76 miles of 6-inch gathering line and miscellaneous 2-inch line, together with appurtenant facilities, in the Pheasant Field, Matagorda County, Texas. Due to low pressure conditions in Refugio County and drainage conditions in the Pheasant Field, continued operation in the same manner as in the past and as required under existing contracts of the facilities proposed to be abandoned, is no longer economically feasible.

With the exception of three producers in the Refugio Field Area in Refugio County and the Pheasant Field Area in Matagorda County, all producers have agreed to cancel their contracts with the Applicant in this proceeding, and have filed applications for abandonment, which are being granted under separate order. The three producers referred to, made sales under authorizations and related rate schedules until late 1963 when deliveries from them to Applicant ceased. Since the Applicant has made an effort to contact the producers, Glen Humphrey, Jr., Humphrey Oil Corp., and J. R. Oribison, and sales of natural gas by said producers have ceased, their respective certificate authorizations should be terminated and their respective related rate schedules should be cancelled as hereinafter provided for.

After due notice, no petition to intervene, notice of intervention, or protest to the granting of the application has been filed.

At a hearing held on July 21, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought, and upon consideration of the record,

The Commission finds:

(1) Applicant, Valley Gas Transmission, Inc., a Texas corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of December 29, 1960, Docket No. G–19618 (25 FPC 233).

(2) The facilities proposed to be abandoned, as hereinbefore described and as more fully described in the application herein, are used in the transportation and sale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and such abandonment is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The proposed abandonment of the aforesaid facilities is permitted by the public convenience and necessity and approval thereof should be granted as hereinafter ordered.

(4) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act, and the public convenience and necessity require (1) that the certificates of public convenience and necessity issued to Glen Humphrey, Jr., in Docket No. CI63–703, Humphrey Oil Corp., in Docket No. CI63–706 and to J. R. Oribison in Docket No. CI63–1320 be terminated and (2) Glen Humphrey, Jr., Rate Schedule No. 2, Humphrey Oil Corp., Rate Schedule No. 1 and J. R. Oribison Rate Schedule No. 1 be cancelled as of the date of issuance of this order.

The Commission orders:

(A) Permission for and approval of the abandonment of the facilities hereinbefore described, as more fully described in the application in this proceeding, are hereby granted to Applicant, Valley Gas Transmission, Inc.

(B) Applicant shall advise the Commission of the date of abandonment of the facilities as authorized in paragraph (A) above within 10 days of such abandonment.

(C) The certificates of public convenience and necessity issued to Glen Humphrey, Jr., in Docket No. CI63–703, Humphrey Oil Corp., in Docket No. CI63–706, and to J. R. Oribison in Docket No. CI63–1320 are hereby terminated effective on the date of this order.

(D) The rate schedules of Glen Humphrey, Jr., Rate Schedule No. 2, Humphrey Oil Corp., Rate Schedule No. 1, and J. R. Oribison Rate Schedule No. 1 are hereby cancelled, effective on the date of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

KANSAS-NEBRASKA NATURAL GAS COMPANY, INC., COMPLAINANT v. COLORADO INTERSTATE GAS COMPANY, DEFENDANT, DOCKET NO. RP65–43

ORDER APPROVING SETTLEMENT AGREEMENT, ACCEPTING REVISED TARIFF SHEETS FOR FILING, AND TERMINATING PROCEEDING

(Issued July 27, 1965)

This proceeding was instituted by Commission order accompanying Opinion No. 450, issued February 18, 1965, 33 FPC 281, in Docket No. CP64–294, for the purpose of providing Kansas-Nebraska Natural Gas Company, Inc. (Kansas-Nebraska) with an opportunity to present evidence in support of its allegations of discriminatory rate treatment which it made in Docket No. CP64–294. In that

prior proceeding Colorado Interstate Gas Company (Colorado Interstate) was granted a certificate authorizing the construction of facilities and sale of gas to Cheyenne Light, Fuel & Power Company (Cheyenne). The sales authorized were to be made from Colorado Interstate's 12-inch, 40-mile lateral originally certified in 1963 (30 FPC 356) to serve Kansas-Nebraska in the 3-state area of northwestern Colorado.

A pre-hearing conference was convened before the Presiding Examiner on June 15, 1965, in this proceeding. Prepared testimony and exhibits were introduced into the record by Kansas-Nebraska, Colorado Interstate and the Commission staff. After brief opening statements, counsel for all parties requested a recess for negotiations, which were successful in reaching a compromise agreement. On June 16, 1965, counsel for Colorado Interstate read into the record a "Statement of Settlement" which had been agreed to by all parties who entered an appearance in hearing, including in addition to the aforementioned parties, Kansas-Colorado Utilities, Inc., Public Service Company of Colorado, Western Slope Gas Company, Cheyenne Light, Fuel & Power Company, Kansas Corporation Commission, and the Commission staff. The Presiding Examiner certified the record to the Commission for its consideration.

On June 16, 1965, Colorado Interstate tendered for filing as proposed changes in its FPC Gas Tariff, First Revised Volume No. 1, Original Sheet No. 11F, First Revised Sheet 11D, Second Revised Sheets Nos. 11C, 11E, 16A, and 16B, and Third Revised Sheet No. 11B. Copies thereof, together with copies of the settlement agreement, have been served upon all customers and interested State commissions. No protests or objections thereto have been received by the Commission.

Briefly stated, the settlement agreement provides:

(1) Colorado Interstate will submit for filing a new Rate Schedule PR–1, Partial Requirement Service, to be effective as of July 1, 1965, superseding Rate Schedule P–2. For comparative purposes, Appendix A hereto reflects the three major changes: (A) Availability; (B) Minimum Monthly Bill; (C) Minimum Annual Bill. The new PR rate schedule contains other minor and supplementary changes from those contained in P–2 rate schedule.

(2) The existing service agreement between Kansas-Nebraska and Colorado Interstate for sales under Rate Schedule P–2 shall be modified to include sales under Rate Schedule PR–1 and to include an additional delivery point for gas sold under PR–1 at an existing interconnection in the Hugoton Field in Kansas.

(3) Kansas-Nebraska withdraws its complaint herein and the Commission shall terminate this proceeding.

(4) The parties request that the Commission waive the requirements of applicable Regulations to effectuate the agreement.

(5) No party shall be bound by the agreement unless it is approved without modification, in its entirety, by the Commission.

(6) The parties shall not be considered as approving any principles of tariff construction by the agreement to the settlement terms.

The Commission finds:

(1) Good cause exists for waiving the 30-day requirements of Part 154 of the Commission's Regulations under the Natural Gas Act in order that the tariff sheets specified above may become effective as hereinafter ordered.

(2) The proposed Statement of Settlement and the tariff sheets tendered for filing on June 16, 1965, specifically mentioned above, are proper and in the public interest in carrying out the provisions of the Natural Gas Act, and should be accepted for filing and made effective as hereinafter provided and ordered.

The Commission orders:

(A) The 30-day notice requirement of Part 154 of the Commission's Regulations under the Natural Gas Act is hereby waived subject to the terms and conditions of this order and of the Statement of Settlement herein.

(B) The Statement of Settlement and the tariff sheets specifically described above are accepted for filing to become effective as of July 1, 1965, subject to the terms and conditions of this order; *provided, however,* that this order shall not be construed to change or otherwise affect the existing obligations of Colorado Interstate, including but not limited to those relating to refunds and rate reductions, which are not specifically changed, modified or terminated by the Statement of Settlement and the tariff sheets described above.

(C) Upon compliance by Colorado Interstate with each of the terms and conditions of the Statement of Settlement and of this order, this proceeding shall be terminated.

(D) This order is without prejudice to any findings or orders which have been made or may hereafter be made by the Commission and is without prejudice to any claims or contentions which may be made by the Commission, Colorado Interstate Gas Company, the Commission staff, or any other party affected by this order, in any proceedings now pending or hereafter instituted by or against Colorado Interstate Gas Company or any other persons or parties affected by this order.

APPENDIX A

MAJOR CHANGES PROPOSED BY CIG IN RATE SCHEDULE PR–1 [1] TO REFLECT SETTLEMENT OF ISSUES RAISED IN DOCKET NO. RP65–43

		Minimum monthly bill	Minimum annual bill	Billing demand
P–2	Limited to K–N at a point or points along Seller's 12" lateral Wyoming pipeline.	Monthly demand charge plus a minimum commodity charge based on *75 percent* use of the C.D. for each billing month.	Sum of monthly demand charges plus a minimum commodity charge based on *75 percent* use of the C.D. for the billing year.	Contract demand.
PR–1	Generally available to any pipeline company when such pipeline is receiving a substantial portion of its requirements from other sources.	Same as P–2 except the minimum commodity charge is based on *40 percent* use of the C.D.	Same as P–2 except the minimum commodity charge is based on *70 percent* use of the C.D.	No change from P–2.

[1] Supersedes the presently effective P–2 schedule. Rate Schedules P–2 and PR–1 contain the same rate levels as the P–1 schedule, $0.93 per Mcf demand charge and 18.5 cents per Mcf commodity charge.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CITY OF LORETTO, TENNESSEE AND TEXAS EASTERN TRANSMISSION CORPORATION, DOCKET NO. CP65–305

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued July 27, 1965)

On March 26, 1965, the City of Loretto, Tennessee (Applicant) filed in Docket No. CP65–305, an application, as supplemented, on May 18, 1965, pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Texas Eastern Transmission Corporation (Respondent) to establish physical

connection of its transmission facilities with the proposed facilities of and to sell natural gas to Applicant for resale and distribution in Loretto, all as more fully set forth in the application in this proceeding.

Applicant proposes to construct and operate approximately 1.2 miles of 4-inch transmission line from the proposed interconnection with Respondent in Lawrence County, Tennessee, to Loretto, together with the distribution facilities necessary to provide the subject service.

The application shows Applicant's estimated third year peak day and annual natural gas requirements to be 320 Mcf and 23,489 Mcf, respectively.

The total estimated cost of the proposed project, including transmission and distribution facilities, is $140,000, which cost will be financed by the issuance and sale of natural gas revenue and general obligation bonds. Exhibit N of the application shows that, based on a third year leveling of sales and expenses, net revenue covers debt service 1.56 times. This ratio satisfactorily indicates the feasibility of Applicant's proposal.

On April 28, 1965, Respondent filed an answer to the subject application stating that it will abide by the Commission's decision in this matter.

Due notice of the filing of the application and opportunity for hearing thereon has been given by publication in the Federal Register on April 13, 1965 (30 F.R. 4728). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

(1) Respondent, Texas Eastern Transmission Corporation, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of October 10, 1947, in Docket No. G–880 (6 FPC 148).

(2) Applicant, City of Loretto, Tennessee, is a municipal corporation incorporated under the laws of the State of Tennessee, and is legally empowered to construct and operate natural gas facilities and to sell and distribute natural gas in said city.

(3) It is necessary and desirable in the public interest that Respondent be directed to establish physical connection of its natural gas transmission system with the proposed facilities of Applicant and to sell and deliver up to 320 Mcf of natural gas per day to Applicant, as set forth in the application, as supplemented, and as hereinafter ordered and conditioned.

(4) This order should be conditioned upon Applicant being prepared to receive gas from Respondent, as proposed, within one year from the date on which this order issues and upon the execution of a service agreement between Applicant and Respondent in accordance with the Commission's Regulations under the Natural Gas Act.

(5) The requirement that Respondent serve Applicant, as proposed, will not place any undue burden upon Respondent nor impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) Respondent, Texas Eastern Transmission Corporation, is directed to establish physical connection of its natural gas transmission system with the proposed facilities of Applicant and to sell and deliver up to 320 Mcf of natural gas per day to Applicant, all as hereinbefore described and as set forth in the application, as supplemented, in this proceeding.

(B) This order is conditioned upon Applicant being prepared to receive natural gas from Respondent, as proposed, within one year from the date on which this order issues and upon the execution of a service agreement between

Applicant and Respondent in accordance with the Commission's Regulations under the Natural Gas Act.

(C) Respondent shall report to the Commission in writing the date of commencement of service to Applicant.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOUTH GEORGIA NATURAL GAS COMPANY, DOCKET NO. CP65-392

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 27, 1965)

On June 9, 1965, South Georgia Natural Gas Company (Applicant) filed in Docket No. CP65-392 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain facilities and the sale and delivery of natural gas to the City of Jasper, Florida, for resale and the delivery of natural gas, on an interruptible basis, to the Occidental Corporation of Florida (Occidental), all as more fully set forth in the application in this proceeding.

Specifically, Applicant proposes to construct and operate a total of 27 miles of pipeline ranging from three inches to six inches together with the necessary metering and regulating facilities and appurtenances. The proposed pipeline is to connect with Applicant's present system at a point approximately 10 miles north of the Florida Power Corporation's plant and extend in an easterly direction to the vicinity of Purvis Still, Florida, with a 3-inch lateral line from the proposed main line for service to Jasper. Occidental will receive deliveries at the terminus of the proposed new main line.

The estimated third year peak day and annual natural gas requirements for Jasper are 599 Mcf and 49,224 Mcf, respectively. Occidental is estimated to require 500,000 Mcf annually during the third year of operations. Occidental will utilize gas in phosphate mining operations and processing.

The total estimated cost of Applicant's proposed facilities is $546,000, which cost will be financed from cash on hand.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 21, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, South Georgia Natural Gas Company, a Georgia corporation having its principal place of business in Thomasville, Georgia, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of August 3, 1954, in Docket No. G-1915 (13 FPC 666).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the sale and/or transportation and delivery of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof and the proposed sale and/or transportation and delivery of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed sale and/or transportation and delivery of natural gas by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued authorizing Applicant, South Georgia Natural Gas Company, to construct and operate the proposed facilities and to sell and/or transport and deliver natural gas as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be constructed and placed in actual operation and the sale and/or transportation and delivery of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within eight months from the date on which this order issues.

(D) The certificate issued herein is granted on the express condition that the interruptible service authorized herein shall be curtailed or interrupted to the extent required to meet existing or future contracted maximum delivery obligations of Applicant for firm service to its customers.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

UNITED GAS PIPE LINE COMPANY, DOCKET NO. CP65-391

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 27, 1965)

On June 7, 1965, United Gas Pipe Line Company (Applicant) filed in Docket No. CP65-391 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of certain facilities and the transportation and delivery of natural gas, on a firm basis, to Louisiana Plywood Corporation (Plywood) for use by the latter in its new plant in Winn Parish, Louisiana, all as more fully set forth in the application in this proceeding.

Specifically, Applicant proposes to construct and operate approximately 1.9 miles of 2-inch pipeline extending from Applicant's 30-inch Refugio-Sterlington main line in Jackson Parish, Louisiana, to the delivery station in Winn Parish,

together with a positive meter station and appurtenances. Plywood will utilize natural gas in direct fired dryers, in boilers for producing steam for processing operations and in miscellaneous plant purposes.

Plywood's estimated third year maximum day and annual requirements are 1320 Mcf and 336,600 Mcf, respectively.

The total estimated cost of the proposed facilities is $41,581, which cost will be financed from current working funds.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 21, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, United Gas Pipe Line Company, a Delaware corporation having its principal place of business in Shreveport, Louisiana, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of January 20, 1942, in Docket No. G–216 (3 FPC 3).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation and delivery of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof and the proposed transportation and delivery of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed transportation and delivery of natural gas by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued authorizing Applicant, United Gas Pipe Line Company, to construct and operate the proposed facilities and to transport and deliver natural gas as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be constructed and placed in actual operation and the transportation and delivery of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within six months from the date on which this order issues.

(D) This certificate shall not entitle the industrial customer to whom firm deliveries are authorized herein to any priorities to additional gas for meeting any future increases in its requirements at the expense of firm resale customers desiring to acquire additional gas to meet any future increases in their requirements.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CODY GAS COMPANY, DOCKET NO. CP65-378; HUSKY PIPELINE COMPANY, DOCKET NO. CP65-379

DECLARATIONS OF EXEMPTION

(Issued July 28, 1965)

On May 28, 1965, Cody Gas Company (Cody) and Husky Pipeline Company (Husky) filed their respective applications for exemption of their facilities described below from the provisions of the Natural Gas Act, pursuant to Section 1(c) thereof.

Cody is a legal entity engaged in the transportation and distribution of natural gas in the State of Wyoming. A portion of the natural gas so transported and distributed by Cody is transported in interstate commerce subject to the jurisdiction of the Federal Power Commission.

The communities of Cody and Meeteetse and environs thereof, are served by a non-integrated transmission system of Cody, one segment of which extends north from Cody to a point of connection with Husky Pipeline Company, all in Park County, Wyoming.

Natural gas received by Cody for transportation and distribution through its said system is consumed ultimately within the State of Wyoming, and all of its said facilities are located within said State.

Husky's sole service consists of transporting gas for the account of Cody which Cody purchases at the tailgate of Husky Oil Company's Ralston Plant. The said plant processes casinghead gas produced from sources in Montana and Wyoming, and the sales by the oil company to its pipeline affiliate were certificated by order of the Commission issued July 23, 1965, in Docket No. CI65-1249. Husky's facilities consist of approximately 22 miles of 4½-inch transmission pipeline extending Southwest from the tailgate of the said plant to a point of connection with Cody's facilities north of Cody.

All natural gas received by Husky for transportation through its said system is received within the State of Wyoming and ultimately consumed within the State of Wyoming. Husky's facilities are all located within the State of Wyoming.

The Public Service Commission of Wyoming has certified to the Federal Power Commission that it has been and will be exercising regulatory jurisdiction over the rates, service and facilities of Cody and Husky.

Wherefore, the Commission declares, by reason of the foregoing:

Cody Gas Company and Husky Pipeline Company are exempt from the provisions of the Natural Gas Act, and the orders, rules and regulations of this Commission issued thereunder.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

EL PASO NATURAL GAS COMPANY, DOCKET NO. CP62-265

ORDER FURTHER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 28, 1965)

On July 1, 1965, El Paso Natural Gas Company (Applicant), filed in Docket No. CP62-265 an application to further amend the order of the Commission in Docket No. CP62-265 on May 16, 1963, 29 FPC 984, as amended on July 2, 1963, 30 FPC 16 and April 28, 1964, 31 FPC 1034, which authorized, among other things, the installation and operation of an 880 Hp reciprocating compressor unit at its Albany Compressor Station located in Linn County, Oregon, to be utilized in supplying the natural gas requirements of California-Pacific Utilities Company. The application to further amend seeks revision of the said order of the Commission so as to authorize the substitution of a 1040 Hp gas turbine-driven compressor unit in the place of the 880 Hp reciprocating compressor unit authorized for the Albany Compressor Station, all as more fully set forth in the application to amend.

Applicant states it has re-evaluated its horsepower requirements at the Albany Compressor Station, and decided to install one 1040 Hp gas turbine unit at a cost of $300,000, which would effect a saving on capital investment of $165,000, as well as additional operational savings.

California-Pacific Utilities Company under letter of July 8, 1965, advised the Commission it was in complete accord with an approves of the proposal of the Applicant to substitute the gas-turbine unit for the certificated reciprocating unit.

Due notice of the filing of the application to amend and opportunity for hearing thereon has been given by publication in the Federal Register on July 15, 1965 (30 F.R. 8920). No petition to intervene, notice of intervention, or protest to the granting of the application to amend has been filed.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the Commission's order issued May 16, 1963, as amended on July 2, 1963, and April 28, 1964, in Docket No. CP62-265, be amended as hereinafter ordered.

The Commission orders:

(A) The Commission's order issued May 16, 1963, as amended on July 2, 1963, and April 28, 1964, in Docket No. CP62-265, is amended so as to authorize El Paso Natural Gas Company to substitute a 1040 Hp gas turbine-driven compressor unit for the 880 Hp reciprocating compressor unit certificated in the said order of the Commission.

(B) In all other respects said order shall remain in full force and effect.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

NORTHERN STATES POWER COMPANY, DOCKET NO. E-7232

SUPPLEMENTAL ORDER AUTHORIZING THE ISSUANCE OF COMMON STOCK

(Issued July 28, 1965)

By order issued July 19, 1965, *supra*, p. 74, in the above-entitled matter, Northern States Power Company (Applicant), was authorized pursuant to Section 204 of the Federal Power Act to issue and sell 772,008 additional shares of its Common Stock subject to the provisions, among others, set forth in Paragraph (B) of that order as follows:

(B) The proposed issuance and sale of Common Stock in the manner set forth in the application shall not be consummated until:

(i) Applicant shall have amended its application pursuant to the requirements of Section 34.2(g) of the Commission's Regulations under the Federal Power Act relating to compliance with competitive bidding requirements, and Section 34.2(h)(1) of those Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegraph, as contemplated in Section 34.9 of the Regulations.

(ii) The Commission, by further order, shall have approved the price per share to be received by Applicant for the Common Stock and the amount of any compensation for underwriters to be paid by Applicant in connection with the Common Stock.

Applicant on July 26, 1965, filed an amendment, pursuant to the requirements of the aforementioned Commission order, in which it stated among other things, that it proposes to offer the Common Stock to the stockholders at a price of $33.00 per share. On July 28, 1965, Applicant filed an amendment, also pursuant to the requirements of the aforementioned Commission order, in which it stated that it proposes to accept as representing the lowest commitment fee, the bid of Blyth & Co., Inc., The First Boston Corporation, and Kuhn, Loeb & Co. Incorporated to receive $70,950 aggregate amount of compensation for commitment to purchase the Common Stock unsubscribed for by stockholders.

The Commission finds:

(1) Applicant has satisfactorily complied with the requirements contained in Paragraph (B) of the Commission's order issued July 19, 1965 in the above-entitled docket; the price per share to be received by the Applicant is reasonable, and the compensation to be paid to the underwriter under the bid Applicant proposes to accept for underwriting the proposed issuance of Common Stock is reasonable.

(2) The proposed issuance and sale of Common Stock as hereinafter authorized will be for a lawful object within the corporate purposes of Applicant and compatible with the public interest which is appropriate for and consistent with the proper performance of service by Applicant as a public utility and which will not impair its ability to perform that service and is reasonably appropriate for such purposes.

The Commission orders:

(A) The price per share to be received by Applicant for the proposed issuance of Common Stock and the compensation to be paid to the underwriter for underwriting the issuance of that Common Stock, under the respective bids referred to above, are approved as reasonable.

(B) The proposed issuance and sale of Common Stock referred to above, upon the terms and conditions, and for the purposes specified in the application, as supplemented by the amendment referred to above, and hereby authorized, subject only to the provisions of Paragraphs (C), (D) and (E) of the Commission's order issued July 19, 1965.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP65-381

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued July 28, 1965)

On May 28, 1965, Tennessee Gas Transmission Company (Applicant) filed in Docket No. CP65-381 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing it to render natural gas service to the Cities of New Albany and Pontotoc, Mississippi, under separate gas sales contracts, as more fully set forth in the application.

The cities have been served under one service agreement since 1951. They would have preferred to have been separate customers, but it was not economically feasible for each city to build a separate supply lateral to Applicant's main line. New Albany built a 30-mile lateral, and Pontotoc built an 18-mile extension from New Albany to Pontotoc.

In 1955 Applicant constructed its Kinder-Portland line which crossed the supply lateral of the cities between New Albany and Applicant's main line and relocated its meter station from the main line to the Kinder-Portland line. In 1963 Pontotoc constructed a separate three-mile supply lateral connecting the Kinder-Portland line to Pontotoc's existing facilities.

Pursuant to the request of the cities that they be treated as two separate customers, Applicant entered into separate gas sales contracts with each, allocating the authorized maximum daily quantity of 5,823 Mcf between the two contracts in accordance with the election of the cities. Such allocation resulted in 4,039 Mcf per day being assigned to New Albany and 1,784 Mcf per day being assigned to Pontotoc. The separate contracts were tendered to the Commission for filing on October 1, 1964, with a proposed effective date of November 1, 1964. The Commission, by letter dated October 28, 1964, rejected the separate contracts since no certificate authorization had been issued permitting separate deliveries to the two cities.

Neither construction of new facilities nor change in Applicant's operations is involved in the proposal.

The Cities of New Albany and Pontotoc, in a letter signed by the mayors of the cities, have indicated their support of the separate service.

Due notice of the filing of the application was published in the Federal Register on June 11, 1965 (30 F.R. 7627). No petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on July 27, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Tennessee Gas Transmission Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of July 15, 1947, in Docket No. G–910 (6 FPC 777).

(2) The proposed separate sales hereinbefore described, as more fully described in the application in this proceeding, are sales for resale in interstate commerce subject to the jurisdiction of the Commission and are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The separate sales of natural gas, as proposed in the application, are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate hereinafter issued and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3), and (e) of Section 157.20 of said Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Applicant, Tennessee Gas Transmission Company, authorizing the separate sales of natural gas, as hereinbefore described and as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are hereby conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c) (3) and (e) of Section 157.20 of such Regulations.

(C) The sales of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within six months from the date of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

ORDER DENYING APPLICATION FOR REHEARING

(Issued July 28, 1965)

On July 9, 1965, the Public Utilities Commission of the State of California, *et al.*, filed an application for rehearing of the Commission's Opinion No. 464, issued on June 10, 1965, 33 FPC 1228. Applicants contend the opinion erred in not imposing conditions that would make the certificates there issued subject to the Commission's final order in Docket No. R–200. This contention was considered and rejected in our opinion, and we reaffirm our conclusion that it is without merit. Therefore, the application for rehearing will be denied.

312–270—69——12

The Commission orders:

The application filed by the Public Utilities Commission of the State of California, *et al.*, on July 9, 1965, for rehearing of Opinion No. 464, issued herein on June 10, 1965, is denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

TOWN OF WEIR, MISSISSIPPI AND TEXAS EASTERN TRANSMISSION CORPORATION, DOCKET NO. CP65-375

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued July 28, 1965)

On May 27, 1965, the Town of Weir, Mississippi (Applicant) filed in Docket No. CP65-375 an application pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Texas Eastern Transmission Corporation (Respondent) to establish physical connection of its natural gas transmission facilities with the facilities proposed to be constructed by Applicant, and to sell and deliver natural gas to Applicant for resale and distribution in Weir, Mississippi and environs, all as more fully set forth in the application.

Applicant seeks physical connection of its proposed transmission facilities with Respondent's system at a point in Choctaw County, Mississippi, approximately one mile south of Applicant's town limits, and the sale and delivery of Applicant's estimated third year peak day requirements of 191 Mcf of natural gas at such connection.

Applicant's third year annual and peak day requirements are estimated to be 15,754 Mcf and 191 Mcf respectively.

Total estimated cost of Applicant's proposed construction, including transmission facilities and distribution system, is $95,000, and will be financed with proceeds from the issuance and sale of gas revenue bonds.

Third year revenues and expenses indicate that Applicant's debt service coverage ratio would be 1.69 and its proposal appears to be feasible.

On June 24, 1965, Respondent filed its answer herein, stating that it will abide by whatever decision the Commission may make on the merits of the application.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

The Commission finds:

(1) Texas Eastern Transmission Corporation, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of March 30, 1949, in Docket No. G-859, *et al.* (8 FPC 190).

(2) Applicant is legally authorized to construct and operate the proposed facilities and to engage in the local distribution of natural gas to the public, as proposed, within the meaning of Section 7(a) of the Natural Gas Act.

(3) It is necessary and desirable in the public interest that Respondent be directed to establish physical connection with Applicant's proposed facilities and to sell and deliver natural gas to Applicant, as proposed, upon the terms and conditions of this order.

(4) The requirement that Respondent serve Applicant, as hereinafter ordered, will not place any undue burden upon Respondent, require it to enlarge its trans-

portation facilities or impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) Respondent, Texas Eastern Transmission Corporation, is directed to establish physical connection of its facilities with the facilities proposed to be constructed and operated by Applicant, and to sell and deliver up to 191 Mcf of natural gas per day to Applicant, as hereinbefore described and as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) Respondent shall report to the Commission in writing the date of commencement of service to Applicant, within 10 days thereof.

(C) Applicant shall be prepared to receive service from Respondent as directed, within one year from the date on which this order issues.

(D) Respondent shall file, pursuant to part 154 of the Commission's Regulations under the Natural Gas Act, an executed service agreement with Applicant.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

WESTFIELD GAS CORPORATION AND PANHANDLE EASTERN PIPE LINE COMPANY, DOCKET NO. CP65-240

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued July 28, 1965)

On February 12, 1965, Westfield Gas Corporation (Applicant) filed in Docket No. CP65-240 an application pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Panhandle Eastern Pipe Line Company (Respondent) to establish physical connection of its natural gas transmission facilities with the facilities proposed to be constructed by Applicant, and to sell and deliver natural gas to Applicant for resale and distribution in Westfield, Indiana, all as more fully set forth in the application.

Applicant seeks physical connection of its proposed lateral transmission facilities with Respondent's main transmission line at a point in Hamilton County, Indiana, and the sale and delivery by Respondent to Applicant of the third-year maximum day requirements of Westfield of 397 Mcf of natural gas at such connection.

Applicant's estimated third year annual and peak day requirements are 40,741 Mcf and 397 Mcf, respectively.

Total estimated cost of Applicant's proposed construction, including transmission facilities and distribution system, is $140,000, and will be financed with a loan of $100,000 from the Merchants National Bank and Trust Company of Indianapolis, Indiana and with internally generated funds.

Respondent has filed no objection to the issuance by the Commission of an order as requested by Applicant.

Using the revenue, expense and income information supplied by Applicant, the calculated third year rate of return is 11.6 percent. This indicates the project is economically feasible.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

The Commission finds:

(1) Respondent, Panhandle Eastern Pipe Line Company, a Delaware corporation having its principal place of business in Kansas City, Missouri, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of October 17, 1945, in Docket No. G–254 (4 FPC 1081).

(2) Applicant is legally authorized to construct and operate the proposed facilities and to engage in the local distribution of natural gas to the public, as proposed, within the meaning of Section 7(a) of the Natural Gas Act.

(3) It is necessary and desirable in the public interest that Respondent be directed to establish physical connection with Applicant's proposed facilities and to sell and deliver natural gas to Applicant, as proposed, upon the terms and conditions of this order.

(4) The requirement that Respondent serve Applicant, as hereinafter ordered, will not place any undue burden upon Respondent, require it to enlarge its transportation facilities or impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) Respondent, Panhandle Eastern Pipe Line Company, is directed to establish physical connection of its facilities with the facilities proposed to be constructed and operated by Applicant, and to sell and deliver up to 397 Mcf of natural gas per day to Applicant, as hereinbefore described, as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) Respondent shall report to the Commission in writing the date of commencement of service to Applicant, within 10 days thereof.

(C) Applicant shall be prepared to receive service from Respondent, as directed herein, within one year from the date on which this order issues.

(D) Respondent shall file pursuant to Part 154 of the Commission's Regulations, an executed service agreement with Applicant.

OPINION NO. 467

CUMBERLAND NATURAL GAS COMPANY, INC., G–18740; TRUMAN DRAKE, G–18744; CREEK OIL COMPANY, INC., CI64–457; J. C. MILLER OIL COMPANY, INC., G–18743 AND CI64–1107

OPINION AND ORDER ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY, AND DENYING APPLICATION FOR ABANDONMENT

(Issued July 29, 1965)*

Syllabus

1. Natural Gas Act gives Commission no authority to place limits on deliveries of gas dedicated to interstate commerce to protect correlative rights of intrastate sellers on adjacent acreage, at least in absence of any evidence indicating such limitation would benefit interstate operations. P. 135; 142.
2. It is well established that dedication of reserves for sale in interstate commerce occurs at least as soon as deliveries commence and once service is begun, producer cannot terminate service without Commission approval. P. 136.

*Initial decision appears on p. 140.

3. Section 7(b) of the Gas Act provides only procedure available to producer [or any assignee] for consent to cease service; such procedure requires affirmative showing that abandonment is warranted. P. 136.
4. Record fails to support finding that available supply of natural gas underlying originally dedicated acreage is so depleted that continuance of service in interstate commerce is unwarranted. P. 137.
5. Fact that producer's percentage interest in subject acreage was a minor one did not serve to remove such interest from encompassing effects of act of dedication. P. 137.
6. Producer's interest in acreage was effectively dedicated irrespective of fact that at time of dedication gas reserves in such area may have been unproven and were never connected to buyer's facilities. P. 137.
7. Commission finds application for abandonment should be denied for want of prosecution by producer-applicant and lack of assignee's satisfactory showing on merits—neither party has satisfied statutory requirements of Section 7(b). P. 137.
8. It would be violative of purpose of Section 7(b) of Gas Act to permit producer-applicant to accomplish by non-action under Section 7(c) that which it could not establish under Section 7(b). P. 138.
9. In a proceeding under Sections 7(c) and 7(b) of the Natural Gas Act, Commission *issues* certificates of public convenience and necessity and *denies* application for abandonment.

Commissioner O'Connor *concurring.*

W. D. Bratcher for Cumberland Natural Gas Company, Inc. and Har-Ken Oil Co.

William R. Connole and *Howard S. Spering* for Tartan Oil Co. and J. C. Miller Oil Company, Inc.

Harold M. Streets for Creek Oil Company, Inc.

George P. Lewnes for the Staff of the Federal Power Commission.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

Ross, *Commissioner:*

This is a certificate proceeding under Section 7 of the Natural Gas Act involving: (a) the application of Cumberland Natural Gas Company, Inc. (Cumberland) for authorization to gather and sell gas to Texas Gas Transmission Corporation (Texas Gas); (b) the applications of J. C. Miller Oil Company, Inc. (Miller), Truman Drake (Drake), and the Creek Oil Company, Inc. (Creek), for authorization to sell gas to Cumberland; and (c) the subsequent application of Miller for authorization to abandon its sales to Cumberland. The Commission granted temporary authorizations for the proposed sales. On November 10, 1964, an initial decision was issued by Examiner Robert M. Weston who granted permanent certificates to Cumberland and Creek, dismissed the applications of Drake and of Miller for want of prosecution, and denied Miller's application for abandonment. This case is before the Commission on exceptions filed on December 30, 1964, by the staff and by Tartan Oil Company (Tartan), an intervener in the Creek-Cumberland dockets.

Tartan filed a motion for oral argument which was objected to by Cumberland and by Creek. The issues in this proceeding have been so thoroughly considered in the briefs submitted by the participants that, in our judgment, oral argument would contribute little which has not already been presented. The motion for oral argument will be denied.

Factual and Procedural Background

On June 8, 1959, Cumberland, a pipeline gathering system in western Kentucky, applied in Docket No. G–18740 for authorization to gather and sell gas to Texas Gas at the rate of 21 cents per Mcf (at 15.025 psia). This consisted of a 15 cent base plus 6 cents for gathering, compressing, and transporting. Concurrently, two independent producers, Drake in Docket No. G–18744, and Miller in Docket No. G–18743, applied to sell gas to Cumberland at an initial rate of 10 cents per Mcf (at 15.025 psia), to be increased to 15 cents per Mcf after Cumberland had amortized certain gathering facilities. We granted temporary authorization in 1959. In 1963, Creek, another independent producer, applied in Docket No. CI64–457 to sell gas to Cumberland at 15 cents per Mcf, and received temporary authorization on April 2, 1964. Cumberland's facilities were connected to the wells of Miller and Creek, and gas from these wells has flowed into Cumberland's systems. Drake took no action under his authorization.

Miller contracted with Cumberland to dedicate some 9,000 acres in the Harps Hill Area of Kentucky to interstate service, and began delivering gas to Cumberland from two wells in this area in 1959. Miller sold 150,000 Mcf to Cumberland, but ceased deliveries after November 1961 because of water accumulation in its wells. These wells are not, however, fully depleted, and Cumberland has estimated that approximately 7 billion cubic feet of recoverable reserves remain in Miller's dedicated acreage. On March 18, 1964, Miller applied in Docket No. CI64–1107 to abandon all service authorized in Docket No. G–18743, alleging depletion.

On July 14, 1964, the Har-Ken Oil Company, Inc. (Har-Ken) applied for succession in interest to Miller's application in Docket No. G–18743, stating that Miller had assigned to Har-Ken its rights to certain acreage in the Harps Hill properties, including its two wells. We recognized this assignment as a "partial succession", and we permanently certificated Har-Ken in Docket No. CI65–139, deleting Har-Ken's acreage from Miller authorization. See *Humble Oil & Refining Company, et al.*, Docket No. G–3072, *et al.*, October 7, 1964.

Also, on July 14, 1964, Tartan filed a Notice of Substitution for Miller in the abandonment proceeding, stating that Miller had assigned to it Miller's leasehold rights in 80.5 acres in the "Collier Unit" of the dedicated Harps Hill Area. This acreage did not include the two wells assigned to Har-Ken. Tartan drilled a well capable of commercial production on the "Collier Unit" in the summer of 1963, but did not connect this well to Cumberland, nor has it indicated any intent to continue sales to Cumberland from the 80.5 acres.

Tartan had petitioned on November 14, 1963, to intervene in the Creek-Cumberland proceedings, alleging that it produced gas from the same field as Creek, and that it would be damaged because of excessive drainage by Creek. We denied this petition on April 2, 1964, 31 FPC 763. Tartan petitioned for reconsideration, and on June 1, 1964, 31 FPC 1329, we granted intervention finding that Tartan might provide useful information regarding the "overall nature of Cumberland's activities." We also granted a petition by Cumberland to intervene in the Miller abandonment proceedings, and consolidated the above matters for hearing.

Hearings were held at Washington, D.C., between July 13 and July 30, 1964, and were concluded on the latter date. The Examiner permitted Tartan to present evidence in support of Miller's abandonment application conditioned on our grant of Tartan's request for substitution. We denied such request on August 26, 1964, and the Examiner accordingly gave no consideration to Tartan's showing in support of the abandonment.

The Examiner's Initial Decision

On November 10, 1964, the Examiner issued an initial decision proposing the grant of permanent certificates to Cumberland and to Creek, subject to the finding that Cumberland qualified as a Class D natural-gas pipeline company, and that Cumberland's rates to Texas Gas should not at any time exceed 6 cents per Mcf at 15.025 psia plus any rate lawfully in effect for the sale of gas to Cumberland by producers of natural gas in the area of Cumberland's operations including any rate applicable to Cumberland's own production.

The Examiner dismissed for want of prosecution Drake's application in Docket No. G–18744, and Miller's application in Docket No. G–18743 to the extent that the latter was not disposed of by Commission action in the Har-Ken proceeding, Docket No. CI65–139, and in the Miller abandonment proceeding, Docket No. CI64–1107. The Examiner also denied the Miller abandonment proceeding for want of prosecution.

In connection with Creek's application in Docket No. CI64–457, the Examiner approved Creek's price for the sale of gas to Cumberland at a flat 15 cents per Mcf at wellhead,[1] and rejected Tartan's request that Creek's certification be limited to a temporary authorization and a restricted production stating that the "Commission has never asserted jurisdiction to decide conflicting claims to gas in place, or how such gas should be allocated between claimants." The Examiner further observed that Tartan's allegations that Creek's rate of production would impair the value of Tartan's reserves, although backed by expert authority, were refuted by equally expert testimony, and he determined that on balance Tartan's charges were not proved.

Issues Raised by Exceptions to the Examiner's Decision

Two basic issues are presented in the exceptions to the Examiner's decision filed by Tartan and by the staff. First, Tartan asserts that the Examiner is in error because of his refusal to limit Creek's certification to a temporary authorization and to restrict production on the basis of Tartan's allegations of drainage and waste. Second, the staff contends that clarification is required with respect to the Examiner's dismissal of Miller's application in Docket No. G–18743 for want of prosecution, since the apparent effect of this dismissal is to accord Miller the very relief which it sought and was denied in its abandonment proceeding.

We find no merit in Tartan's exception to the Examiner's refusal to impose a restrictive limitation upon Creek's production. The record in this matter shows that Tartan's deliveries and sales of gas from the White Plains North Gas Field, where its wells are adjacent to those of Creek, are solely in intrastate commerce, and hence are plainly beyond the Commission's jurisdiction by operation of Section 1(b) of the Natural Gas Act, 15 U.S.C. § 717(b). See also *Federal Power Commission* v. *Transcontinental Gas Pipe Line Corp.*, 365 U.S. 1, 17 (1961). Without passing on the extent of our jurisdiction, if any, in a situation where there is no state conservation law and where an interstate producer is being drained by one selling in interstate or in intrastate commerce, it is clear that the Natural Gas Act gives us no authority to place limits on deliveries of gas dedicated to interstate commerce in order to protect the correlative rights of intrastate sellers on adjacent acreage at least, in the absence of any evidence indicating that such a limitation would benefit interstate operations. It would be anomalous to impose a restriction upon production by Creek for sales in inter-

[1] The Examiner found that Creek's price was not excessive in view of a staff-prepared summary of all of the 101 producer contracts in Kentucky which have been certificated, showing that of 99 permanent certifications, 82 are at prices over 15 cents per Mcf, and 23 are at prices of 20 cents or above.

state commerce where neither we nor the conservation authority of the State of Kentucky could impose a like restriction on production by Tartan for sales in intrastate commerce. The *Northern Natural Gas Company* case [2] cited by Tartan in support of its position is inapposite, for that case involved a situation where state conservation regulations conflicted with sales of gas in interstate commerce.

It is therefore unnecessary to rule specifically on the question as to whether Tartan's request for a restriction on Creek's production is also barred by that language in Section 1(b) of the Natural Gas Act which states that the provisions of the Act shall not apply to the "production or gathering of natural gas."

With respect to the second basic issue involving the Examiner's action in dismissing Miller's application in Docket No. G–18743, we find the staff's request for clarification to be appropriate. The authorization granted Miller by the Commission's action of July 2, 1959, carried with it the following requirement:

> * * * once service is commenced under this authorization it may not be discontinued without permission of the Commission issued pursuant to the provisions of the Natural Gas Act.

Acting under this authorization, Miller commenced deliveries of gas to Cumberland from two producing wells in the Harps Hill Area of Muhlenberg County pursuant to a contract in which Miller dedicated for sale in interstate commerce "all gas reserves on the leases under the Seller's [Miller's] control * * * where it is economically feasible to collect or transport the gas." Miller's leases in the Harps Hill Area encompassed approximately 9,000 acres of property and included the two tracks containing recoverable reserves of gas which Miller subsequently assigned to Har-Ken and to Tartan.

The principle is well established that dedication of reserves for sale in interstate commerce occurs at least as soon as deliveries commence, and that once such service is begun, the producer cannot terminate the service without Commission approval. *Atlantic Refining Co.* v. *Public Service Commission of New York*, 360 U.S. 378, 387–389 (1959); *Sunray Mid-Continent Oil Co.* v. *Federal Power Commission*, 364 U.S. 137, 156 (1960). It is thus plain that in this instance Miller assumed the continuing duty to deliver for sale in interstate commerce the gas from its 9,000 dedicated acres until it exhausted its reserves or received Commission permission to cease service. See *Hunt* v. *Federal Power Commission*, 306 F. 2d 334 (CA5-1962); *cf.*, *Sunray Mid-Continent Oil Co.* v. *Federal Power Commission, supra; Sun Oil Co.* v. *Federal Power Commission*, 364 U.S. 170 (1960).

The fact that Tartan had succeeded as an assignee to Miller's interest in 80.5 acres in the Collier Unit was adequately established in the course of the hearing. In retrospect, we should have permitted Tartan to be joined as a party to this application and shall so provide herein. Granting Tartan's request at this time is not prejudicial because the Examiner permitted it to introduce all relevant evidence on this issue during the hearing.

The only procedure available to Miller (and to any assignee of Miller) for obtaining Commission consent to cease service was by application for authorization to abandon in accordance with the provisions of Section 7(b) of the Natural Gas Act, 15 U.S.C. §717(b). This section provides that no natural-gas company shall abandon all or any portion of its facilities subject to the Commission's jurisdiction or service rendered by means of such facilities without the Commission's approval after due hearing and a finding that the available supply of natural gas is depleted to the extent that the continuance of service is unwarranted, or that the present or future public convenience or necessity permit the abandonment. This procedure plainly required of Miller an affirmative

[2] *Northern Natural Gas Company* v. *State Corporation Commission of Kansas*, 372 U.S. 84 (1963).

showing that abandonment was warranted. The importance of this showing was recognized in *Michigan Consolidated Gas Co.* v. *Federal Power Commission*, 283 F. 2d 204, 214, 180, U.S. App. D.C. 409, 419 (1960), cert. denied, 364 U.S. 913, where the Court stated:

> * * * An applicant for abandonment under § 7(b) of the Act has the burden of making the factual showing which will assure the Commission charged with protecting the public interest, that that interest will in no way be disserved; just as the applicant under § 7(c) for a certificate to commence service must bear the burden of proving that that public interest will be served.

Miller and Tartan failed to make the required statutory showing. The record fails to support a finding that the available supply of natural gas underlying the acreage originally dedicated to interstate commerce is so depleted that the continuance of service in interstate commerce is unwarranted. The acreage assigned by Miller to Har-Ken contains two wells in the "Harps Hill Gas Field" which Har-Ken intends to maintain in production under contract with Cumberland, and for the operation of which Har-Ken has been certificated in Docket No. G–3072, *et al.* The dedicated acreage assigned by Miller to Tartan contains one well which Tartan admits is capable of commercial production, with an open flow rate of three million cubic feet per day, and the record shows that Tartan has constructed a line to this well with the intent of transporting and selling production therefrom in an intrastate market.

Unable to establish the depletion of the dedicated acreage, Miller attempted to argue that its percentage interest in the 80.5 acres was so small that it had never accomplished an effective dedication of this plot. This argument, however, is plainly without merit. The fact that Miller's interest in the 80.5 acres was a minor one did not serve to remove such interest from the encompassing effects of the act of dedication. See *Deep South Oil Company of Texas, et al.*, 14 FPC 83, 87 (1955); *cf. Valvoline Oil Co.* v. *United States*, 308 U.S. 141, 147 (1939); *Jersey Central Power & Light Co.* v. *Federal Power Commission*, 319 U.S. 61 (1943). Moreover, Miller's interest in these 80.5 acres was effectively dedicated irrespective of the fact that at the time of dedication the gas reserves in such acreage may have been unproven, and were never connected to Cumberland's facilities. *Phillips Petroleum Company, et al.* (Docket No. G–11990), 23 FPC 260, 263 (1960).

Tartan on its part conceded that Miller's act of dedication covered its 80.5 acres, and rested its argument on the contention that the output of its one well was so small in relationship to the demands of Texas Gas Transmission Corporation, and Tartan's percentage interest in this output in turn was so small, that abandonment in this case would not impair the present or future public convenience or necessity. Tartan's position thus resolves itself into an argument of "de minimis." However, the fact that an operation may be small does not suffice to remove such operation from our jurisdiction. *Deep South Oil Company of Texas, et al.*, 14 FPC 83, 87 (1955). Were we to accept Tartan's argument all but a few very large sales could be abandoned whenever it suited the interests of the producer since the particular sale could be only a small part of the pipeline's gas supply.

We accordingly find that Miller's application for abandonment should be denied, not only for want of adequate prosecution on Miller's part, but also for lack of a satisfactory showing on the merits as presented by Tartan. Neither party has satisfied the statutory requirements of Section 7(b) of the Act.

Our denial of Miller's abandonment applications certainly is not to be frustrated by Miller's failure to prosecute its application for permanent certifica-

tion in Docket No. G–18743. While we find no basis for holding, as the staff suggested, that permanent certification should be granted, neither do we find any basis for relieving Miller (except as we have already done so by our certification of Har-Ken in Docket No. G–3072, *et al.*) of the responsibilities assumed by it under its temporary authorization. It indeed would be violative of the purpose of Section 7(b) of the Natural Gas Act to permit Miller to accomplish by non-action under Section 7(c) that which it could not establish under Section 7(b). Accordingly, the Examiner's ordering paragraph (F) will be modified to avoid any inconsistency with his order denying the abandonment application of Miller. Miller's temporary authorization will remain in effect and will continue to apply to the acreage it dedicated, and to be binding upon any person taking Miller's present interest by assignment. Of course, Tartan may file a certificate application to succeed to Miller's interest in the 80.5 acres and assume Miller's obligation to deliver gas produced from this acreage to Cumberland or to another purchaser if it can make the showing required by Section 7(b) of the Natural Gas Act.

Of the thirty-nine exceptions filed by Tartan approximately one-half relate in one way or another to the Examiner's refusal to limit Creek's production, and are disposed of by our discussion concerning that point. We find that the other exceptions do not present any major issues, and consist for the most part of assertions that the Examiner committed certain procedural errors, that he was in error in not finding that Cumberland and Creek had each failed to meet the burden of proof for obtaining permanent certification, and that he was in error in finding that there was no evidence in the record to support Miller's application to abandon service. We have considered Tartan's exceptions in light of the facts of record and the pleadings of the parties, and we find no basis in these exceptions for reversing or modifying the findings and conclusions of the Examiner, other than to the extent that we have considered Tartan's evidence in support of Miller's application for abandonment, and have found it to be inadequate.

The record in this matter amply supports the Examiner's findings that Cumberland and Creek each adequately met the burden of proof required of them for certification. Insofar as both the Cumberland and the Creek applications are concerned, we approve and adopt the Examiner's findings and conclusions as to the qualifications of these applicants, the financial, engineering, and economic data submitted in support of their applications, and the rates approved for the sale of gas together with the conditions imposed on the certificates.

The Commission finds:

(1) The following applicants, Cumberland Natural Gas Company, Inc. (Docket No. G–18740), and Creek Oil Company, Inc. (Docket No. G–18744), are engaged in the sale of natural gas in interstate commerce for ultimate public consumption and each is, therefore, a "natural-gas company" within the meaning of the Natural Gas Act.

(2) The sales of natural gas hereinbefore described, as more fully described in the applications, are or will be made in interstate commerce, subject to the jurisdiction of the Commission, and such sales, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Subject to the requirements of our order herein and conditions attached to the certificates herein issued, the Cumberland Natural Gas Company, Inc., and the Creek Oil Company, Inc., are able and willing properly to do the acts and to perform the services proposed, and to conform to the provisions of the

Natural Gas Act and the requirements, rules, and regulations of the Commission thereunder.

(4) The sales of natural gas by the Cumberland Natural Gas Company, Inc., and by the Creek Oil Company, Inc., together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, are and have been required by the public convenience and necessity, and certificates therefor should be issued as hereinafter ordered and conditioned.

(5) The conditions attached to the certificates herein issued are required by the public convenience and necessity.

(6) The J. C. Miller Oil Company, Inc., and its assignee, Tartan Oil Company, have failed to make the showing required under Section 7(b) of the Natural Gas Act to warrant the grant of Miller's application for authorization to abandon all or any portion of its facilities subject to the jurisdiction of the Commission, or any service rendered by means of such facilities.

(7) Except as herein granted, the exceptions to the Examiner's decision should be denied.

The Commission orders:

(A) A certificate of public convenience and necessity is hereby issued to Cumberland Natural Gas Company, Inc., for the operations and sales as hereinbefore described and as more fully described in its application, supplementary filings, and the record herein, subject to the conditions hereinafter set forth.

(B) Cumberland Natural Gas Company, Inc., is a Class D natural-gas pipeline company within the meaning of the Commission's Regulations under the Natural Gas Act and Uniform System of Accounts, and shall keep the accounts and make the filings appropriate to its classification.

(C) The certificate issued to Cumberland Natural Gas Company, Inc., is conditioned to require that its rate for sales to Texas Gas Transmission Corporation shall not at any time exceed the sum of 6 cents per Mcf at 15.025 psia plus any rate lawfully in effect for the sale of gas to said Cumberland by producers of natural gas in the area of Cumberland's operations, including any rate applicable to Cumberland's own production, if any.

(D) The application of Truman Drake (Docket No. G–18744) is hereby dismissed for want of prosecution.

(E) A certificate of public convenience and necessity is hereby issued to Creek Oil Company, Inc., for the sale hereinbefore described and as more fully described in its application and the record herein.

(F) The Commission's letter-order of August 26, 1964, is modified to make Tartan a party to the abandonment application in Docket No. CI64–1107.

(G) To the extent that the application of J. C. Miller Oil Company, Inc., for a certificate of public convenience and necessity (Docket No. G–18743) has not been disposed of by Commission action in Docket No. CI65–139, no change is made in the temporary authorization granted this applicant by the Commission's order of July 2, 1959.

(H) The abandonment application of J. C. Miller Oil Company, Inc. (Docket No. CI64–1107), is hereby denied.

(I) The certificates issued in paragraphs (A) and (E) are not transferable, and shall be effective only so long as applicants continue the acts or operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(J) The issuance of the certificates in paragraphs (A) and (E) shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or of Part 154 or Part 157 of the Commission's Regulations thereunder, and is without prejudice to any findings or orders which have been or may hereafter be

made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants. Further, our action in this proceeding shall not foreclose or prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved, except as specified in paragraph (C) hereof. Nor shall the issuance of such certificates imply approval of all of the terms of the respective contracts basing the operations and sales herein certificated.

(K) The Examiner's decision, to the extent not inconsistent herewith, is hereby adopted as part of this Opinion and Order.

(L) Except as herein granted, the exceptions to the Examiner's decision are hereby denied.

(M) The motion for opportunity to present oral argument before the Commission is denied.

Commissioner O'Connor *concurring.*

O'CONNOR, *Commissioner, concurring:*

While concurring fully in the disposition of this proceeding, I cannot lend my approval to the *obiter dictum* in the majority opinion which would, first, seek to affirm a "well-established rule", but would, second, proceed to reopen that rule for further litigation. The reopened issue is the event by which reserves are dedicated to interstate commerce, and the well-established rule is the moment at which gas begins to flow. See *e.g.*, *Continental Oil Co.*, 31 FPC 1079 (1964); *J. M. Huber Corp.* v. *F.P.C.*, 236 F. 2d 550 (3d Cir. 1956), cert. den. 352 U.S. 971 (1957). Although my colleagues are willing to admit this, they would prefer that prior events also justify federal control. Such earlier events would include accepting a certificate, filing a certificate, or even negotiating a contract for an interstate sale. The thrust of the main opinion is to depart from the flow of gas as the accepted measure of our jurisdiction for the purpose of indicating a willingness to assert control over formative intentions of an applicant. Not only does this cloud a firm jurisdictional test and proceed to enter a wilderness of indefinable intent; it is a comment totally removed from the facts before us.

INITIAL DECISION
OF THE PRESIDING EXAMINER ON APPLICATIONS UNDER SECTION 7
OF THE NATURAL GAS ACT

(Issued November 10, 1964)

WESTON, *Presiding Examiner:* Cumberland Natural Gas Company, Inc. is a pipeline gathering system connecting several producing fields located in western Kentucky, and sells the gathered gas to Texas Gas Transmission Corporation at a point near Nortonville, Kentucky. It has been operating under temporary authorization issued July 2, 1959; it here seeks permanent certification.

Truman Drake is an independent producer who dedicated putative reserves in the Apex area of Christian County by contract with Cumberland. The area is still under study as to gas reserve potential, and has not been connected to the Cumberland system. Drake received a temporary authorization to sell gas to Cumberland on June 3, 1959, but no action has been taken thereunder. Drake has failed to appear or prosecute his application for permanent certification; Staff therefore moves that the application be dismissed, and the motion clearly must be granted.

Creek Oil Company, Inc. is an independent producer which, so far as is presently pertinent, operates one well in the White Plains North field of Hopkins and Muhlenberg Counties. On April 2, 1964, it was temporarily authorized to sell gas

to Cumberland, and the latter was likewise authorized to, and thereafter did, connect Creek's well to its system. Creek here seeks permanent certification.

J. C. Miller Oil Company, Inc. is an independent producer which owned, *inter alia*, properties in the Harps Hill area of Muhlenberg County and in the Collier Unit adjacent to the White Plains North field. It was temporarily authorized to sell gas to Cumberland, and the latter was likewise authorized to connect the gas, on July 2, 1959. Thereafter, Cumberland connected two Miller wells in the Harps Hill area, and deliveries of a total of about 150,000 Mcf of gas were made up to November, 1961. At that time, water accumulation in the wells made further deliveries impossible. Docket No. G–18743 is Miller's application for permanent certification. Docket No. CI64–1107 is Miller's application to abandon service filed March 18, 1964. The latter application is principally based on depletion of the "only wells" on the dedicated acreage "from which Cumberland has ever taken any gas deliveries."

It appears that Miller has disposed of the Harps Hill property and the Collier Unit property—that part of the originally dedicated acreage actually in Miller's control in which production potential is believed to exist. The disposition was by two assignments, next detailed.

1. On July 7, 1964, Miller assigned, *inter alia*, the Harps Hill gas well properties to the Har-Ken Oil Company of Owensboro, Kentucky. The assignment, designated a "partial succession," was recognized by the Commission in Docket No. CI65–139, on October 7, 1964, with the specific order that—

> * * * (F) The temporary certificate heretofore issued in Docket No. G–18743 is hereby amended by deleting therefrom authorization granted herein, in Docket No. CI65–139. ("Humble Oil & Refining Company and other applicants listed herein", Docket No. G–3072, *et al.*)

2. It appears that on April 29, 1963 Miller assigned approximately 80.5 of the dedicated acres to Tartan Oil Company. These acres lie east by north of the White Plains North field. On July 14, 1964, Tartan filed herein a notice of substitution of itself for Miller, asking that it "be recognized in these proceedings as standing in the place and stead of J. C. Miller Oil Company, Inc., as a beneficial party in interest", with regard to its 80.5 acres, insofar as the Miller abandonment application is concerned, and in recognition of the "very recent" assignment to Har-Ken, "a party whose interests * * * may lead it to seek to withdraw in part the Application for Authorization to Abandon Service."

By letter-order of August 26, 1964, the Commission rejected Tartan's request for substitution in the abandonment application, Docket No. CI64–1107; consequently, Tartan has no standing to pursue its desire for abandonment in the proceedings at bar, and will presumably be heard thereon at a later time.[1]

Tartan's main interest herein arises from its position as an intervenor in the Cumberland and Creek applications. Tartan says that "the most that the Commission should grant to these Applicants at this time is permission to continue operation on a restricted and controlled basis under their temporary authorizations with production and deliveries from the Creek lease restricted to not more than 10% of the daily open flow rate of its well or wells in any month," with reporting and other requirements imposed on both applicants. (Br. 68–71). The gravamen of Tartan's complaint is drainage and waste.

Drainage and Waste. As heretofore indicated, Creek operates one producing well, located approximately in the center of the White Plains North field, connected by one mile of 4 inch pipe with Cumberland's line to the north, and flowing

[1] The letter-order discloses that Tartan has not filed for Commission recognition of Tartan's succession to its part of the dedicated acreage covered by the temporary authorization of July 2, 1959 in Docket No. G–18743.

gas ultimately to Texas Gas in interstate commerce. The rest of the field is operated by Tartan, which has connected some 15 gas wells to its Jobe pipeline, and flows gas to Western Kentucky Gas Company in intrastate commerce. All or substantially all of such flow from Tartan occurs during the Kentucky heating season, beginning in September and ending in April of each year. Creek on the other hand, supplies large volumes of gas to Texas Gas during the summer months.

The testimony as to the degree of continuity and unity of the White Plains North field is in conflict. There is no doubt that there is some degree of continuity; there has been no attempt to establish that Creek's production derives from a reservoir wholly separated from the reservoir tapped by Tartan. For present purposes it may be assumed that the Creek well and the Tartan wells draw from a single reservoir, as depicted on the sketch (Appendix A) which is part of the decision. For present purposes, the following additional facts may be taken as established:

1. Tartan drilled the discovery well (#3 on the sketch) in July, 1962, and drilled three other wells (#6, #1, #2) prior to Creeks completion of its well December 7, 1962.

2. Tartan now has nine producing wells in the field. The field contains an estimated 8 million Mcf of producible gas, of which about 5 to 7 percent underlie Creek's acreage and about 90 to 92 percent underlie Tartan's acreage. (One to three percent of the reserves underlie well #12, not connected, and that portion of the field which extends into the Pitman unit shown at the right of the sketch.)

3. Tartan commenced deliveries to Western Kentucky Gas Company in October, 1963, and had produced a total of some 680,000 Mcf as of the end of May, 1964, by which time Western Kentucky had *pro tem* ceased taking deliveries because of the end of the heating season in April.

4. Creek commenced deliveries to Cumberland April 6, 1964, and through June 30, 1964 had produced 171,474 Mcf; a daily average of 1,994 (approximately 2,000) Mcf per day. At that rate, Creek's production as of September 15, 1964 (when Cumberland's production would recommence) would approximate 325,000 Mcf in 5½ months, compared to Tartan's production of 680,000 Mcf in eleven months.

5. At that rate, Tartan, as of September 15, 1964, had suffered drainage to the extent of about 245,000 Mcf, for (at 21¢ per Mcf) a loss of $51,000. Further estimates based on slightly different assumptions as to yearly comparative production indicate drainage at the rate of 1,150–1,380 Mcf per day, or $241–$290 per day; and drainage at exhaustion of the field of some 2,640,000 Mcf for a loss of $554,400.

Legal Analysis. Tartan's basic premise is that the Commission has "recognized" its jurisdiction over drainage by providing for the issuance of temporary certificates in drainage cases; therefore the Commission "cannot ignore" the injury done to Tartan's interests by the drainage taken as established in this case. (Br. 54; Regulations Sec. 157.28(c).) The premise is too broad and the conclusion does not follow.

The Commission has never asserted jurisdiction to decide conflicting claims to gas in place, or how such gas should be allocated between claimants. The Commission does not unitize fields or control rates of production. Quite clearly these are matters of the "production or gathering of natural gas" proscribed from Commission jurisdiction by Section 1(b) of the Natural Gas Act. The Commission, in issuing temporary certificates because of drainage, does not expressly or by implication determine who is entitled to the gas in law or equity—this is a matter of local law.

Assuming without deciding that "waste or loss of production gas from the White Plains North field must be expected to result from production by Creek from its well being consistently maintained on production" at present levels (Tartan Br. 56–57), this fact forms no basis for Commission intervention. The evidence shows that the waste, if it occurs, will be caused by water intrusion and the coning of sands at the bottoms of the gas wells, and will occur even before the "physical acts of draining the gas from the earth and preparing it for the first stages of distribution," which in turn are the preliminary acts of "production" and "gathering" exempted from regulation under the Act. See *Northern Natural Gas Co.* v. *State Corporation Commission of Kansas*, 372 U.S. 84, 90.[2]

Tartan argues that the Creek-Cumberland contract restricts Creek's "daily Contract Quantity" to the lesser of (a) 1,500 Mcf or (b) 10 percent of open flow capacity. The evidence shows that at most, 10 percent of open flow would amount to 730 Mcf per day, against actual deliveries of about 2,000 Mcf per day. Tartan attempts to bring this contract question within the competence of the Commission by showing that Creek's temporary certificate authorizes the producer to "render the sales proposed in its application"; the application, of course, is in pertinent part entirely based on the contract.

The short answer to this argument is, that the provision concerning "Contract Quantity" is conventionally and in this case a restriction on Cumberland's power to draw, and not on Creek's power to send, the gas from the well head. The language of the temporary certificate does not forbid Creek from producing and selling whatever quantities it desires above the Contract Quantity, or Cumberland from buying and taking such overages. It is hard to envisage any case in which such an issue would involve the interests of consumers; certainly there is no such involvement in the case at bar. If a justifiable issue of contract law between Tartan on the one hand and Creek-Cumberland on the other is involved, which seems doubtful, the issue is not one of concern to the Commission, but to the courts of Kentucky.

Tartan raises no other issues of substance. There is no basis in the record for charges of personal unfitness of Messrs. Vogler (Cumberland) and Winters (Creek) to receive certificates of public convenience and necessity, as intimated in Tartan's brief (pp. 67–70).

Tartan's real desire is described in part of its prayer for relief—

> that some satisfactory unitization agreement be worked out with Tartan and said Applicants which will informally control production from the White Plains Field on a sound basis to conserve and recover all producible reserves in said field and to prorate the economic benefits of the gas produced between Creek and Tartan on an equitable basis related to the gas reserves in place under their respective properties * * * (Br. 70–71).

The desire is, for an order governing "the production, or gathering of natural gas"—a matter over which the Commission is specifically denied jurisdiction by Section 1(b) of the Natural Gas Act. See *Colorado Interstate Gas Co.* v. *F.P.C.*, 324 U.S. 581, 602–603; *Lone Star Gathering Co.*, 28 FPC 683; *cf. Northern Natural Gas Co.* v. *State Corporation Commission of Kansas*, 372 U.S. 84, 93.[3]

---

[2] The facts that (a) Texas Gas does not need Creek's production at the current high level, and (b) such production may "force Tartan to seek to increase its production level" (Tartan Br. 59–60), if true, are of course immaterial unless the Commission has jurisdiction to order prorationing.

[3] Apparently the matter has been brought to the Commission because Kentucky has no unitization statute; oil and gas ownership is subject to the law of capture. See 58 C.J.S., 211, 215 and cases cited.

Other Issues. There remains to be considered the sufficiency of the evidence to support the several applications digested at the outset, aside from the Drake application, already disposed of.

Miller abandonment application. This has been taken care of by Commission orders. The order of October 7, 1964, in *Humble Oil & Refining Company* and *other applicants listed herein*, Docket No. G–3072, et al., certificated Har-Ken Oil Co., Inc. and accepted as rate schedules its contracts with Cumberland; Har-Ken is free to produce and sell from its part of Miller's original dedication under its certificate. The letter-order of August 26, 1964, *supra*, rejected Tartan's application for partial substitution for Miller in respect of the abandonment; Tartan consequently has no standing to press the matter herein. The Miller Company has not appeared to prosecute the application and there is no evidence in support thereof. The application must therefore be denied.

Cumberland application. Cumberland has already built its pipeline gathering system, which connects three areas with estimated reserves as follows—Sharon School, 2 million Mcf; Harps Hill, 7 million Mcf; and White Plains, 1 million Mcf. The life of producing fields in western Kentucky is relatively short, with exhaustion to be expected in 4 to 5 years or less. Cumberland's depreciation of gathering facilities is accordingly set up on a three year life of pipelines and two year life of its single compressor, with estimated salvage value of $135,000. There is no question as to the financeability of the project; remaining indebtedness is less than $3,000. The evidence indicates that Texas Gas desires early exhaustion of reserves in the area in order to promote availability of the area for storage.

Cumberland's gross revenues for the following fiscal years ended August 31, 1960 were: $265,293; 1961, $204,151.58; 1962, $43,944.60; 1963, $21,475.02. Cumberland is currently drawing heavily on its supply from Creek, with gas runs in Mcfs in 1964 as follows: April, 45,238; May, 68,068; June, 58,168, or gross revenues for the three-month period of $36,009.54.

Operating revenues and net income after heavy depreciation charges are a minus figure for the years 1961 and 1962 (computation in Staff Brief, p. 13, adopted) and presumably also in 1963, when revenues were declining. As proposed by Staff, it is concluded that there is nothing in the record indicating that Cumberland's 6 cents per Mcf transportation charge is excessive.

However, in order that the consumer may be protected against "any risk of uneconomical operation or inability of Cumberland to earn a reasonable return on its investment or to attract capital" (Staff Br. 11), Staff recommends that Cumberland's certificate be conditioned to a ceiling of 6 cents per Mcf for its transportation and any other charges; *i.e.*, cost of purchased gas (at level established by the Commission) plus 6 cents is to equal maximum Cumberland sales price under the certificate here involved. Cumberland finds "no objection to the conclusions of staff counsel brief" (Reply Br. filed October 12, 1964, p. 12).

The Staff recommendation derives from the Commission action under similar circumstances in *Western Transmission Corporation*, Opinion No. 429 issued May 26, 1964, 31 FPC 1295, at pp. 1299, 1300; see also *Medina Gathering Corp.*, 30 FPC 227. The recommendation will accordingly be followed.

Staff also notes that based on annual revenue figures cited *supra*, Cumberland is subject to Commission jurisdiction as a Class D natural gas company, and subject to the appropriate accounting and filing requirements of such classification. See *Ben Bolt Gathering Co.* v. *F.P.C.*, 323 F. 2d 610, 611–612 (CA5–1963),

affirming 26 FPC 825 and 27 FPC 334. The certificate will specify Cumberland's status.[4]

Creek application. As we have seen, Creek is already producing gas under temporary authorization. Tartan's charges that Creek's rate of production will (a) ruin its well through coning and water intrusion, (b) cause influx ("fingering") of water, entrapping and preventing the flow of pockets of gas elsewhere in the reservoir, are backed up by expert testimony, but are refuted by equally expert testimony. On balance, it is determined that Tartan's charges are not proved, assuming *arguendo* that the Commission has jurisdiction to make such determination. It is of critical significance in this regard that the ultimate long-term value of the White Plain's North field may well be realized if the field is converted into a Texas Gas storage field, and that the Texas Gas Director of Gas Storage has found no objection to Creek's rate of production.

Price of Gas. No Statement of General Policy prices have been established covering western Kentucky, nor has the areal boundary been delineated. Cumberland's contract with Texas Gas regarding its own gas provides for a flat 21 cents per Mcf rate made up of 15 cents price plus 6 cents "for the gathering, transportation and necessary compression of said gas from the Seller's wells into Buyer's facilities". See Cumberland's Rate Schedule #1, filed June 8, 1959, Art. VII. The price paid by Cumberland for the Har-Ken gas is 10 cents per Mcf at 15.025 psia until Cumberland's gathering line to Harps Hill is amortized at the rate of 11 cents per Mcf, at which point of time ownership of the line will remain in Cumberland and the price of the gas will become a flat 15 cents per Mcf until exhaustion of the field. The Commission has certificated Har-Ken, as discussed *supra*.

Creek's price is a flat 15 cents per Mcf at the Wellhead. See Creek's Rate Schedule #2, filed October 16, 1963, Arts. VI and VII.

Staff has summarized all of the 101 producer contracts in Kentucky that have been certificated. Of 99 permanent certifications, 82 are at prices over 15 cents per Mcf, and 23 are at prices of 20 cents or above. The 15-cent price provided in the Creek-Cumberland contract is obviously not excessive, and neither Staff nor any other party to the record suggests any price condition.

There being no further objections or issues of substance presented in the record, it is plain that the Creek application should be approved without conditions.

ORDER

WHEREFORE, *It is ordered*, subject to review by the Commission, that—

(A) A certificate of public convenience and necessity is hereby issued to Cumberland Natural Gas Company, Inc. for the operations and sales as hereinbefore described and as more fully described in its application, supplementary filings, and the record herein, subject to the conditions hereinafter set forth.

(B) Cumberland Natural Gas Company, Inc. is a Class D natural gas pipeline company within the meaning of the Commission's Regulations under the Natural Gas Act and Uniform System of Accounts, and shall keep the accounts and make the filings appropriate to its classification.

[4] It is not necessary to discuss in detail Tartan's charges that Cumberland's case is inadequate and that its "operation does not serve public convenience or best public or private interest." The following comments will suffice: 1. If, as charged, (a) owned or controlled reserves are not at estimated levels, and (b) drainage claims well-founded, the matter is *damnum absque injuria* so far as the Commission's jurisdiction is concerned. No interests protected by the Commission will be prejudiced. 2. Cumberland's furnishing of information to Staff was adequate; in any event, this is a matter of Commission, not Tartan, responsibility. 3. The charges relating to Cumberland's "destructive" methods of operation are not sustained by the record; in any event, this is not a matter within the competence of the Commission on the facts of this case, but a matter of local law and private rather than public concern.

(C) The certificate issued to Cumberland Natural Gas Company, Inc. is conditioned to require that its rate for sales to Texas Gas Transmission Corporation shall not at any time exceed the sum of 6 cents per Mcf at 15.025 psia plus any rate lawfully in effect for the sale of gas to said Cumberland by producers of natural gas in the area of Cumberland's operations, including any rate applicable to Cumberland's own production, if any.

(D) The application of Truman Drake (Docket No. G–18744) is hereby dismissed for want of prosecution.

(E) A certificate of public convenience and necessity is hereby issued to Creek Oil Company, Inc. for the sale hereinbefore described and as more fully described in its application and the record herein.

(F) The application of J. C. Miller Oil Company, Inc. for a certificate of public convenience and necessity (Docket No. G–18743), having been disposed of by Commission action in Docket Nos. CI64–1107 and CI65–139 insofar as such application covers productive acreage, is hereby dismissed for want of prosecution.

(G) The abandonment application of J. C. Miller Oil Company, Inc. (Docket No. CI64–1107) is hereby denied.

(H) The certificates issued in paragraphs (A) and (E) are not transferable, and shall be effective only so long as Applicants continue the acts or operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(I) The issuance of the certificates in paragraphs (A) and (E) shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or of Part 154 or Part 157 of the Commission's Regulations thereunder, and is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the Applicants. Further, our action in this proceeding shall not foreclose or prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved, except as specified in paragraph (C) hereof. Nor shall the issuance of such certificates imply approval of all of the terms of the respective contracts basing the operations and sales herein certificated.

ROBERT M. WESTON,
Presiding Examiner.

NORTHERN NATURAL GAS COMPANY, DOCKET NO. CP64-255 (PHASE II)

ORDER DENYING APPLICATION FOR REHEARING

(Issued July 29, 1965)

On July 1, 1965, certain interveners in this case (Interveners),[1] consisting of eight existing customers of Northern Natural Gas Company (Northern), filed a joint application for rehearing of the Commission's Opinion No. 463, issued on June 2, 1965, 33 FPC 1163. By that opinion we granted Northern a certificate of public convenience and necessity authorizing it to construct and operate an extension from a point on its main line near Duluth, Minnesota, eastward across northern Wisconsin and into the Upper Peninsula of Michigan, and to sell natural gas to customers in these areas.

All of the material arguments advanced by Interveners in their application for rehearing were fully considered when we issued Opinion No. 463.

The Commission finds:

The assignments of error and grounds for rehearing advanced by Interveners present no facts or legal principles which would warrant any change or modification in the Commission's Opinion No. 463 and accompanying order.

The Commission orders:

The application filed by Interveners on July 1, 1965, for rehearing of Opinion No. 463 and accompanying order issued herein on June 2, 1965 is denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

PACIFIC GAS & ELECTRIC COMPANY, PROJECT NO. 2310

ORDER AMENDING LICENSE (MAJOR)

(Issued July 29, 1965)

Application was filed on August 12, 1963, and supplemented on October 31, 1963, by Pacific Gas & Electric Company, licensee for Project No. 2310, for amendment of its license to include therein, among other project works, certain unconstructed transmission line facilities as shown on certain Exhibit K drawings filed as part of the application. The staff has completed the processing of the application and supplement thereto insofar as they relate to the unconstructed transmission lines and we are authorizing their construction, operation and maintenance in this order without waiting for the completion of the staff work on the other aspects of the application so that construction may go forward without delay on the urgently needed transmission lines. This authorization will necessitate amending: subparagraph (i) of Paragraph (B) of the license to include Exhibit K drawings (FPC Nos. 2310-83, -85, and -90) to the extent

[1] Iowa Power and Light Company, Iowa Public Service Company, Metropolitan Utilities District of Omaha, Minneapolis Gas Company, Northern States Power Company (Minnesota), Northern States Power Company (Wisconsin), North Central Public Service Company, and Eastern Power & Gas Company.

hereinafter indicated; and subparagraph (ii) of Paragraph (B) to describe therein the transmission line facilities herein authorized.

The Commission finds:

(1) Public notice of the application has been given. No protests or petitions to intervene have been received. No conflicting application has been filed.

(2) The following described transmission line facilities are parts of the project within the meaning of Section 3 (11) of the Federal Power Act and should be included in the license for the project:

Line	No. circuits	Voltage kv	Miles	Status
Drum-Dutch Flat	1	110	5.5	Proposed
Dutch Flat No. 2 Tap	1	110	.5	Proposed
Chicago Park—Halsey Junction	1	110	14.0	Proposed

(3) Exhibit K drawings (FPC No. 2310–83, –85 and –90) conform to the Commission's rules and regulations and should be approved as parts of the license for the project to the extent that they show the unconstructed transmission lines.

The Commission orders:

(A) The license issued to Pacific Gas & Electric Company for Project No. 2310 is hereby amended, effective as of August 1, 1965, to include the transmission line facilities described in finding (2) above.

(B) Subparagraph (i) of Paragraph (B) of the license for the project is hereby amended to describe and include therein Exhibit K drawings (FPC Nos. 2310–83, –85 and –90) to the extent indicated in finding (3) above, and subparagraph (ii) of Paragraph (B) is hereby amended to include the following described unconstructed transmission line facilities:

Line	Number circuits	Voltage, kv	Miles
Drum-Dutch Flat	1	110	5.5
Dutch Flat No. 2 Tap	1	110	.5
Chicago Park—Halsey Junction	1	110	14.0

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license amendment. In acknowledgment of the acceptance of this license amendment, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

ATLANTIC SEABOARD CORPORATION, DOCKET NO. RP65–49

ORDER ACCEPTING TARIFF SHEETS FOR FILING SUBJECT TO PROVISIONS OF PRIOR ORDER

(Issued July 30, 1965)

Atlantic Seaboard Corporation (Seaboard) on June 29, 1965, tendered for filing certain revised and original sheets to its FPC Gas Tariff, Eighth Revised

Volume No. 1, and requests that such tariff sheets be allowed to become effective as of May 16, 1965.[1] Essentially, the proposed tariff sheets would: (1) Provide a form of service agreement limited to a two-year term pursuant to provisions of the Commission's order issued herein May 13, 1965; (2) amend the provision for Determination of Minimum Commodity Charges contained in the CDS–PR–1 and CDS–PR–2 rate schedules where appropriate by providing an adjustment of the base period volumes to reflect the transfer of volumes from such CDS rate schedules to the WS rate schedule; and (3) amend the Billing Demand provision of the WS rate schedule so as to permit a 10 percent leeway in the billing demand during a two-year transitional period.

On July 21, 1965, Washington Gas Light Company (Washington) filed a letter commenting upon the tendered tariff sheets and making certain objections relating to each of the above listed changes. Washington contends that the proposed form of service agreement (referred to above in "(1)") is not limited to the interim two-year period because provision is made to continue the contract in effect from year to year thereafter unless terminated by notice. Washington also complains that upon termination of such service agreement, the contract demand shall be the Buyer's Total Daily Entitlement, or as otherwise specified. It contends that Seaboard in this manner attempts to deny the Buyer the right to Winter Service unless the Buyer gives up its right to nominate its Contract Demand and Winter Service Quantities.

Washington contends that the changes referred to in "(2)" above would increase the minimum monthly and annual volumes required to be purchased under the PR rate schedules as now in effect, and accordingly, they will have a significant effect on the billings to purchasers under PR rate schedules. Washington points out that no data required by Section 154.63(b)(3) of the Commission's Regulations have been provided, and that no justification has been advanced for waiver of the statutory thirty-day notice requirement in support of Seaboard's request that the tariff sheets be made effective as of May 16, 1965. If the Commission were to suspend the tariff sheets, Washington asserts that provision should be made for hearing the issues involved with respect to the Partial Requirements tariff sheets, as well as those filed March 31, 1965, herein, in *Atlantic Seaboard Corporation, et al.*, Docket No. G–16401, *et al.*

Additionally, although Washington does not object to the provisions of the tariff sheets referred to in "(3)" above, which provide for a transitional period billing demand ratchet in the WS rate schedule, it does state that no reason appears to justify a retroactive effective date, particularly since the billing periods affected do not begin prior to November 1, 1965.

Lynchburg Gas Company (Lynchburg) on July 27, 1965, filed a protest in which it reasserted its position that the PR rate schedule and filings are all invalidated by prior court decision and should be rejected. Lynchburg's similar protest has already been entered for our consideration in the PR proceedings in Docket No. G–16401, *et al.* and we agree with Washington that consideration should be given in that proceeding with respect to all of Seaboard's tariff filings which relate to the PR issues, except that all issues relating to rate level shall remain subject to this proceeding.

Washington's contention that the requirements of Section 154 of our Regulations require Seaboard to provide data in support of its filing appears to disregard the fact that Seaboard purportedly has recently filed such data in this proceeding. With respect to Washington's objections to the form of service agreements, we note that the Commission's order of May 13th, contrary to Washington's as-

[1] Original Sheets Nos. 48A, 63A, and 91 through 96, and First Revised Sheets Nos. 1, 19, 26, 48 and 63.

sertions, did not prescribe the requirements of such service agreements, but provided that "any service agreements filed under the proposed tariff for a longer period than two years would be suspended". We intend to treat the proposed tariff sheets in similar fashion and give considerations in hearing to the specific terms of such forms of service agreement, including the substantive contentions made herein by Washington.

We do not agree with Washington that we should deny Seaboard's request that the tendered tariff sheets be made effective as of May 16, 1965. In view of the fact that all of the tariff sheets mentioned above are offered as integral parts of Seaboard's two rate revision proposals (*i.e.*, PR rate schedules and WS rate schedules), it would be unnecessarily confusing to have these tariff sheets become effective at a later date and thereby create a gap or lag period between them and the rate schedules which they implement and complement. Since we can see no disadvantage to any party from such retroactive treatment, we shall permit the tendered tariff sheets to become effective as of May 16, 1965, subject to all the terms and provisions of our order of May 13th and to our further orders issued herein.

The Commission orders:

(A) The proposed revised and original tariff sheets specifically described above are hereby accepted for filing as amendments to the tariff filed in this docket and suspended for one day by our order issued herein May 13, 1965, to be effective as of May 16, 1965, subject to refund and to all the terms and provisions of that order.

(B) All of the tariff sheets filed herein on March 31, 1965, and on June 29, 1965, which relate to the Partial Requirements (PR) issues shall also be subject to hearing and order in the proceedings in *Atlantic Seaboard Corporation, et al.*, Docket No. G–16401, *et al.*, except issues relating to rate level, which shall remain subject to this proceeding.

(C) Seaboard shall serve upon all parties appearing in the proceeding in Docket No. G–16401, *et al.*, copies of all of its PR tariff sheets as filed subject to this proceeding.

(D) As a condition of this order, Seaboard shall execute and file in triplicate with the Secretary of this Commission, an amendatory agreement and undertaking which will provide that its obligations with respect to paragraph (D) of the order issued May 13, 1965, relates both to the tariff sheets filed on March 31, 1965 (Eighth Revised Volume No. 1), and those tariff sheets which are the subject of this order to the same extent as if such latter tariff sheets had in fact been filed on March 31, 1965. Copies of such undertaking shall be served upon all purchasers and interested State commissions.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

BROWN-NEW HAMPSHIRE, INC., PROJECT NO. 2422

ORDER ISSUING LICENSE (MAJOR)

(Issued July 30, 1965)

Application was filed on November 1, 1963, by Brown Company, of Berlin, New Hampshire, for a license under Section 4(e) of the Federal Power Act (Act) for constructed hydroelectric Project No. 2422, known as the D. C. Hydro (Sawmill) Project, located on the Androscoggin River, navigable waters of the United States, in the City of Berlin, Coos County, New Hampshire.

By its order issued April 22, 1965, in Docket No. E–7112, 33 FPC 843, the Commission authorized the sale of certain electric facilities, including all hydroelectric plants, from Brown Company to Brown-New Hampshire Inc., and such acquisition was consummated on April 30, 1965. As a consequence, Brown-New Hampshire Inc., at its request, has been substituted as the Applicant for Project No. 2422. The latter, on May 17, 1965, filed an Exhibit L drawing as a supplement to the application for license.

The original dam and powerhouse were constructed in 1897–1898, which included six 325 horsepower vertical wheels connected to three jack shafts which were in turn connected through rope drives to a sawmill. From time to time thereafter additions and replacements were made, including the installation of generators during the period from 1906 through 1914. In 1953 sections of the original timber-crib dam were replaced by concrete gravity sections which included a gated spillway. Applicant contemplates the replacement during the summer of 1965 of the remaining rock-filled timber-crib section of the dam (about 273 feet long) with a concrete gravity overflow section about 250 feet long and, in anticipation of an expected increased power demand. Applicant plans to study the rehabilitation of the project generating facilities.

For the reasons set forth in our April 25, 1962, Opinion No. 357 (27 FPC 830), the license herein granted shall have an effective date of January 1, 1953, and a termination date of December 31, 1993.

The Chief of Engineers and the Secretary of the Army have advised that the plans of the project structures affecting navigation have been approved insofar as the interests of navigation are concerned.

The Department of the Interior, in reporting on the application, recommended for inclusion in any license for the project certain conditions in the interests of fish and wildlife and recreational resources usually included in licenses for such projects.

The Department of Health, Education, and Welfare, has recommended that any license for the project include a provision for review and possible revision of flow requirements when the effects of possible future installation of adequate treatment of water in the Androscoggin River can be determined. This provision is included herein as Article 33.

The State Planning Project, State of New Hampshire, has advised that, due to water pollution, the project is not suitable for any recreational development, but that at some future date, depending upon the abatement of such pollution, there may be some limited recreational potential. No conditions were recommended for inclusion in any license for the project. By Article 31 herein we are requiring Applicant to cooperate with State and local agencies in the interest of recreation in connection with the use of project lands and waters by the public and to keep us advised at stated intervals with respect to the results of such cooperation.

While the application for license did not include any transmission lines as part of the project works, Applicant advises that a study of the feasibility of redevelopment of the powerhouse and conversion to A.C. operation is planned to be initiated by July, 1965, and completed by July 1, 1966. It is possible, therefore, that some transmission facilities should be included in this license at a later date. Accordingly, in Article 32 herein, we are reserving the right to the Commission to determine at a later date what additional transmission facilities, if any, shall be included in this license.

The Commission finds:

(1) The project is located upon navigable waters of the United States.

(2) Applicant is a corporation organized under the laws of the State of New Hampshire, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the project.

(3) Public notice of the filing of the application has been given. No protests or petitions to intervene have been received. No conflicting application is before the Commission.

(4) The project does not affect a Government dam, nor will the issuance of a license therefor, as hereinafter provided, affect the development of any water resources for public purposes which should be undertaken by the United States.

(5) Subject to the terms and conditions hereinafter imposed, the project will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial public uses, including recreational purposes.

(6) The installed horsepower capacity of the project hereinafter authorized for the purpose of computing the capacity component of the administrative annual charge is 2,900 horsepower, and the amount of annual charges, based on such capacity, to be paid under the license for the project, for the costs of administration of Part I of the Act is reasonable.

(7) The exhibits designated and described in paragraph (B) below conform to the Commission's rules and regulations and should be approved as part of this license.

The Commission orders:

(A) This license is hereby issued to Brown-New Hampshire Inc., (Licensee) under Section 4(e) of the Federal Power Act, for a period effective January 1, 1953, and terminating December 31, 1993, for the continued operation and maintenance of the Sawmill Project No. 2422, located on the Androscoggin River, a navigable water of the United States, in the State of New Hampshire, subject to the terms and conditions of the Act which is incorporated herein by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Project No. 2422 consists of:

(i) All lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined, and/or interest in such lands necessary or appropriate for the purposes of the project, whether such lands or interest therein are owned or held by the Licensee or by the United States; such project area and project boundary being more specifically shown and described by a certain exhibit which formed part of the application for license and which is designated and described as follows:

Exhibit J	FPC No.	Title Sawmill Hydroelectric Development
Sheet 1 of 2	2422-1	Plan view of project area.

(ii) Projects works consisting of: (1) a dam approximately 714 feet long, including a concrete section about 328 feet long (with a floodgate section containing 5 floodgates, each 18 feet long and 13 feet deep) extending diagonally downstream from the left bank, a concrete gravity overflow section about 250 feet long extending generally downstream, and a concrete gravity section topped by steel drop flashboards (about 7.5 feet high) extending about 136 feet further downstream to the powerhouse); (2) concrete wing walls and abutments; (3) a powerhouse (adjacent to the right bank) with six 325 hp vertical turbines gear connected in pairs through horizontal jack shafts to two 500 kw D.C. generators and one 400 kw D.C. generator, and four 325 hp vertical turbines gear connected in pairs through two horizontal jack shafts which are, in turn, connected through rope drives to one 800 kw D.C. generator; and (4) appurtenant facilities; the location, nature and character of which are more specifically shown and described by the exhibit hereinbefore cited and by certain other exhibits which also formed part of the application for license and which are designated and described as follows:

Exhibit L	FPC No.	Title Sawmill Hydroelectric Development
Sheet 1 of 4 (revised)	2422-7	Plan view of station and dam.
Sheet 2 of 4	2422-4	Elevations of station and gatehouse.
Sheet 3 of 4	2422-5	Sections of station and gatehouse.
Sheet 4 of 4	2422-6	Plan view of operating floor.

Exhibit M Ten typewritten pages, "General Description of Mechanical, Electrical, and Transmission Equipment", filed in the Commission November 1, 1963.

(iii) All of the structures, fixtures, equipment or facilities used or useful in the maintenance and operation of the project and located on the project area, including such portable property as may be used or useful in connection with the project or any part thereof, whether located on or off the project area, if and to the extent that the inclusion of such property as part of the project is approved or acquiesced in by the Commission; also, all riparian or other rights, the use or possession of which is necessary or appropriate in the maintenance or operation of the project.

(C) This license is also subject to the terms and conditions set forth in Form L-3 (Revised August 1, 1964) entitled, "Terms and Conditions of License for Constructed Project Affecting Navigable Waters of the United States", 32 FPC 1114, which terms and conditions designated as Articles 1 through 29 are attached hereto and made a part hereof, except Article 25 thereof, and subject to the following special conditions set forth herein as additional articles:

Article 30. The Licensee shall pay to the United States the following annual charge, effective January 1, 1953:

For the purpose of reimbursing the United States for the costs of administration of Part I of the Act, a reasonable annual charge as determined by the Commission in accordance with the provisions of its regulations, in effect

from time to time. The authorized installed capacity for such purposes is 2,900 horsepower.

Article 31. Licensee shall cooperate with State and local agencies in the development and maintenance of access area and roads and such other facilities necessary for full recreational utilization by the public of project lands and waters, consistent with the terms of the license and the operation of the project. At the end of three (3) years from the date of issuance of this license and every fifth year, thereafter, Licensee shall advise the Commission of the results of cooperation with State and local agencies and of further recreation development at the project.

Article 32. The Commission reserves the right to determine at a later date what additional transmission facilities if any shall be included in this license.

Article 33. The Licensee shall cooperate with the appropriate Federal and State agencies in any necessary and/or desirable review and revision of flow requirements in connection with the pollution of the Androscoggin River by municipal and industrial wastes.

Article 34. On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply for steam electric, irrigation, industrial, municipal or similar purposes, consistent with the primary objective of the project. The Licensee shall receive such reasonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the Applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

Article 35. Licensee shall make a feasibility study for the rehabilitation of the Sawmill power plant. A report on this study shall be submitted to the Commission within one (1) year from the date of issuance of this license.

Article 36. The Licensee shall commence the replacement of the timber-crib section of the dam by a concrete gravity structure by August 1, 1965, and shall thereafter in good faith and with due diligence prosecute such construction and shall complete such construction within one year thereafter.

(D) The exhibits designated and described in paragraph (B) above are hereby approved as part of this license for the project.

(E) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgement of the acceptance of this license, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

PHILADELPHIA ELECTRIC COMPANY, PROJECT NO. 2355

ORDER APPROVING REVISED PROJECT EXHIBIT L DRAWINGS

(Issued August 2, 1965)

On April 29, 1965, Philadelphia Electric Company filed application for Commission approval of revised Exhibit L drawings for its proposed Muddy Run Pumped Storage Project No. 2355, located on the east bank of the Conowingo reservoir on the Susquehanna River and its tributary Muddy Run, in Lancaster and York Counties, Pennsylvania. The application was filed in compliance with Article 31 of the license, and was accompanied with reports from the licensee's board of consultants covering all proposed phases of project construction to date.

The showings on the Exhibit L drawings and the reports thereon by the licensee's consultants, together with Commission staff comments thereon, are discussed as follows:

Main Dam Across Muddy Run

The design of this dam is proposed to be changed to reflect the fact that the rock (schist) fill is of such nature that, after compaction, a drainage system and flatter surface slopes are required. Since the materials of construction might vary considerably, it is desirable that the Commission approve the general design of the dam as shown on design drawing, Exhibit L, Sheet 2 (FPC No. 2355–28) with the notation thereon that design changes may be necessary as the work progresses to maintain suitable factors of safety.

As shown on the construction drawings, the drainage system for the downstream slope underlies practically the entire downstream shell and is adequate. The upstream shell is shown as having a heavy blanket of free draining rock and hence its general design is satisfactory, except for its slope, as mentioned above.

The spillway, located on the west site of the canal about 800 feet from the tunnel intakes, will be an ungated concrete ogee structure capable of discharging the maximum flow resulting from hurricanes or from all project pumps in full operation.

Auxiliary Dam Creating Recreation Area

This proposed dam is shown as composed of rock shells with impervious core and transition filters between the core and the shells. This dam is shown as about 85 feet high with crest at elevation 530 feet, with a spillway created by excavating through the left abutment rock, capable of discharging the maximum flow resulting from hurricanes. The spillway sill is shown as set two feet below the maximum normal water surface elevation of 520 feet for the upper reservoir so that the water in the recreation pond will be partially changed each time a full cycle of pumped-storage is accomplished. The pond will also have a means of unwatering, or low level discharge, by means of a 6-foot diameter pipe and control through the auxiliary dam. Pursuant to letter-request by the licensee, filed July 26, 1965, the staff will make a notation on Exhibit L, Sheet 8 (FPC No. 2355–34) providing insofar as applicable the identical "Stability Analysis Data", "Load Conditions" and "Minimum Safety Factor Failure Plane Through Core" as are specified in Exhibit L for the main Muddy Run Dam.

Intake Canal

This proposed canal is shown as being concrete lined with an extensive system of drainage in back of the lining to prevent it from heaving when unwatered or when the water surface in the upper reservoir is low. The drainage system is shown as consisting of a network of drain openings made integral with the concrete lining where it contracts the rock with the drains feeding into a pipe system imbedded in the concrete lining of tunnel No. 3 and penstock No. 5. The lining is shown as extending about 1,000 feet above the tunnel intakes with its foundation curtain grouted at its upstream end to prevent leakage into rock seams which might endanger the powerhouse due to rock slides in the hill above the powerhouse. A system of drains in the hillside above the railroad tracks might be required, based upon exploratory wells in the field, particularly in view of the type of rock being encountered, and the exploratory wells should be observed before and after the filling of the upper reservoir. According to the report of the licensee's board of consultants, dated April 26, 1965, on file with the Commission, the hillside above the railroad tracks indicates a condition which could become unstable if the project would cause an unusual rise in ground water conditions. Accordingly, in Article 46 herein, we are requiring the licensee to have its board of consultants review the necessity of providing subsurface hillside drainage above the Muddy Run powerhouse, and provide a system of drains, if found necessary.

Powerhouse

The powerhouse is shown as being located further into the Conowingo reservoir and away from the Pennsylvania Railroad tracks to preserve, as much as possible, the natural stability of the rock hill between the powerhouse and the tracks.

The Commission finds:

The following-described Exhibit L drawings conform to the Commission's Rules and Regulations and should be approved as part of the license for the project, and Exhibit L, Sheets 1, 2, 3, 4, 5, and 6 (FPC Nos. 2355-20 through 25), which are now part of the license and which have been superseded, should be eliminated from the license:

Exhibit L	FPC No.	Title: Muddy Run Project
Sheet 1	2355-27	Plan of Development Structures.
Sheet 2	2355-28	Dam and Canal—Sections.
Sheet 3	2355-29	Tunnels—Plan and Sections.
Sheet 4	2355-30	Powerhouse Sheet No. 1.
Sheet 5	2355-31	Powerhouse Sheet No. 2.
Sheet 6	2355-32	Cofferdam and Tailrace.
Sheet 8	2355-34	Recreation Dam and Spillway.

The Commission orders:

(A) The Exhibit L drawings described in the above finding as conforming to the Commission's Rules and Regulations are hereby approved as part of the license for Project No. 2355, and the superseded Exhibit L drawings described in the same finding are hereby eliminated from the license for the project.

(B) The following articles are hereby added to the license for the project.

Article 46. The Licensee shall have its board of consultants review the necessity of providing subsurface hillside drainage above the Muddy Run powerhouse and, if found necessary by such board or by the Commission, the Licensee shall provide a system of drains approved by the Commission.

Article 47. Any changes authorized herein to provide suitable safety factors for the main Muddy Run dam and the recreation dam shall be shown on revised

Exhibit L drawings to be submitted by the Licensee for Commission approval within one year from the date of completion of the project.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this order. In acknowledgment of the acceptance of this order, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SOUTHERN CALIFORNIA EDISON COMPANY, PROJECT NO. 120

ORDER APPROVING REVISED PROJECT EXHIBIT

(Issued August 2, 1965)

On June 7, 1965, Southern California Edison Company, licensee for major Project No. 120, filed for Commission approval a revised Exhibit K showing that the Vincent Transmission Line has been looped into the Antelope Substation located adjacent to the line. The licensee states that the loop is necessary and desirable to improve load conditions in the area and to provide line protection.

The change does not affect any lands of the United States nor the amount of annual land charges prescribed in the license.

The Commission finds:

Revised Exhibit K (FPC No. 120–231) conforms to the Commission's Rules and Regulations and should be approved as part of the license for the project, and Exhibit K (FPC 120–58), now part of the license and which has been superseded should be eliminated from the license.

The Commission orders:

Revised Exhibit K (FPC No. 120–231) is hereby approved as part of the license for Project No. 120, and superseded Exhibit K (FPC No. 120–58) is hereby eliminated from the license for the project.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

COMMUNITY PUBLIC SERVICE COMPANY, DOCKET NO. E–7231

SUPPLEMENTAL ORDER AUTHORIZING ISSUANCE OF FIRST MORTGAGE BONDS

(Issued August 4, 1965)

By order issued July 21, 1965, 34 FPC 92, in the above-entitled matter, the Commission authorized Community Public Service Company (Applicant) to issue and sell at competitive bidding $5,000,000 maximum principal amount of First Mortgage Bonds, Series H, due 1995, subject to the provisions, among others, set forth in Paragraph (B) of that order as follows:

(B) The proposed issuance and sale of Bonds at competitive bidding shall not be consummated until:

(1) Applicant shall have amended its application pursuant to the requirements of Section 34.2(g) of the Commission's Regulations under the Federal Power Act

relating to compliance with competitive bidding requirements, and Section 34.2(h) of these Regulations relating to affiliation, and shall have either filed such amendments or shall have mailed them and advised the Commission by telephone and telegram as contemplated by Section 34.9 of the Regulations;

(ii) The Commission shall have approved the price to be received by Applicant for the Bonds and the coupon rate thereof by a further order.

Applicant on August 3, 1965, filed an amendment, pursuant to the requirements of the aforementioned Commission order, setting forth, among other things, that it proposes to accept, as representing the lowest annual cost of money to it, the bid of Salomon Brothers & Hutzler to purchase the proposed issuance of Bonds at the price of 100.06 percent of principal amount, with a coupon rate of 4¾ percent per annum.

The Commission finds:

(1) Applicant has satisfactorily complied with the requirements of Paragraph (B) of the Commission's order issued July 21, 1965, in the above docket, and under the bid it proposes to accept for the Bonds, the price to be received by Applicant therefor and the coupon rate thereof are reasonable.

(2) The proposed issuance and sale of Bonds, as hereinafter authorized, will be for a lawful object, within the corporate purposes of the Applicant and compatible with the public interest, which is appropriate for and consistent with the proper performance by the Applicant of service as a public utility and which will not impair its ability to perform that service, and is reasonably appropriate for such purposes.

The Commission orders:

(A) The price to be received by Applicant for the proposed Bonds and the coupon rate thereof under the bid referred to above, are approved as reasonable.

(B) The proposed issuance and sale of Bonds referred to above, upon the terms and conditions and for the purposes specified in the application, as supplemented by the amendment referred to above, are hereby authorized, subject only to the provisions of Paragraphs (D), (E) and (F) of the Commission's order issued July 21, 1965, in the above docket.

OPINION NO. 468

AREA RATE PROCEEDING, DOCKET NO. AR61–1; CLAUDE E. AIKMAN, ET AL., DOCKET NO. G–18466, ET AL.; NORTH CENTRAL OIL CORPORATION (OPERATOR), ET AL., DOCKET NO. CI60–435, ET AL.

OPINION AND ORDER DETERMINING JUST AND REASONABLE RATES FOR NATURAL GAS PRODUCERS IN THE PERMIAN BASIN

(Issued August 5, 1965)*

Syllabus

1. Just and reasonable rates for natural gas need not be determined upon basis of cost of service of individual producer. P. 176.
2. Sections 4 and 5(a) of the Natural Gas Act provide authorization for regulation of producer rates on an area approach. P. 176.

*Initial decision appears on p. 306. Orders issued August 26, 1965 and September 10, 1965 denying stay and providing for rehearing, *infra*, p. 590 and 34 FPC 846. Opinion No. 468–A issued October 4, 1965 amended opinion and order and denied rehearing, 34 FPC 1068. See orders re stay issued November 12, 1965 and February 11, 1966, 34 FPC 1286 and 35 FPC 211. Remanded, *Skelly Oil Company, et al.* v. *F.P.C.*, 375 F. 2d 6 (CA10–1967); Affirmed, 390 U.S. 747 (1968).

3. Just and reasonable producer rates may be made upon a group or geographical area basis; neither the Constitution nor Gas Act imposes any special formula for determining just and reasonable rates—so long as a sensible result is achieved. PP. 177, 178.
4. Uniform area pricing system adopted since it is well adapted to economic facts of the industry and practical administrative problems of achieving effective price control. PP. 178, 179.
5. Administrative feasibility is a vital element in effectiveness of any method of regulation and should be given great weight in assessing validity of area approach. P. 179.
6. Cases do not support contention that just and reasonable rate fixed on basis of overall costs and profits of area producers would be constitutionally confiscatory as to any respondent able to support a higher price on individual cost of service basis. P. 179.
7. There is no constitutional infirmity in statutory authority to fix just and reasonable rates on an area basis; in group rate-making, individual costs cannot be controlling. P. 180.
8. Procedure whereby area rate would become a floor rather than ceiling would destroy area rate concept as effective means of regulation. P. 180.
9. Area approach offers regulatory method best adapted to discharge of Commission's responsibility for protecting gas consumers while providing greatest incentive to producers to continue exploration. P. 180.
10. While history of negotiated prices in area is important consideration, to simply validate producers' negotiated prices would amount to abdication by Commission of its regulatory responsibility. P. 181.
11. Case for effective competition among producers in establishing just and reasonable rates has not been made on this record—thus contract price is beginning, not end, in establishing proper criteria for determination of just and reasonable rates. P. 183.
12. Reserves to production ratio cannot be accepted as regulatory standard in setting any limitations on producer contract prices. PP. 183–185.
13. Increase in directional drilling and 2-price system adopted here establishing a higher price for gas-well gas will encourage search for new reserves at a minimum overall cost to consumers. PP. 185–188.
14. Commission fixes December 31, 1960 as division date between new gas-well gas and old gas-well gas. P. 189.
15. Within the definition of gas-well gas as gas from dry reservoirs, gas condensate reservoirs and gas cap wells, classification of wells by appropriate State agency will be accepted for pricing purposes unless shown to be unreasonable. P. 189.
16. A composite cost showing must be basic ingredient in determining area rate with Commission exercising its judgment in light of all evidence. P. 190.
17. Cost of gas-well gas is the yardstick for all prices fixed here. P. 190.
18. Cost of new gas-well gas should be determined on basis of nation-wide data. P. 191.
19. In determining ceiling for new gas-well gas, preferable approach is one geared to recent cost of finding and producing gas rather than historical costs—historical costs will not necessarily reflect current realities. P. 191.
20. In determining area rates here, cost evidence was obtained from producer questionnaires, census data and other authoritative industry sources. P. 191.
21. Commission *finds* national average cost of new gas-well gas is 16.43 cents. P. 192.

22. In determining 1960 dry hole costs, it was proper to use questionnaire data to establish trend in exploration and development costs from 1958 to 1960 and to adjust 1958 census figures in accordance therewith. P. 192.
23. Capitalization of dry hole costs and other costs associated with unproductive ventures may well be useful in succeeding cases, although not supported here. PP. 192, 193.
24. In determination of area price ceiling for new gas-well gas, it was proper to include cost of geological and geophysical expenses, lease rentals and exploratory overhead in category other than dry holes. P. 193.
25. Since exploratory and development losses are expensed in year incurred, allowance therefor should be recouped from that year's production. PP. 193, 194.
26. To bring in necessary revenues, total cost of finding necessary volumes of gas must be translated into an allowance per Mcf of gas produced. P. 194.
27. Exploratory and development allowance provided here will permit industry to recoup from current production all costs presently being incurred in satisfactory level of exploratory effort. P. 194.
28. In costing new gas-well gas Commission finds production operating expense to be 2.70 cents per Mcf. P. 195.
29. No adjustment of net to marketed production should be included in cost computation because of venting or wasting, since this is negligible. P. 195.
30. In costing new gas-well gas, revenues received by producers from entrained liquids should be credited to the cost thereof reflecting current and expected experience—here Commission finds such net liquid credits to be 2.90 cents per Mcf. PP. 195–197.
31. Regulatory expense of 0.14 cents per Mcf should be included in new gas-well gas costs since there is no disagreement and amount appears reasonable. P. 197.
32. Production investment costs including successful well costs, lease acquisition costs and cost of other production facilities are capitalized to establish rate base upon which return must be allowed. P. 197.
33. In allowing producer to recover rate base by charges for depletion, depreciation and amortization over economic life of investment, Commission converts depletion, depreciation and amortization to Mcf basis and adds element for return on production investment per Mcf. P. 197.
34. Commission finds successful well costs to be 2.88 cents per Mcf of gas found. PP. 197, 198.
35. Commission allows a lease acquisition cost of 0.76 cents per Mcf of gas found. PP. 192, 198.
36. 0.31 cents per Mcf is a reasonable allowance for cost of lease equipment, related lease facilities and apportioned overhead investment. P. 198.
37. No allowance for growth is included in production investment cost. P. 199.
38. Total production investment cost is determined to be 3.95 cents, with 10 years as reasonable period for recovery of investment. P. 199.
39. Since some production investment costs must be made before gas begins to flow, a lag of one year in addition to the period of recoupment is approved. PP. 199, 200.
40. Courts have consistently held that the rate of return must be sufficient to attract new capital, be in line with that earned by comparable industries and be determined, not through automatic application of formulae, but through informed judgment taking into account all relevant facts. P. 200.

312-270—69——14

41. Legal precedent and financial requirements dictate that if unusual risks are inherent in production, a greater return should be allowed on investment therein in absence of record support for different conclusion. P. 201.
42. Under circumstances here the "true yield" method for determining capital costs cannot be used. P. 202.
43. Earning experience of production industry used here to fix allowable rate of return. P. 203.
44. On facts of this first area rate proceeding, Commission *allows* a 12 percent rate of return on net investment. P. 204.
45. Rejecting "balance sheet formula", Commission concludes that additive factors in traditional utility formula—cyclical expenses, materials, supplies and prepayments—are justified components of working capital allowances for producing industry. P. 205.
46. Recognizing erratic nature of company lease acquisitions, etc., compensatory "lease play" return is allowed on reasonable amounts in excess of working capital allowance based on traditional utility formula. P. 205.
47. For instant purposes, Commission *allows* total return on working capital of 0.35 cent per Mcf, including 0.15 cent as lease play return. P. 206.
48. In computing cost of gas-well gas, Commission includes royalties at 12.5 percent, yielding 2.05 cents per Mcf. P. 206.
49. In determining production tax allowance of gas-well costs, reasonable local taxes are valid basis for difference in ceiling prices between areas—accordingly actual taxes incurred in Texas and New Mexico will be allowed. P. 206.
50. The prices here established are the total prices including all tax reimbursements. P. 206.
51. No income tax allowance need be included in computing new gas-well gas costs. P. 206.
52. In determining price for new gas-well gas in each area, Commission must consider relevant factors in area other than cost-finding technique used here. P. 207.
53. There is no justification for any adjustment in cost-determined ceiling prices by reason of historically lower prices in the Permian Basin or to reflect fact that much of area gas is of less than pipeline quality. P. 207.
54. Ceiling prices fixed here are for gas of pipeline quality based on prescribed standards which provide both upward and downward adjustments in ceiling price of new gas-well gas. P. 207.
55. Having determined a 16.43 cents cost, Commission fixes 16.5 cents per Mcf [including state tax] as ceiling price for Texas produced new gas-well gas [including residue] and 15.5 cents for the three New Mexico counties. PP. 207, 208.
56. Sale of casinghead gas to an interstate pipeline under a Spraberry-type percentage contract is subject to Commission jurisdiction. P. 209.
57. Regulation should utilize industry practices developed to meet its problems to extent consistent with effective regulation. P. 209.
58. Volume and effect of casinghead sales in area [other than percentage or Spraberry contracts] has too small an impact on consumer prices to warrant a separate casinghead price. PP. 209, 210.
59. Ceiling price for new gas-well gas will be applicable to residue gas derived from new gas-well gas; ceiling price for all other gas will apply to residue gas derived from casinghead gas or old gas-well gas. P. 211.
60. No realistic cost of casinghead gas or residue gas derived therefrom can be established here. Casinghead gas, residue gas derived therefrom, and old gas-well gas should be similarly priced. P. 211.

61. It would be contrary to good conservation practice and good economics for price regulation to interfere with normal operation of market forces where these forces tend to provide greatest possible benefits to economy as a whole. P. 211.
62. Revenues from flowing gas should be based on composite historical costs, including fair allowance for exploration and development; price should also reflect producers' need for revenues from present sales to support future discoveries. P. 212.
63. Composite 1960 historical cost-of-service provides most solid basis in record for determining just and reasonable price of old gas-well gas and is used here as a basis for such price. P. 212.
64. Touchstone for flowing gas is the historical cost of gas produced in the area in 1960. P. 213.
65. Exclusion of small producer responses was proper since data provided by major producers was fully representative of area costs. P. 214.
66. Price for flowing gas is based upon two principal categories; production costs and exploration and development costs. P. 214.
67. Commission used relative cost method to divide joint production cost between liquids and gas in computing production operating cost allowance for flowing gas-well gas. P. 215.
68. A 12 percent rate of return is considered appropriate for flowing gas. PP. 215, 216.
69. Employing relative cost method Commission determines production cost for flowing gas to be 9.16 cents per Mcf. P. 216.
70. Exploration and development allowance for flowing gas should be computed on nation-wide basis. P. 216.
71. In determining exploration and development costs for flowing gas, Commission uses modified Btu method adopted in *Phillips* to allocate such expenditures between gas and liquids. P. 216.
72. In allocating total exploration and development expenses, Commission concludes that economic factor of 3.5 should be applied to Btu's of crude oil and condensate liquids production as compared to economic factor of 1.0 for Btu's of all gas. P. 218.
73. Economic weighting should be applied to national rather than to area production of hydrocarbons. P. 218.
74. Exploration and development costs for flowing gas-well gas determined to be 4.08 cents per Mcf. P. 218.
75. Total cost of flowing gas found to be 14.39 cents per Mcf. P. 218.
76. Commission fixes 14.5 cents per Mcf including tax as ceiling price for flowing gas in Permian Basin of Texas and 13.5 cents for the three New Mexico counties [plus applicable production tax]. P. 220.
77. Area ceiling prices for new gas-well gas and flowing gas must be adjusted for departures from pipeline quality standards. P. 221.
78. Commission discusses quality standards for sulphur, water, carbon dioxide content and other impurities. PP. 221–223.
79. Under present circumstances there is no need to establish any standard Btu content for flowing gas in Permian Basin. P. 223.
80. Commission provides for future proportional upward Btu adjustment for new gas-well gas from a base of 1050 Btu per cubic ft. and downward adjustment from a base of 1000 Btu's. P. 223.
81. Commission adopts 800 pounds pressure standard for Permian Basin. P. 224.
82. Commission sets forth principles and procedures for governing downward price adjustments where gas deviates from pipeline quality standards. P. 225.

83. No pipeline may include in cost of service any amounts paid for gas in excess of applicable ceiling price as adjusted by prescribed standards. P. 225.
84. Normally, it would not be in the public interest to certificate future gas sales [including gas flowing under temporary] above ceiling prices; producers will be afforded opportunity to show special circumstances warranting an exception. P. 226.
85. Commission discusses general guidelines for petitions seeking special relief from area price maximums, including questions of confiscation and abandonment of unprofitable sales. PP. 225–227.
86. Commission applies moratorium on increased rate filings above applicable area ceiling prices for a 2½-year period. P. 228.
87. Commission orders under Section 5(a) of the Act do not automatically have effect of tolling availability of Section 4 filings. P. 230.
88. Under Sections 5(a) and 16 of the Gas Act, Commission may impose reasonable moratorium on increased rate filings under Section 4, which are inconsistent with rates found to be just and reasonable. P. 230.
89. Policy will be to certificate new sales of gas at initial prices no higher than applicable area rate and upon condition that no higher rate be filed before January 1, 1968, unless instant proceeding is reopened to consider whether a different area rate should be adopted. PP. 230, 231.
90. Commission establishes a 9 cents per Mcf minimum price for Permian Basin; such rate may be filed without purchaser approval. PP. 231, 232.
91. Commission discusses refund question and prescribes requirements therefor. PP. 232, 233.
92. It is neither necessary nor desirable to provide outright exemptions for small producers. P. 234.
93. Existing favored-nation and spiral escalation clauses should not be denied effect insofar as they permit filings up to applicable area prices. PP. 236, 237.
94. Area rates established here shall apply prospectively for all jurisdictional sales being made under respondents' rate schedules whether they were being made when proceeding was instituted or begun subsequent thereto. P. 237.
95. For producers receiving certificates after proceeding was instituted and are not respondents here, separate proceedings will be instituted requiring them to show cause why area rates should not be applied to them. P. 237.
96. Refund obligations resulting from rate increases filed after institution of this proceeding will be subject to show cause order to determine why rates fixed here should not be used in determining refund obligations. PP. 237, 238.
97. It was proper for Presiding Examiner to call his own witness since he has authority—as a court does—to make sure that all necessary evidence is adduced. P. 238.
98. In landmark area rate proceeding arising under Section 5 of the Natural Gas Act, Commission *determines* just and reasonable rates for natural gas producers in Permian Basin.

Commissioners O'Connor and Ross *concurring* and *dissenting*.

Commissioner Black *concurring*.

Commissioner Bagge *not participating*.

Lynn Adams for Kerr McGee Oil Industries, Inc.

Jerome M. Alper, Guy H. Woodward and *George Otey, Jr.*, for Samedan Oil Corporation.

J. Evans Attwell for S. W. Richardson, d/b/a Richardson & Bass, and North Central Oil Corporation.

Arthur L. Brown, Jr. for Drilling and Exploration Company, Inc.

Bruce R. Merrill, Tom Burton, Robert C. Hawley and *Joseph C. Johnson* for Continental Oil Company.

Thomas J. Caldwell, Jr., Jerome M. Alper and *M. R. Lents* for Reef Corporation.

R. M. Coleman for Southland Royalty Company.

Warren J. Collins, Roy E. Pitts, Manuel J. Edling, Jr. and *E. A. Brown* for Lone Star Producing Company.

Louis Crouch and *E. C. Sargent* for Louis Crouch.

Angus A. Davidson, Francis O'H. Searle, W. L. Minturn, Charles E. McGee and *James T. McKinney, Jr.* for Sinclair Oil & Gas Company.

Kenneth A. Swanson for Aztec Oil & Gas Company.

John C. Dawson for Western Natural Gas Company; Pecos County El Paso Natural Gas Products Company; Barnhart Hydrocarbon Company.

Alfred C. DeCrane, Jr., James J. Flood, Jr., Paul F. Schlicher, and *W. N. Sands* for Texaco Seaboard, Inc.

E. J. Kremer, Jr., Stuart Scott, W. R. Dotson, Bernard A. Foster, Jr. and *Sherman S. Poland* for The Atlantic Refining Company.

N. C. Drayisic for Joseph I. O'Neill, Jr., et al.

Albert J. Feigen and *J. A. Warren* for James G. Brown & Associates.

Bert Fields and *Mark D. Jackman* for Bert Fields.

Robert D. Fitting for Craig & Willets.

Frank J. Duffy for Northern Natural Gas Producing Company.

Patrick Flynn and *Newton Rayzor* for W. H. Black; DST Exploration Corporation; C. E. Marsh, II; J. H. Vandenberk (Operator); Wolfson Oil Company; G. D. Putnam (Operator); Grace Marjorie Moran Parrish; Ralph Lowe; Limpia Royalties, Inc.; J. E. Jones Drilling Company; Haynes & V. T. Drilling Company; J. P. Gibbins; L. D. Crumly, Jr.; Brown & Key, Inc.; and Henry Black Drilling Company, Inc. (Operator).

Bernard A. Foster, Jr. for The British American Oil Producing Company; Honolulu Oil Corporation; Southland Royalty Company; Westates Petroleum Company; and Western Petroleum Company.

J. M. Fullinwider for A. W. Cherry and Cherry Brothers.

Randall F. Montgomery and *Albert Gackle* for Albert Gackle.

Douglas C. Gregg and *George D. Horning, Jr.* for Union Oil Company of California.

J. P. Greve for Sunray Mid-Continent Oil Company.

William J. Grove and *Carroll L. Gilliam* for Slade, Inc., et al.

Pat S. Holloway and *Sherman S. Poland* for Scott Hammonds.

Peck Hardee, Jr. for Felmont Oil Corporation.

Robert W. Henderson, Thomas G. Crouch and *Richard F. Generelly* for Hunt Oil Company; H. L. Hunt; Estate of Lyda Bunker Hunt, Deceased; Secure Trusts, W. H. Hunt, N. B. Hunt, Lamar Hunt, Caroline Hunt Sands and Loyd B. Sands; Caroline Hunt Trust Estate.

Richard F. Generelly and *Paul Hicks* for Placid Oil Company.

W. L. Hixon for Anderson-Prichard Oil Corporation.

Leo J. Hoffman, R. L. Donalson and *Leland Carter* for Delhi-Taylor Oil Corporation.

Pat S. Holloway and *G. Scott Hammonds* for George S. Hammonds.

Pat S. Holloway and *E. R. Barry* for Hanley Company.

H. K. Hudson, Kenneth Heady, John R. Rebman and *James G. Williams, Jr.* for Phillips Petroleum Company.

Homer D. Johnson and *Boyd Taylor* for Cabot Corporation.

H. W. Varner, Homer J. Penn and *F. P. Jones, Jr.* for Superior Oil Company.

Clyde E. Willbern and *Jack D. Jones* for Getty Oil Company and Tidewater Oil Company.

T. C. McCorkle, Clifford O. Stone, Jr., John F. Jones, William J. Grove, Carroll L. Gilliam and *J. P. Hammond* for Pan American Petroleum Corporation.

John C. Snodgrass for The Pure Oil Company.

Ivan V. Kerno and *Royal W. King, Jr.*, for Benedum-Trees Oil Company and Hiawatha Oil & Gas Company.

A. S. Grenier, Will A. Knight, A. M. Wiederkehr and *David Nicol* for Southern Union Gas Company.

W. T. LaGrone for Jake L. Hamon.

Frank Jones and *Gentry Lee* for Cities Service Producing Company, Cities Service Production Company, and Cities Service Oil Company.

Paul A. Lockhart, Jr. for E. Constantin, Jr.

Jesse P. Luton, Jr., John E. Thomason and *Arthur F. Whitt*, for Gulf Oil Corporation.

R. A. Lynch for Murphy H. Baxter; Leland Davison; S. T. Constantine; John L. Cox; Ed E. Watts; Curtis R. Inman; H. L. (Sonny) Brown; Claude E. Aikman, and Joseph S. Gruss.

G. E. McDaniel for J. P. Gibbins.

C. D. Ice and *Hamilton E. McRae* for W. P. Luse, et al. (C. O. Ice and Jack L. Burrell).

Steve Boone and *Hamilton E. McRae* for J. C. Barnes (Operator), et al.

Hamilton E. McRae for Jeanne E. Krebs; John W. Starr and Willetts & Craig; James L. Greene, Jr.; Thomas M. Sloan; Dekalb Agricultural Association, Inc. (Petroleum Division); J. N. Bartley, et al.; Abel & Bancroft; Carl J. Westland, Inc.; Texas Crude Oil Company; The Midland National Bank, Trustee, John I. Moore, Gladys Lomax (Mrs. W. L. (Pete) Lomax), Hazel Greene, Ethel W. Bird, et al. (Charles Allen Bird), Gordon Street, Inc. and Gordon P. Street, M. W. J. Producing Company and Martin, Williams & Judson.

W. E. Bakke, Jr. for W. E. Bakke.

R. Ken Williams for Gordon Street, Inc.; Gordon P. Street; M. W. J. Producing Company and Martin, Williams & Judson.

Jesse Foster, G. H. Lawrence and *A. C. McClain* for Humble Oil & Refining Company.

Charles L. Morgan, Jr. for Signal Oil and Gas Company.

Dixon Morgan and *William K. Tell, Jr.* for Sohio Petroleum Company.

E. Dale Morgan for R. L. Foree.

R. M. Moran for Marjorie Moran Parrish, et al.

Joseph W. Morris and *Edwin S. Nail* for Amerada Petroleum Corporation.

Lewis G. Mosburg, Jr. for American Liberty Oil Company; Sharples Oil Corporation, and Ashland Oil & Refining Co.

J. A. Moss, L. M. Thompson and *H. C. Stipp* for Cosden Petroleum Corporation.

Cecil E. Munn, Fred C. Higginbotham and *Conway Lammers* for General American Oil Company of Texas.

Cecil E. Munn, Stanley F. Davis, Jr. and *R. Daniel Settle* for Texas Pacific Coal & Oil Co.

Clayton L. Orn and *Joseph F. Diver* for Ohio Oil Company (Marathon).

Richard F. Generelly, Charles B. Parker and *Jack C. Oeffinger* for Forest Oil Corporation.

H. Bryce Parker for Argo Oil Corporation.

E. E. Parks and *F. A. Burdick* for Texas Gulf Producing Company.

Homer J. Penn for Republic Natural Gas Company.

Claude Proctor and *Justin R. Wolf* for Standard Oil Company of Texas.

Bryce Rea, Jr. for Miami Petroleum Co., Inc. and C. A. McClintic.

N. Randolph Reese for Johnson and French Oil Company.

William S. Richardson, Ross Madole, Tom P. Hammill and *Roy L. Merrill* for Socony Mobil Oil Company, Inc.

Bradford Ross, Hawley C. Kerr and *David M. Cook* for Skelly Oil Company.

H. Y. Rowe for Murphy Corporation.

William Scheurich, Robert A. Huffman, and *John L. Arrington, Jr.* for Schermerhorn Oil Corporation.

A. C. DeCrane, Jr., James C. Flood, Jr., Paul F. Schlicher, and *W. N. Sands* for Texaco Inc.

P. C. Shands for Barron Kidd.

John Ben Sheppard and *William W. Blanton* for Inland Natural Gasoline; Odessa Natural Gasoline Co.; E. G. Rodman; Rodman-Noel Oil Corporation; E. G. Rodman & W. G. Noel; Rodman, Tate & Noel; West Texas Gathering Company; L. R. French, Jr. and Earl Vest, et al.

Warren M. Sparks and *Arthur F. Whitt* for Warren Petroleum Corporation.

J. R. Stimmel for B. T. A. Oil Producers.

Oliver L. Stone, Joseph C. Spalding, Thomas G. Johnson and *W. T. Wise* for Shell Oil Company.

John R. Thompson for Westbrook-Thompson Holding Corporation.

Gus Vletas for French M. Robertson (Operator), et al.

John A. Ward, III, Philip D. Endon, Granville Dutton, Porter E. Noble, J. Colbert Peurifoy, Stanley M. Morley, Robert E. May, Louis Flax, John T. Ketcham and *Gene P. Bond* for Sun Oil Company.

K. B. Watson, W. N. Lampe and *Charles E. McGee* for Pioneer Production Corporation.

Chester L. Wheless and *C. C. Small, Jr.* for Santa Rosa Gas Company.

James L. White and *James R. Townsend* for TXL Oil Corporation.

M. B. Wilson for Great Western Drilling Company.

H. J. Rucker for George T. Abell; R. Searle McGrath and Pomeroy Smith, d/b/a McGrath & Smith.

D. E. Cooper for Rutter & Wilbanks, et al.

J. C. Crain, Jr. for Two States Oil Company.

E. H. Holcomb for Western Drilling Co.

R. A. Lynch for Herd Oil & Gas Company; Redfern Oil Company and Louis Crouch.

G. E. McDaniel for J. P. Gibbins.

James S. Robertson for Pauley Petroleum, Inc. and E. E. Fogelson.

Richard F. Generelly and *Gaston C. Jones* for F. A. Callery, Inc.

Cecil E. Munn for Texas Pacific Coal and Oil Company and General American Oil Corporation of Texas.

John B. Mason for El Paso Natural Gas Products Company.

Lambert McAllister, Francis J. Walsh, Elliott G. Flowers and *Craig McAllister* for Union Texas Natural Gas Corporation and Texas Gas Products Corporation.

C. Hayden Ames for San Diego Gas & Electric Company.

Alan G. Campbell and *Robert W. Russell* for The City of Los Angeles.

J. D. Duncan for Delfern Oil Company.

Malcolm H. Furbush and *John S. Cooper* for Pacific Gas & Electric Company.

Earl E. Hartley, William O. Jordan, Oliver E. Payne and *E. S. Johnny Walker* for the State of New Mexico.

Allen R. Grambling and *E. G. Najaiko* for El Paso Natural Gas Company.

George C. Mastor for Minneapolis Gas Company; Iowa Electric Light & Power Company; and Iowa Public Service Company.

James A. Gammon and *John A. McGrath* for Fuels Research Council, Inc.

Edwin L. Miller, Jr. for the City of San Diego, California.

John W. Scott and *Louis L. DaPra* for Minnesota Valley Natural Gas Company.

Morton Simon for Philadelphia Electric Company.

William I. Powell for Independent Petroleum Association of America.

Sam L. Robertson, Kirk Jordan and *William N. Tindell* for West Central Texas Oil & Gas Association.

O. C. Sattinger, J. R. Elliott, John P. Egan, J. David Mann, Jr., John E. Holtzinger, Jr., William W. Ross and *Harry L. LePape* for Pacific Lighting Gas Supply Co., Southern California Gas Company; and Southern Counties Gas Company of California.

William M. Bennett, J. Calvin Simpson, Sheldon Rosenthal and *Walter G. Linstedt* for the People of the State of California and Public Utilities Commission of the State of California.

Raybourne Thompson, T. G. McGreevy and *James W. McCartney* for Transwestern Pipeline Company.

William E. Torkelson, John W. Reynolds, Roy G. Tulane and *N. S. Hefferman* for the State of Wisconsin and Public Service Commission of Wisconsin.

Honorable John B. Connally, Linward Shivers, Will Wilson, James N. Ludlum, Richard Saxe and *Houghton Brownlee, Jr.* for the State of Texas.

Trent H. Zeppa for Delta Drilling Company.

Vincent J. Roach, Richard J. Connor, Frank J. Duffy, Jack C. Osborne and *Walter B. Gallagher* for Northern Natural Gas Company.

Lewis G. Mosburg, Jr. for King-Stevenson Oil Company, Inc., Service Drilling Company and Big Chief Drilling Company.

F. H. Pannill for Abel and Bancroft.

John Davenport and *William J. Grove* for Texas Independent Producers and Royalty Owners Association.

Thomas M. O'Connor and *Orville I. Wright* for the City and County of San Francisco.

David J. Bardin, Alan J. Roth and *Lawrence A. Gollomp* for the Staff of the Federal Power Commission.

INTRODUCTION

SWIDLER, *Chairman:*

This is the first area proceeding to determine just and reasonable rates for natural gas producers. It is the culmination of an effort initiated more than 4½ years ago, and which has been carried forward with the greatest sense of urgency on the part of all concerned. The area is the Permian Basin, one of the Nation's great oil and gas provinces, comprising the counties of Chaves, Eddy, and Lea, New Mexico, and Texas Railroad Commission Districts No. 7–C and No. 8.

Pursuant to Section 5 of the Natural Gas Act we here establish the future rates for jurisdictional sales of gas by producers in the area.[1] Also consolidated in this area proceeding are a large number of increased rate filings suspended under Section 4 of the Act and a limited number of applications for certificates of public convenience and necessity pursuant to Section 7 which are disposed of in a separate order issued this date.

The Commission initiated the proceeding by order of December 23, 1960 (24 FPC 1121). Prehearing conferences were held in Midland, Texas, beginning March 6, 1961, and in Washington on April 27, 1961. Forty-seven petitions to intervene were granted. The number of parties in the proceeding total 384, including 336 gas producers who are respondents.

The Commission prescribed questionnaires for the major producer respondents to obtain information with respect to Permian Basin and nationwide cost and operating experience. 26 FPC 247, 514, 531 (1961). A special form was prescribed for the small producers. 27 FPC 20 (1962). (The dividing line between major and small producers was determined by the level of nationwide jurisdictional sales, 10 million Mcf in calendar year 1960.) A significant early ruling in this proceeding was the Commission's order of May 14, 1962, holding that individual company cost-of-service evidence would not be received in evidence but that composite cost studies would be admissible. 27 FPC 943 (1962).

The hearings extended over a period of almost two years beginning on October 11, 1961, and closing on September 12, 1963. The examiner rendered his decision on September 17, 1964.

Fourteen individual and joint briefs on exceptions were filed on behalf of 111 respondents and numerous other interested persons, not parties, who joined with them. Most of the producers adopted the briefs on exceptions of Continental Oil Company (Major Producer Group).[2] Separate briefs were filed by the Commission staff, by the numerous interveners and as *amici curiae* by several groups with a substantial interest in the general problem.[3]

---

[1] The respondents are listed in Appendix A to this opinion.

[2] Respondents filing independent or supplemental briefs on exceptions included Amerada Petroleum Corporation (Amerada); Humble Oil & Refining Company (Humble); Hunt Oil Company, *et al.* (Hunt); Perry R. Bass (Operator), *et al.* (Bass); Phillips Petroleum Company (Phillips); Placid Oil Company (Placid); Standard Oil Company of Texas, a Division of California Oil Company (Standard); Sun Oil Company (Sun); Superior Oil Company (Superior); and Warren Petroleum Corporation (Warren).

[3] Interveners filing briefs on exceptions included Northern Natural Gas Company (Northern); King-Stevenson Oil Company, Inc., *et al.* (Oklahoma Interveners); the State of California and the Public Utilities Commission of California (jointly referred to as Cal-PUC); a group of California distributors (California Distributors); the City and County of San Francisco (San Francisco); the City of San Diego (San Diego); the State

Footnotes continued on following page.

Oral argument lasting three days was held beginning February 8, 1965, and the proceedings are now before us for decision.

SUMMARY OF EXAMINER'S DECISION

We acknowledge at the outset our indebtedness to Examiner Wenner for his penetrating analysis of the basic economics of the industry and his constructive proposals for a pricing system in harmony with the realities of the industry and the Commission's responsibilities under the Natural Gas Act. We must acknowledge also the helpful and constructive role of the parties to the proceeding. The cooperation of the respondents and the interveners with the Commission has been instrumental in achieving what the examiner has described as a breakthrough in reaching a workable method of producer regulation.

The examiner's decision would establish ceiling prices to apply, with certain exceptions, to all the sales being considered in this proceeding. These proposed ceilings were, in the case of rate schedules filed with this Commission on or after December 23, 1960, 16.75 cents per Mcf for gas-well gas, 15 cents per Mcf for residue gas, and 11 cents per Mcf for oil-well gas. In the case of rate schedules filed before December 23, 1960, the proposed ceilings were 13.5 cents per Mcf for gas-well gas and residue gas and 10 cents per Mcf for casinghead gas. The presiding examiner found, however, that the rates of producer-respondents making jurisdictional sales of less than 10,000,000 Mcf annually were just and reasonable and did not apply the proposed ceilings to any such respondents. Operators of processing plants, even if selling less than 10,000,000 Mcf annually, would have their rates limited by the proposed ceilings.

In the case of Section 4(e) proceedings consolidated herein, the examiner would order certain refunds which were to be computed for separate years and categories of gas on the basis of whether the industry had realized more than the proper revenue as well as on the basis of the individual rates collected. Deficiencies in one category would be used to offset excessive revenues in other categories each year. The presiding examiner further stated that since the record does not contain information needed to determine the actual or proper revenue for years other than 1960, for such years the parties within 90 days of the initial decision should submit draft orders with requests for information and with specific proposals regarding refunds.

The presiding examiner declared most favored-nation clauses and spiral escalation clauses in existing contracts to be inoperative and of no legal effect, and would allow no future change in rate resulting from any such clause to take effect. He fixed a minimum price of 9 cents per Mcf for residue and gas-well gas and 7 cents per Mcf for casinghead gas, and would allow rate increases to these levels to be filed with the consent of the buyer.

THE NATURAL GAS INDUSTRY AND ITS ACTIVITIES IN THE PERMIAN BASIN

The major known deposits of natural gas in the United States are located primarily in the States of Texas, Louisiana, Oklahoma, New Mexico, and Kansas. In addition, there are substantial reserves in the off-shore area Louisiana and Texas. More than 70 percent of all the natural gas produced for marketing in

of Texas jointly with Texas Independent Producers and Royalty Owners and West Central Texas Oil and Gas Association (Texas-TIPRO–WCTOGA); and the Independent Petroleum Association of America (IPAA). Briefs on exceptions as *amici curiae* were filed by Philadelphia Electric Company (Philadelphia); Associated Gas Distributors (AGD) (a group of approximately seventy major distributors) and the Oklahoma Independent Petroleum Association (OIPA).

the United States is sold in interstate commerce subject to the jurisdiction of the Commission. The Permian Basin alone accounts for about 11 percent of all the gas moving into the interstate market.

Natural gas and crude oil are both hydrocarbons, and they are often found in common reservoirs. As a result gas and oil production are interrelated. Our responsibility is confined to regulating the sales of natural gas. In his opinion (*infra*, p. 322) the examiner classified natural gas as "oil well gas" or "gas well gas", depending upon the conditions of production. He used the term "residue gas" to describe oil-well gas or gas-well gas after it has been processed and the liquids removed.

The natural gas industry is divided into three distinct segments. First there are the producers. Jurisdiction under the Natural Gas Act attaches when the gas is sold for resale in interstate commerce. The intermediate segment of the industry consists of the interstate pipeline companies which transmit the gas from the producing fields through large diameter pipelines as much as a thousand miles or more to centers of distribution throughout the nation. The third segment of the industry comprises the distributors of the gas in thousands of communities throughout the nation who are under state or local regulation exclusively, but who rely on this Commission to regulate the price at which they purchase gas at wholesale from the interstate pipelines. It should be noted that there is some overlapping in these categories. Some pipeline companies produce a share of their own natural gas and sell gas to other pipelines; others engage in distribution operations. Also, some producers perform gathering or transportation services and some distributors engage in production and transmission activities.

The Permian Basin is a major geological formation underlying much of western Texas and southeastern New Mexico. It is rich in oil and gas deposits, and is one of the major hydrocarbon producing areas in the Western Hemisphere.

About two-thirds of the gas produced in the Permian Basin is oil-well gas, that is, gas produced in conjunction with oil. By contrast, oil-well gas represents only about one-third of the total gas production in the continental United States. Oil-well gas is limited as to the hours of availability in a month since it is governed by the allowable oil production, which is subject to state regulation. The gas must be produced as the oil is produced, and it is not produced at any other time. It is produced on such a basis as will maximize the production of oil, for which it is the lifting agent. In these respects it contrasts unfavorably with gas-well gas, which while subject to state prorationing authority on a field basis, can be produced on a demand schedule. Oil-well gas is also produced at lower pressures than those common to gas-well gas. Production at less than 50 pounds pressure is not unusual in the case of oil-well gas. Since pipelines require pressures approaching one thousand pounds, low-pressure gas must be compressed before it can be taken into a pipeline stream. Processing of such gas will include one, two, three or more stages of compression.

In the Permian Basin, most oil-well gas is "sour" gas before processing.[4] Some of the gas from the Permian Basin also has an unusually high carbon dioxide content, ranging in some instances as high as 50 percent. Carbon dioxide is non-flammable and is presently useless to the petrochemical industry. When present in significant quantities it must be removed, entailing both processing costs and reduction in the volume of gas which remains for use.

[4] "Sour" gas is considered to be gas containing 10 or more grains of hydrogen sulphide or 200 or more grains of total sulphur per Mcf. The sulphur content of Permian Basin oil-well gas is generally higher than that of gas from any other area in the United States.

Historically, prices for gas in the Permian Basin have been lower than prices in most other areas. For many years oil-well gas was vented or flared, because there was no market for it. Three interstate pipelines, however, now make substantial purchases of gas in this area, and venting or flaring has been reduced to very low levels. El Paso Natural Gas Company (El Paso) began purchasing Permian Basin gas in 1945 for interstate transmission in connection with construction of the first natural gas pipeline from Texas to California. It was the sole interstate purchaser until 1954. In that year Northern Natural Gas Company (Northern) made its first purchase in the Permian Basin through Permian Basin Pipeline Company. In 1958 Transwestern Pipeline Company (Transwestern) began its purchases in the Permian Basin to supply the second pipeline from that area to California.

In 1961 El Paso purchased 73 percent of the Permian gas moving in interstate commerce; Northern accounted for 18 percent, and Transwestern for 9 percent. It is estimated that 85 percent of the gas moving in interstate commerce from the Permian Basin goes to California, an area of rapidly expanding demand by both industrial and residential consumers. The gas-producing wells in the Permian Basin, therefore, are some 900 to 1,300 miles from the principal points of use for the gas.

HISTORY OF THE DEVELOPMENT OF THE AREA APPROACH TO PRODUCER REGULATION

The Federal Power Commission's regulation of the rates of electric utilities and natural gas pipeline companies under the Federal Power Act and Natural Gas Act had uniformly been conducted on an individual cost-of-service basis at the time of the Supreme Court's *Phillips* decision on June 7, 1954,[5] which held that the Commission had jurisdiction over the regulation of wellhead gas prices, a jurisdiction the Commission had theretofore questioned. Faced with the novel problem of regulating thousands of gas producers, the Commission's first guarded attempts at producer regulation were on an individual company basis.[6] A few of the first rate increase filings were approved on the basis of cost evidence.[7] In other cases where the producer failed to submit evidence founded on the conventional rate base method of regulation, the Commission dismissed the rate increase[8] on the assumption that in the absence of such cost support it was bound to do so by *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (CADC–1955), certiorari denied 352 U.S. 829 (1956), a case dealing with a pipeline's own gas production. On review of these rate increase dismissals the Court of Appeals for the Fifth Circuit agreed that evidence as to field prices coupled with opinion testimony as to the need for an incentive price to induce adequate exploratory and development activity was not enough to demonstrate the rates were just and reasonable but held the Commission should have given the producers further opportunity to present evidence. The Court also indicated that the Commission need not require conventional rate base evidence if other cost evidence was available to insure that consumers were not paying more than a just and reasonable price, and need not fix separate rates for each producer if it found a uniform rate for the field desirable.[9]

The area concept also had its origin in proceedings under Section 7 of the Act upon applications for certificates of public convenience and necessity by gas

producers. As early as November 28, 1955, in *Cities Service Gas Co., et al.*, 14 FPC 134 (1955), affirmed as *Signal Oil & Gas Co.* v. *F.P.C.*, 238 F. 2d 771 (CA3–1956), certiorari denied 353 U.S. 923 (1957), the Commission conditioned a producer certificate to the price level prevalent in the area (14 FPC at pp. 147–148). In some later cases the Commission failed to impose a condition on the initial price, the important example being the *CATCO* case,[10] relating to the off-shore Louisiana area. As a result the Commission was reversed by the Supreme Court, which held that the Commission must impose a condition when the price was "out of line" in the area of production.[11] The area price concept was further developed in other cases remanding Commission orders granting unconditioned certificates.[12]

In the 1956–1959 period, a number of producer cases were initiated as investigations under Section 5(a) of the Gas Act. The first major case to reach the Commission on the merits was the original *Phillips* case,[13] on remand from the Supreme Court. The Permian case is a direct outgrowth of *Phillips*. In that case the Commission first considered the numerous questions relating to Phillips' cost-of-service, including the difficult allocation of costs between Phillips' oil production and its gas production. While utilizing individual company cost-of-service to pass upon a limited number of increased rate filings, the Commission concluded that such an approach was not appropriate for fixing just and reasonable producer rates for the future. Accordingly, the Commission refused to fix Phillips' rates for the future on this basis. The Commission spelled out in detail the many reasons why the individual company cost-of-service approach did not offer a reasonable basis for determining the just and reasonable prices for sales of gas by producers in interstate commerce. It also pointed out that the administrative burdens of literally thousands of separate proceedings in itself demonstrated the complete infeasibility of attempting to achieve effective regulation on an individual company basis.

On the same day, September 28, 1960, that it issued its *Phillips* opinion the Commission issued its Statement of General Policy No. 61–1 (24 FPC 818 (1960)) initiating the area rate approach by establishing guideline ceiling prices for the various producing areas. Separate levels were listed by the Commission for the initial prices at which it would certificate new sales of gas and for accepting without suspension price increases under existing rate schedules.

The Commission in prescribing guideline prices attempted to take into account all of the relevant information available to the Commission at the time. These guideline prices did not purport to be the just and reasonable rates, but rather the interim guides the Commission would follow in issuing certificates and in deciding whether to suspend rate increases until just and reasonable rates could be determined after hearing in area rate proceedings. As a result of the guideline price policy, in a practical sense the area rate approach has been in effect on an interim basis for the past 4 years.

On review, the *Phillips* opinion was affirmed by the Court of Appeals and by the Supreme Court.[14] The courts upheld the Commission in going forward with the area method of regulation. The Supreme Court said (p. 310):

> We respect the Commission's considered judgment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent pro-

ducers. We share the Commission's hopes that the area approach may prove to be the ultimate solution.

The Commission has proceeded with its program to implement the area rate approach. In addition to the present proceeding, Docket No. AR61–1, for the Permian Basin, a proceeding was begun on May 10, 1961, to determine area rates for the Southern Louisiana area, Docket No. AR61–2, 25 FPC 942 (1961), and on November 27, 1963, area rate proceedings were instituted for the Hugoton-Anadarko Area, Docket No. AR64–1, and for the Texas Gulf Coast Area, Docket No. AR64–2, 30 FPC 1354 (1963). These four proceedings, which are all under way, have as their purpose the fixing of just and reasonable rates for about 75 percent of the gas flowing in interstate commerce.

LEGAL BASIS FOR AREA RATES

In the second *Phillips* case (*Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963)) the Supreme Court, in holding that the Commission had not abused its discretion by rejecting the individual company approach, stated (pp. 308–309):

> * * * If we believed that such a departure from present concepts had little, if any, chance of being sustained, we would be hard pressed to say that the Commission had not abused its discretion in terminating this § 5(a) proceeding while undertaking the area experiment. For if area regulation were almost sure to fail, and if the individual company cost-of-service method of determining the reasonableness of rates had been abandoned, then there would be virtually no foreseeable prospect of effective regulation. * * *
>
> But to declare that a particular method of rate regulation is so sanctified as to make it highly unlikely that any other method could be sustained would be wholly out of keeping with this Court's consistent and clearly articulated approach to the question of the Commission's powers to regulate rates * * *.
>
> More specifically, the Court has never held that the individual company cost-of-service method is a *sine qua non* of natural gas regulation.

A number of producers contend nevertheless that we are pursuing an inherently illegal method of regulating the field price of natural gas. Sun, in particular, has been vigorous in asserting that the Natural Gas Act precludes us from fixing maximum area prices at a level lower than a producer could justify on an individual cost-of-service basis.

Sections 4 and 5(a) of the Natural Gas Act provide the authority for regulating the rates of the producers upon which the area rate order is based, but the breadth of the statutory scheme is evidenced also by the other provisions of the Act which confer broad regulatory authority over sales for resale by gas producers in interstate commerce. For example, Section 7 of the Act requires every producer to obtain a certificate of public convenience and necessity prior to commencing any interstate sale and also requires Commission approval before abandonment of any gas which has been dedicated to the interstate market. Section 16 of the Act empowers the Commission "to perform any and all acts and to prescribe, issue, make, amend and rescind such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this Act."

This area rate proceeding includes numerous individual rate increase filings in the Permian Basin which have been suspended. The rates specified in the filings have been collected subject to refund under the provisions of Section 4 of the Act, requiring that all rates shall be "just and reasonable." The area rate

order will also apply under Section 5(a) of the Act to those sales of the respondents in the Permian Basin which are not being collected subject to refund. Section 5(a) contains the statutory standard for fixing the future rates for the sales in the area since its provisions are also applicable to rates fixed under Section 4. Section 5(a) provides that:

> Whenever the Commission, after a hearing had upon its own motion or upon complaint of any State, municipality, State commission, or gas distributing company, shall find that any rate, charge, or classification demanded, observed, charged, or collected by any natural-gas company in connection with any transportation or sale of natural gas, subject to the jurisdiction of the Commission, or that any rule, regulation, practice, or contract affecting such rate, charge, or classification is unjust, unreasonable, unduly discriminatory, or preferential, the Commission shall determine the just and reasonable rate, charge, classification, rule, regulation, practice, or contract to be thereafter observed and in force, and shall fix the same by order: PROVIDED, HOWEVER, That the Commission shall have no power to order any increase in any rate contained in the currently effective schedule of such natural-gas company on file with the Commission, unless such increase is in accordance with a new schedule filed by such natural-gas company; but the Commission may order a decrease where existing rates are unjust, unduly discriminatory, preferential, otherwise unlawful, or are not the lowest reasonable rates.

While Section 4 of the Act prescribes that "all rates and charges" by *any* natural gas company shall be "just and reasonable", there is nothing in the Act which states or suggests that the justness and reasonableness of a particular company's rates cannot be determined on a group or area basis, rather than in a separate proceeding for each company. Operating under a statute with virtually the same rate-making provisions as the Natural Gas Act, the Secretary of Agriculture, with the approval of the United States Supreme Court, has long fixed maximum just and reasonable rates for all stockyard marketing agencies of a particular yard, based on stockyard-wide data, rather than individual rates based on the cost of individual agencies. See *Tagg Bros.* v. *United States*, 280 U.S. 420 (1930); *Acker* v. *United States*, 298 U.S. 426 (1936); *United States* v. *Corrick*, 298 U.S. 435 (1936). The Federal Communications Commission, also operating under similar statutory commands, has for a number of years fixed the maximum just and reasonable rates for the competing international telegraph common carriers on a "bellwether" basis, refusing, in the interests of its statutory mandate of providing the public with "adequate facilities at reasonable charges" (47 U.S.C. 151), to fix the rates "so that all carriers engaged therein may earn a fair return on the fair value of their property devoted to that service or even make some profit on their operations." *Postal Telegraph-Cable Co., et al.*, 5 FCC 524, 527 (1938). See also *The Western Union Telegraph Co.*, 25 FCC 535, 577–580 (1958).

Another example is action fixing a uniform price for milk in a milkshed, a form of regulation which was upheld in the landmark case of *Nebbia* v. *New York*, 291 U.S. 502 (1934). See *United States* v. *Rock Royal Co-op.*, 307 U.S. 533 (1939) (upholding Federal milk marketing orders under the Agricultural Marketing Agreement Act of 1937, 50 Stat. 246); *Sunshine Anthracite Coal Co.* v. *Adkins*, 310 U.S. 381 (1940) (upholding Bituminous Coal Act of 1937, 49 Stat. 991, authorizing Bituminous Coal Commission to impose maximum and minimum prices on an area basis). For the regulation of railroad charges the Interstate Commerce Commission has employed territorial classifications and group

rates. *New York* v. *United States*, 331 U.S. 284 (1947); see also *Ayrshire Collieries Corp.* v. *United States*, 335 U.S. 573 (1949).

It is thus well established that governmental price regulation of services and commodities can be lawfully exercised over industries providing commodities or services on a group or geographical area basis. Many different regulating authorities with jurisdiction over an entire industry or common group have been upheld in exercising their rate-making authority on a group basis rather than conducting separate proceedings for each individual company. Moreover, with special reference to rate regulation under the Natural Gas Act, the Supreme Court has long held that neither the Constitution (see *F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575, 586 (1942)) nor the Act itself imposes any special "formula by which the 'just and reasonable rate' is to be determined." *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, 600 (1944). See also *Colorado Interstate Gas Co.* v. *F.P.C.*, 324 U.S. 581 (1945).

The argument to the contrary stems primarily from a brief dictum in *Bowles* v. *Willingham*, 321 U.S. 503 (1944) in which the Court, in the course of upholding the lawfulness of war-time rent control legislation authorizing the Price Administration to fix, without advance hearing, maximum rents that were "generally fair and equitable", referred to the then recent *Hope* case for the proposition that "under other price-fixing statutes such as the Natural Gas Act * * * Congress has provided for the fixing of rates which are just and reasonable in their application to particular persons or companies" (*id.* at 517). It is significant that this statement predates the first *Phillips* case and its determination of the existence of Commission authority over producer rates. At the time of the Court's statement in the *Bowles* case the Commission had not yet undertaken a program for producer regulation and was, as it still is, regulating pipelines under individual company cost-of-service procedures. The Court's dictum contrasting group regulation under the rent control statute with the individual company regulation of pipelines cannot be interpreted to suggest that the latter would be the sole appropriate method of determining rates under the Act for producers whose business involves entirely different economic and administrative problems. On the contrary, the Court went on to state that "considerations of feasibility and practicality are certainly germane to the constitutional issue [of group versus individual company pricing]" (*id.*), that *Hope* had indicated that "price control, the same as other forms of regulation, may reduce the value of the property regulated" (*id.*), and that though "high cost operators may be more seriously affected by price control than others * * * it has never been thought that price-fixing, otherwise valid, was improper because it was on a class rather than an individual basis" (*id.* at 518).

Both the constitutional and the statutory questions, in other words, are not to be decided abstractly, but rather in the light of the nature of the specific ratemaking problem involved, and of what is required to achieve a sensible result. The necessity for accommodating the system of regulation to the circumstances of the industry being regulated was recognized by the Supreme Court in the *Nebbia* case, *supra*, in which it was held that due process under the Fifth and Fourteenth Amendments demand only that government regulation "shall not be unreasonable, arbitrary or capricious, and that the means selected shall have a real and substantial relation to the object sought to be attained" (p. 525). In the words of the Supreme Court in *Hope*, *supra*, at p. 602, "Under the statutory standard of 'just and reasonable' it is the result reached not the method employed which is controlling."

We believe the area approach should be adopted because it is well adapted to the economic facts of the industry and the practical administrative problems

of carrying out the primary purpose of the Act, which is to achieve effective price control. We remain of the view, originally set forth in our *Phillips* decision in 1960 (24 FPC at 547), that the area approach will enable us to carry out our ultimate objective of setting prices in all producing areas.

Basic to this determination is the fact that objective cost standards for fixing just and reasonable rates for producer sales can best be developed by examining overall producer experience. An individual producer may find only dry holes or marginal wells or his search for gas may result in finding a huge new gas field. A price fixed by his individual cost experience could thus either be too high for consumers in relation to other available supplies or too low to be fair to the producer, considering his risks. However, on a group basis, costs and rates can be developed which will be fair to all concerned. A uniform ceiling price for the area will provide a fair relationship between the aggregate price the consumer pays and the aggregate costs that the producers incur.

A uniform area pricing system is adapted to the economics of the natural gas industry. The producer who finds large reserves will achieve greater profits than the producer whose exploration efforts result in dry holes or marginal wells. Likewise, the producer whose enterprise is conducted with efficiency and economy will make more money than the producer who runs his business poorly. There is a strong incentive in area pricing to prudence and economy which does not exist in individual company cost-plus pricing in an industry where individual cost norms are difficult to determine and apply. True, individual returns will vary greatly, but this is as it should be, provided that profits in the aggregate are at a reasonable level.

The area regulatory pattern thus conforms to the characteristics of an industry which, as much as any, is one where there is scope for greater or lesser reward as dictated by the results of exploratory efforts. The area price will give producers the incentive they need to explore to meet the nation's increasing demand for natural gas and yet give consumers the protection which the Act intended.

An obvious advantage of the area rate approach which is of great importance is that it enables the Commission to determine in a single proceeding rates which would otherwise require hundreds of individual rate cases. It will thus eliminate the administrative bottleneck of company-by-company determinations. As we have noted, the four area proceedings now under way will complete the task for 75 percent of the gas flowing in interstate commerce in the entire nation.

The individual company approach would also result in a wide variety of rates in a single field, and even for the sales by co-owners from a single well, depending on their varying company-wide costs. Such a system would raise staggering burdens of administration. Administrative feasibility is a vital element in the effectiveness of any method of regulation and our experience dictates that it should be given great weight in assessing the validity of the area approach.

The cases do not support the producers' contention that a just and reasonable rate fixed on the basis of the overall costs and profits of the producers in the area would be constitutionally confiscatory as to any respondent who could support a higher price on an individual company cost-of-service basis. The Supreme Court in *Acker* v. *United States*, 298 U.S. 426 (1936) rejected the argument that the pricing orders of the Secretary of Agriculture, fixed on a group basis under the Packers and Stockyards Act, were confiscatory as to a particular market agency, concluding that "in ascertaining a reasonable unit cost as the basis of a uniform rate the Secretary was not bound to, and indeed he could not, adopt any one [market] agency's costs" (*id.* at 429) and that "regulation cannot be

frustrated by a requirement that the rate be made to compensate extravagant or unnecessary costs" (*id.* 431). See also *Tagg Bros.* v. *United States*, 29 F. 2d 750, affirmed *Tagg Bros.* v. *United States*, 280 U.S. 420 ("It is not incumbent upon the Secretary to fix the rates so high that all agencies in the business would make money whether they did a substantial business or not."); *Bowles* v. *Willingham*, *supra*; and *Aetna Insurance Co.* v. *Hyde*, 275 U.S. 440 (1928).

In the *Aetna* case rates of all the stock fire insurance companies doing business in Missouri had been reduced by the superintendent of insurance under a statute authorizing him to limit the rates charged so that the "aggregate collections" by all the companies would not exceed a reasonable rate. The superintendent reduced the rates uniformly and on appeal by the companies involved the Supreme Court concluded that the Fourteenth Amendment was not violated merely because the aggregate collections were not sufficient "to yield a reasonable profit or just compensation to all companies that happen to be engaged in the affected business" (p. 447).

Even in situations where it is appropriate to fix rates on an individual company basis, the courts have held that a company's rates may be fixed at a level below that which would be justified on a normal cost-of-service basis, where the low rates result from self-imposed contractual limitations. (See *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1955)). In an analogous situation, it was early held that a turnpike was not entitled to higher tolls on the basis of cost-of-service evidence where the real problem was the low volume of traffic (*Covington & Lexington Turnpike Road Company* v. *Sandford*, 164 U.S. 518 (1896).

These cases make clear that there is no constitutional infirmity in the statutory authority to fix just and reasonable rates on an area basis, and argue persuasively that in group ratemaking individual costs cannot be controlling. To hold otherwise would convert a proceeding to control prices into one that merely established a minimum rate above which every producer would be free to justify an above-ceiling rate in an individual company determination. A procedure under which the area rate would become a floor rather than a ceiling would destroy the area rate concept as an effective means of regulation. Such an approach to our consumer protection responsibilities under the Natural Gas Act would be neither just nor reasonable.

While we will not permit a back-door approach to individual cost-of-service under the guise of avoiding confiscation, there may well be circumstances in which a producer would be entitled to relief from his obligation to continue to render service to the public at the area rate or to make refunds for past periods. Accordingly we shall provide an opportunity for producers to petition for special relief from the area rate as set forth in detail at pp. 225–227. We cannot here visualize all of the circumstances which may serve as the basis for such relief, and will provide adequate flexibility to consider claims to such entitlement, but it is obvious that more must be shown than that the individual producer's costs exceed composite costs.

We believe the record in this case, judged in light of our experience in administering the Natural Gas Act, clearly supports the conclusion that the area approach offers a regulatory method which is best adapted to the discharge of our responsibilities for protecting natural gas consumers while providing the greatest incentive to producers to continue their search for needed additions to our gas supply.

CONTRACT PRICES AS A BASIS FOR REGULATION

In considering the appropriate guidelines for regulating producer rates on an area basis, we must dispose of one threshold argument. Certain of the producers contend that their contract prices should be approved as meeting statutory re-

quirements because they have been reached as a result of what is termed effective competition. IPAA contends that the examiner erred in not adopting as the standard for determining area prices the "market value" as established by natural gas purchase contracts negotiated at arm's length. A number of other producers propose a slightly more sophisticated version of this argument under which the contract rates negotiated at arm's length would be allowed to govern as long as the ratio of proven reserves to production did not become inordinately high.

We recognize that the history of negotiated prices in the area is an important element to be considered in reaching our decision. However, the producers' contention that the Commission should simply validate their negotiated prices, if accepted, would amount to an abdication of our regulatory responsibility.

The essential difficulty with the contract price argument is that there is nothing in this record which would justify a conclusion that reliance on contract prices unrelated to cost will "afford consumers a complete, permanent and effective bond of protection from excessive rates and charges," which is the purpose of the Act in prescribing that the rates and charges to consumers of natural gas should be just and reasonable. *Atlantic Refining Co.* v. *Public Service Commission of New York (CATCO)*, 360 U.S. 378, 388 (1959). See *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294, 309–310 (1963). *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672, 685 (1954). There are admittedly many producers selling gas to the interstate pipelines both in the nation as a whole and the Permian Basin in particular, but nothing in this record suggests that any competition among them in making sales to the pipelines is in any way adequate to assure that the public will secure gas at just and reasonable prices in the absence of regulation.

The history of price negotiations in the Permian Basin area is relevant to this issue. When El Paso was granted a certificate to supply natural gas to the California market on May 31, 1946, 5 FPC 115 (1946), it had entered into contracts with Phillips, Gulf, Shell, and Warren for a supply of gas in the Permian Basin. El Paso was to pay Phillips 3.5 cents per Mcf, Shell and Warren 3.0 cents, and Gulf 4.0 cents. These prices were subject to escalation by one cent every few years and to spiral escalation clauses by which they would be adjusted upward if El Paso's resale rates increased at the California border. Later, the spiral escalation clauses were deleted and indefinite favored-nation escalation clauses were substituted, except in the case of Phillips.[15]

In 1953, the Commission certificated Permian Basin Pipeline Company (a subsidiary of Northern Natural, and since merged into it).[16] The initial price amounted to approximately ten cents per Mcf for pipeline quality gas and was subject to escalation of one cent every five years.

In 1959, Transwestern Pipeline Company, 22 FPC 391 (1959), obtained a certificate to build a new pipeline from the Panhandle-Hugoton area of Texas and Oklahoma and from the Permian Basin to California. For the producers supplying gas to the pipeline the Commission authorized 16-cent prices and one 18-cent price, but the contracts called for prices as high as 21.8 cents in the West Texas-Permian area and 23.0 cents in the Panhandle-Hugoton area.

The escalation clauses in the contracts and the urgent pipeline requirements for large volume gas reserves contributed to a continuous rise in Permian Basin

[15] A favored-nation clause in a contract generally provides that the contract price shall be increased to equal higher prices paid others in a given area. There are numerous variations of the basic concept. Spiral escalation clauses are also indefinite in amount and provide for increases in producer rates in proportion to increases in the rates of the pipelines that are purchasing the gas from the producer.

[16] *Permian Basin Pipeline Co.*, 12 FPC 85 (1953).

prices. As a result of these escalation clauses and the expanding need for gas the 2.8-cent per Mcf average price paid by El Paso in 1947, its first full year of purchases, increased to 9.0 cents in 1954, the year of the first *Phillips* case, and reached 13.8 cents per Mcf in 1960. In that year, El Paso renegotiated most of its Permian contracts to eliminate the indefinite price clauses but was required to agree to price increases. The new prices ranged from 13.5 cents per Mcf to 17 cents per Mcf for gas of high quality.

We do not suggest that this historical pricing pattern in and of itself demonstrates the invalidity of the contract prices now in effect in the Permian Basin. On the contrary, it is obvious that the extremely low prices prevalent during the earlier period of large oil-associated supply and small demand bear no relationship to the cost of exploring for and producing gas even in that period, to say nothing of the present. However, while the record indicates that the costs of the various producers in the field differ markedly, there is no evidence that any significant volumes of gas of similar quality have ever been offered for sale at prices which reflect these cost differences.

The pipelines are far from being in a bargaining position which would validate the theory that a market price will necessarily be a just and reasonable price. On the contrary, the entire history of pipeline purchasing activity, since the end of the El Paso monopoly in the Permian Basin, has been characterized by the overriding needs of the pipelines to contract for the large blocks of uncommitted reserves essential to maintain their competitive position in developing markets (see *United States* v. *El Paso Natural Gas Co.*, 376 U.S. 651 (1964)) and their inability to accomplish this objective except as ever increasing prices. The abstention of the pipelines from these proceedings does not indicate that any significant change can be expected in the future. The fact that many pipelines are themselves producers with an interest in generally higher producer prices also cannot be overlooked.

There is no basis for concluding that there would be any effective producer price competition even if the pipelines were in a position to encourage it actively. On the contrary, until action was taken by this Commission, the entire pattern of producer contracts in Permian was on a basis of favored-nation and spiral escalation contracts calculated to assure that all producers would be treated alike and receive the highest going price both at the time of the contract and in the future. Typically, where a large producer has been able to command a higher price for a big block of gas needed by a pipeline entering the market or preparing for a major expansion, this has had the effect of raising the price to all other purchasers by all other sellers big and small, and regardless of their costs or profit ratios. Moreover it is obvious that a key factual question in determining whether there is effective competition is the amount of uncommitted reserves controlled by the large producers. The pattern of sales and annual deliveries in the Permian Basin strongly suggests that a limited number of producers control a large percentage of the gas reserves,[17] and it is significant that the producers in the exclusive possession of the facts have made no showing to rebut this conclusion.

In *United Gas Improvement Co.* v. *F.P.C.*, 290 F. 2d 133, 135 (CA5–1961), certiorari denied 368 U.S. 823 (1961), it was said that the supply of gas controlled by the producers is so restricted in relation to demand that they have economic power to bargain for prices that will be injurious to the public. The Court held that the Commission in exercising its authority may not act merely

[17] The record reveals that 5 producers account for about one-half of the jurisdictional sales in the Permian Basin and 15 producers make about three-fourths of all the sales of gas in the area.

upon proof that the prices in question were arrived at as a result of arm's-length negotiation, but must look behind the negotiated price. See also *P.S.C. of New York* v. *F.P.C.*, 287 F. 2d 146 (CADC–1961), *United Gas Improvement Co.* v. *F.P.C.*, 287 F. 2d 159 (CA10–1960). In so holding the court was reiterating the position it had taken in a series of cases involving just and reasonable rates for independent producers under Section 4 of the Act in which it had concluded that:

> * * * evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the intendment of the Natural Gas Act. Neither is evidence of the field price when coupled with the opinion of experts that the price must be high enough to provide an incentive for exploration and development of new sources of supply.[18]

If there is a case to be made for effective competition among producers in establishing just and reasonable rates it has not been made on this record. There is no evidence of competition between producers to make new sales by offering lower prices. On the contrary the primary competition revealed by the record was among the pipelines to secure new gas supplies at higher prices. Whatever the degree of competition which may exist among producers it has not been effective to afford gas consumers the protection to which they are entitled under the Natural Gas Act. Under these circumstances, there is no basis for assuming that prices which "have leaped from one plateau to the higher levels of another" will constitute a level which will be "the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest." *Catco*, *supra*, at pages 391, 388.[19]

It is thus clear that our examination of the contract prices of the gas producers is only the beginning and not the end of our task in establishing the proper criteria for determining just and reasonable rates.

RESERVES TO PRODUCTION RATIO AS A REGULATORY STANDARD

The producers contend that the gas supply situation is so critical that any significant limitation on contract prices would necessarily result in a dampening of essential exploration and development activity. In major part this argument revolves around the controversy as to the declining reserves to production ratio (R/P ratio) in the gas industry. This ratio has been as high as 32.5 to 1 in 1946 and it has steadily declined to about 18.7 to 1 in 1963, based upon the reserve figures provided by the American Gas Association and the American Petroleum Institute.[20]

The producers suggest that the reserves to production ratio should be the barometer by which the Commission is guided in setting any limitations upon the producers' contract prices and specifically that no such limitation should be imposed if the R/P ratio is not at least 20 to 1. Alternatively, they argue that, even

[18] *Bel Oil Corp.* v. *F.P.C.*, 255 F. 2d 548, 553 (CA5–1958) certiorari denied, 358 U.S. 804. See *Forest Oil Corp.* v. *F.P.C.*, 263 F. 2d 622 (CA5–1959); *cf. City of Detroit, supra.* As the court indicated in the *Bel Oil* case the expert testimony purported to show that petitioners "did not possess any dominating position in the industry, that natural gas is competitive with other non-regulated fuels, that the proposed prices were comparable with unregulated prices for local consumption; that maintenance of such a price is necessary to provide appropriate incentives for exploration and production of natural gas in Louisiana" (p. 551).

[19] As the Supreme Court pointed out in the *Catco* case, *supra* (at p. 388, footnote 7), this "declaration of which stems from the original version of Section 7 of the Act, was not intended to be changed by the 1942 amendment to the Act, which omitted that provision.

[20] The 1964 statistics available after the record was closed revise the R/P ratio for 1963 to 19.0 to 1 and reveal that the ratio in 1964 was 18.3 to 1.

if the Commission were to adopt the 17.5 to 1 ratio which the examiner believed was a reasonable target for 1970, present trends indicate that a lower ratio will be reached by that date; and they argue further that fixing area ceilings below existing contract prices would act as a brake on producer investment in gas exploration and development, and would therefore be contrary to the public interest.

In evaluating the producers' argument we must first analyze the forces which have determined the overall level of exploration and development by producers in the Permian Basin and elsewhere. The overwhelming fact which emerges from this record is that the vast increase in exploration and development of gas supplies which has taken place in the last two decades has resulted from the development of a system of interstate pipelines which has created an ever increasing nationwide market for gas. In short, the producers have stepped up their exploration and development activity because a market had been created for their product, even though during most of this period the prices have been far lower than fully allocated costs as determined herein.

We agree with the examiner that the emergence of directionality, *i.e.*, the ability of producers to direct their drilling activities toward either oil or gas brings into being for the first time an opportunity for price to play a significant role in increasing the supply of gas-well gas available to the interstate market. We have reflected this fact in the system of ceiling prices which we are adopting, because, in our opinion, the true benefits of directionality can be best achieved through a two-price system which, though based on costs, by its very nature provides a special inducement for exploration for gas-well gas. Such a system should permit price to play its full role in eliciting needed gas supplies. To permit still higher prices would only create windfalls for the producers with no assurance of any concomitant consumer benefits.

We agree that a strong exploration program which will discover and develop gas reserves in ample time to meet the increasing demands for gas is vital. Any method of fixing just and reasonable prices must take this into account. However, there is no reason to assume that there is a direct relationship between any calculated R/P ratio and the price of gas. On the contrary, the R/P ratio went steadily down during the periods in which gas prices were staging their most spectacular increases. It seems clear that even an exploratory program which will continue to add substantially more reserves annually than are produced is almost certain to fall short of preventing a further decline in R/P ratios.

As long ago as 1957, the AGA in "Gas Facts," 1957 edition, page 6, stated that the industry should not be preoccupied with a "hypothetical" reserves to production ratio, but should focus its concern on finding sufficient gas to replace that consumed each year. There is considerable doubt that it is desirable, from the point of view of the public or the industry, to require or encourage a high level of proven reserves many years in advance of their probable use. It is an extremely costly matter to find and hold reserves beyond those which are needed to assure ample supplies to consumers. The Commission's recent action in allowing exceptions to the 12-year minimum deliverability rule was a limited step in recognition of this fact.[21]

[21] Order No. 279, 18 CFR 2.61, 260.7; issued March 31, 1964, 31 FPC 750, prescribing the filing of annual reports by pipelines to furnish information with respect to total gas supply and deliverability stated. " * * * information from the reports will make it possible to relax the Commission's 12-year deliverability life requirement where the information supplied by the pipeline company indicates it has an active procurement program, its system extends into production areas with continuous exploration and the results thereof indicate continuing ability to meet gas requirements."

There is also serious question as to the reliance to be placed on the available R/P ratio figures. The proven reserve figures are admittedly conservative. The amount of proven gas reserves added each year depends more upon revisions of former reserve estimates which have varied widely than upon new findings. The true ratio of reserves to production is undoubtedly higher at the present time than would appear from available statistics.

For all these reasons, we believe it would be doubtful wisdom for this Commission to attempt here to fix the minimum appropriate level of reserves for the industry, and particularly we think that it would be unwise as well as futile for us to attempt to gear our pricing policies toward maintaining a reserves to production ratio of 17.5 to 1 or higher. The ratio has already declined very close to that point, and it will probably decline further regardless of the price of gas set by this Commission. Such a decline is the inevitable result of increases in consumption on the scale that we have witnessed in the past decade. Under these circumstances, any attempt to maintain a specific ratio of reserves to production by permitting interstate prices to reach their maximum contract level would be much more likely to affect adversely the market for gas than to induce substantially greater supplies.

The impracticability for the long term of attempting to maintain indefinitely a 17.5 to 1 ratio may be demonstrated by some simple figures. It is estimated that by 1980 natural gas use, already more than 15 trillion cubic feet a year, will have grown to 25 or more trillion and by the year 2,000 annual use can be expected to exceed 30 trillion. This level of use at the specified ratio would require reserves of 525 trillion cubic feet. By that date we shall have used some 900 trillion cubic feet of gas now in the ground, which would mean a total of some 1,400 trillion cubic feet would have been found. This is in the middle of the range of responsible estimates of the total gas found and to be found in the United States.

That the reserves ratio will decline is not necessarily a cause for concern for many years to come. The high ratios of the past were not a result of design or of business prudence, but resulted rather from lack of a market for the immense reserves discovered in the search for oil. In such circumstances the imposing reserve ratios of the past have little significance. With the intensive post-war development of the natural gas market we are witnessing an adjustment of the reserve ratio to economic levels.

While the adequacy of reserves is an important factor in our determination here, and will continue to be an important factor in reviewing area rates in the future, we cannot accept the producers' position that the maintenance of a particular R/P ratio justifies the existing and future contract prices, whatever they may be.

THE TWO-PRICE SYSTEM

The presiding examiner at *infra*, pp. 311–337 of his opinion presents a persuasive discussion of the "Economic and Institutional Factors Which Govern the Method of Establishing Area Rates."

The touchstone of the presiding examiner's decision is his conclusion that the industry is increasingly becoming able to direct its exploration efforts toward finding new gas-well gas as distinguished from finding gas as a byproduct in the search for oil. This newly documented ability of the industry to channel its exploration investment toward either gas or oil serves as the basis for a pricing system, which we here adopt, that will make use of the economic drive of the industry in order to bring needed gas supplies to consumers at the lowest reasonable price.

The Commission's staff and some of the interveners argue that even if some companies can effectively direct their exploratory activities toward gas, it has not been shown that all of the Permian Basin producers can do so. In making this argument special reliance is placed upon testimony to the effect that small producers do not have the resources necessary for effective directional exploration.

We have considered the evidence presented and we conclude, as did the examiner, that the larger producers in the industry have shown an increasing ability to direct their drilling activities toward either gas or oil, as they desire. Large producers maintain geological staffs and extensive files of geological information upon which the necessary predictions can be based. While small producers may lack the capital to maintain the organizations necessary for effective prediction, they often drill on lands obtained on farmouts from larger producers and thereby obtain the benefit of the geological knowledge required for directional drilling. To this extent it appears that even small producers are often able to drill with some assurance as to what they may expect to find.

In agreeing with the examiner's finding on directional drilling we do not mean to suggest that all exploration and development activity by producers is based upon reliable predictions as to what if anything will be found. What we do say is that on this record a major portion of the industry operating in the Permian Basin in recent years has demonstrated the ability by directional drilling to increase the known supply of gas, provided that the regulated price and the demand for gas justifies such an investment. Looking to the future we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves.

In referring to the incentive provided by the ceiling for "new" gas-well gas we are not providing any special, isolated amount as a separately designated incentive. The inducement to be found in the "new" gas price is of an inherent nature and is not represented by any sum earmarked for that purpose. The incentive is built into the two-price system. It provides a price for the future related to current and future costs and payable only to producers who discover gas-well gas and dedicate their discoveries to the interstate market.

A single price based on an average of historical and current costs could not provide the same incentive to explore for gas in the future even if it yielded the same revenue. A single price based on future costs will result in windfalls to those producers who acquired and sold gas under lower cost conditions. The two-price system thus holds out a reward to encourage producers to engage in further exploration and development while preventing excess and unnecessary revenues from the sale of gas developed at a period when there was no special exploratory activity directed to gas discovery.

The producers favor a single price and the arguments they make are aimed at obtaining the "new" gas price as the one price to be applied to all gas. We disagree. If a one-price system were to be adopted, average historical costs—not the higher current costs—would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas.

The producers support a contention for a single price based on current costs with the argument that current revenues provide financial support for current exploration and development. Assuming *arguendo* the factual basis for the argument, this is not an acceptable reason for "flowing gas" [22] being the bene-

[22] The term "flowing gas" in this opinion will be used to include old gas-well gas, oil-well gas and residue gas as explained in detail at *infra*, pp. 212–218.

ficiary of "new" gas-well gas prices. The producers' inducement to engage in further exploration and development directed toward gas comes from the knowledge that future gas supplies will receive a price which provides adequate compensation. Of course the availability of funds to seek new sources of supply is a factor to be considered in the fixing of all prices, and we have not overlooked this factor in the determination of the "flowing" gas price. It does not follow that a single price for all gas is required. On the contrary, as already stated, if such a ceiling were fixed high enough to elicit new gas-well gas supplies it would result in windfall profits for all other gas and if fixed low enough to reflect costs for old gas it would not assure adequate supplies for the future.

The record in this case was augmented by the econometric studies introduced by the staff and a rebuttal showing by the producers. These studies are, as the examiner stated, truly pioneering endeavors. The studies were not designed to support a specific rate recommendation or rate design but served to focus attention upon the important role of market demand among the considerations relevant to our decision. The studies indicate that advanced statistical and mathematical techniques can be useful in understanding the interaction of the price of gas at the wellhead and the demand in the marketplace.

The econometric studies in this case were based on the assumption of a one-price system and as noted by the examiner, "on a non-directional hypothesis." The quantitative results of the studies therefore cannot be relied upon in this case although the studies tend to support our conclusion that a two-price system is necessary and desirable to make positive use of the interaction of price and gas supply.

It has been suggested that providing a separate ceiling for new gas-well gas may retard the search for gas by inhibiting demand, on the theory that high prices may price gas out of some markets. This argument may have some merit as an abstract proposition but it misses the mark when applied to the facts of this case. We are not here fixing a ceiling that will increase prices but rather one to reduce unreasonably high prices and stabilize field prices generally. Furthermore while fixing a higher ceiling for new gas-well gas (including residue gas derived therefrom) we are also fixing a lower ceiling for all other gas. Certainly the ceiling prices fixed herein which will stabilize gas prices that have been increasing in the past cannot be a basis for predicting a declining market.

Some who opposed the examiner's price structure also argue that no need to encourage a stepped-up search for additional reserves at this time has been shown. It is pointed out that on a nationwide basis the AGA figures on proven reserves show that more gas has been found each year than was consumed, even though the reserve ratio as computed by AGA has been declining. It is also argued that we must take into account increasing discoveries of gas in Canada and Mexico as well as the possibility that technology may make new sources of energy available to supplement gas long before present reserves are exhausted.

It is beyond dispute that continuing exploration and development of new gas reserves is necessary in the public interest. The only question is the proper scale of the necessary effort. In the absence of a regulatory pattern which offers encouragement for the search for gas there is no guarantee that the present generally satisfactory pace of exploration will continue, much less increase to meet growing demands. New gas discoveries are the life-blood of the industry and are also essential to consumers who are tied to natural gas. This Commission cannot discharge its responsibilities to the public by relying on unsupported suggestions that gas supplies from distant sources or other forms of energy will suffice to meet an obvious need for new gas supplies to serve the needs of the

pipelines and of their consumers who are tied to the use of this fuel by large investments in gas utilization equipment.

In the past the greater part of the gas in the Permian Basin was found in the course of searching for oil but, as the examiner found, in recent years there has been a decline in drilling for oil. The future needs of the gas market can no longer be satisfied by the incidental discoveries in the search for oil. Accordingly, there will be a greater dependence on exploring for gas wells to bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas.

The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies. In order to assure that every effort will be made by producers to bring in new gas-well gas we also state our conviction that the ceiling set in this proceeding should continue to apply to all such new gas dedicated within the ceiling fixed herein even if in any later review of the area rate for the Permian Basin the evidence indicates that a lower price would be justified for future discoveries. We cannot bind the Commission for the future, but we state our view that any lower ceiling should apply only to new gas dedicated after the ceiling price may have been subsequently reduced.

On the basis of the record made in this proceeding and after careful consideration of the arguments against the examiner's findings on these points we conclude that there is substantial support for pricing new gas-well gas at a higher level in order to encourage the search for new gas reserves at minimum overall cost to consumers.

THE DATE OF DIVISION BETWEEN NEW GAS-WELL GAS AND OLD GAS-WELL GAS

The presiding examiner fixed December 23, 1960, the date this proceeding was initiated, as the date dividing new gas-well gas from old gas-well gas. Gas moving under contracts filed with the Commission before December 23, 1960, would be classified as old gas; gas moving under contracts filed on or after that date would be new gas. Staff has advocated a division date of January 1, 1961, which would offer the administrative convenience of making the division at the beginning of the calendar year. The California Distributors urge that the new gas price should be effective only as to gas moving under contracts filed after the conclusion of this proceeding. They argue that any incentive element included in a higher price for new gas can fulfill its purpose only with respect to gas dedicated to interstate commerce after the conclusion of this proceeding. The Major Producer Group, on the other hand, would apply the new gas price to all gas moving under contracts dated after June 7, 1954, the date when regulation of natural gas producers commenced.

The argument that a two-price system should have a 1954 breaking date is weak. The essential justification for the dual price system is that with the recent development of directionality there is for the first time a basis for believing that gas exploration and development activities may be responsive to price. To apply a price based upon the present cost of finding and developing gas-well gas to such gas (to say nothing of casinghead and residue gas derived therefrom) developed before the era of directionality would be inconsistent with the rationale of our decision and bestow a windfall on the producers.

There is more plausibility to intervener's argument that the cut-off date between new gas and old gas should be the effective date of this decision. We agree with the examiner, however, that the proper breaking point should be

at or near the end of 1960. As indicated *infra*, our price for flowing gas including old gas-well gas is being fixed primarily on the historical cost-of-service for this case as derived from the respondents' cost data supplied in response to the Commission inquiry. The test year for such data is 1960. Moreover, while the new gas-well gas ceiling is based on current rather than historical costs, the record indicates that directionality upon which the two-price system is based first became significant about 1960, and that costs have remained constant since that time.

There is another reason why we believe that a date approximating that fixed by the examiner is in the public interest. In effect, the two-price system which we have now prescribed was established for Permian and many other pricing areas in the adoption of our dual guideline ceilings by the September 28, 1960, Statement of Policy. Our pricing policy has given different treatment to gas dedicated since that date than to older gas. The expectations of producers which would presumably result from this policy of the Commission are thus consistent with the cost considerations referred to above.

The specific date for distinguishing between old and new gas-well gas presents, we believe, primarily an administrative problem. The examiner suggested December 23, 1960, the date of the institution of the Permian proceeding, but this would imply that the old gas/new gas breaking point in the various areas should depend upon when the particular area case was initiated—a date which has no necessary relationship to any of the considerations referred to above. It has been suggested that the September 28, 1960, date on which we issued the *Phillips* decision and the Statement of Policy should be utilized. However, our decision therein could hardly have had any such instant effect upon contract negotiations, to say nothing of the effect upon exploratory activity. Moreover, using September 28, 1960, as the dividing point would mean that some of the gas sold in the test year and used for determining old gas mixes would receive new gas treatment. We think that, all things considered, it would make more sense to set the dividing line as of the end of the 1960 test year. Accordingly, the new gas ceiling will be made effective for contracts entered into on or after January 1, 1961.

BASIC STANDARD FOR NEW GAS-WELL GAS CEILING PRICE

It becomes necessary at this point to define gas-well gas with more particularity. By gas-well gas we mean so-called nonassociated gas, that is, gas from dry gas reservoirs and gas condensate reservoirs, and gas from gas-cap wells.[22] Within these definitions the classification of gas wells by the appropriate state agency will be accepted for purposes of this decision in the absence of a showing that it is not a reasonable classification for pricing purposes. The definition of all other gas will be discussed *infra* at pp. 208 and 210.

Except for those parties who advocate existing contract prices as the primary regulatory standard, all parties recognize that costs must be a major factor in determining the area price. If the area rate approach is to rest on a solid foundation there must be an objective test by which the industry, the consumers and the courts can appraise the fairness of the price we fix. We are convinced that a composite cost determination is the bedrock on which a regulated price

[22] Gas-cap gas is a special category of gas from an oil reservoir that can be produced free from the influence of oil production. As a practical matter state classification of the small amount of gas in this category in the Permian Basin makes it reasonable to include gas-cap gas in the category of gas-well gas. If production of gas-cap is governed by allowables set for oil by the state agency, it will not be considered gas-well gas.

must be established. The issue is thus narrowed to one of the weight to be given cost evidence and the particular cost-finding technique we are here to adopt.

The Supreme Court in the second *Phillips* case, in upholding the Commission's abandonment of individual company cost-of-service and sanctioning the Commission's efforts to proceed with the area rate approach, observed with approval that the Commission had stated that area rates would be based on the " 'reasonable financial requirements of the industry' in each production area" and that "composite cost of service data will be considered in the area rate proceedings" (376 U.S. at 310).

Accordingly, we conclude that a composite cost showing must be the basic ingredient in determining the area rate. This does not mean that other factors should not be considered. The Commission must exercise its judgment and determine a rate in light of all the evidence in the record. For one thing, the rate must be one that the evidence indicates will elicit a level of exploration activity adequate to provide the increased gas supplies required by consumers in the future. There is also a need to exercise judgment in the design of the rates to avoid unnecessarily sharp and abrupt departures from existing pricing patterns and the business and community dislocations which could result. Of course, in fixing the rate of return, a key element in the cost determination, the Commission has wide discretion to consider these factors, so that to a considerable degree they can be accommodated within the framework of composite cost pricing. Nevertheless, we make clear that we do not confine ourselves to a cost calculation in determining just and reasonable rates.

Basic to our determination of the guidelines for the price of new gas-well gas is the selection of the method of cost finding to be adopted. We shall discuss later in this opinion the cost basis for all other gas but it may be helpful here to say that we shall use the cost of gas-well gas as the yardstick for all prices we fix in this proceeding. We do so for two reasons. First, the record reveals that casinghead gas and other associated gas are found largely as a by-product of the search for oil. Historically, casinghead gas has not been priced on a cost basis and any cost-finding technique is unrealistic which assigns large sums for exploration and development to casinghead gas. A second and related reason is that gas-well gas costs are much more meaningful because they are far less dependent upon allocations between gas and oil than are the costs of casinghead and other associated gas.

The parties suggested three basically different methods for determining the cost of new gas-well gas. The main producer presentation is an estimate of the cost of financing new supplies of gas-well gas on an industry basis in which all exploration and development (E&D) expenses are capitalized and a discount rate of return utilized. The California Distributors also presented a gas-well gas cost study based on published national statistics and the answers by respondent producers to the Commission's cost questionnaire but instead of capitalizing E&D costs, expensed them, and utilized a conventional rate of return. Both methods provide a nationwide cost for gas-well gas keyed to the cost of finding and producing new gas supplies. The third cost approach, presented by the Commission's staff, is a composite presentation patterned after the individual company cost-of-service approach in which there is determined the historical cost per Mcf of gas-well gas production. The staff also presented a similar composite presentation limited to Permian Basin area costs.

A preliminary question in determining the methodology of cost finding is whether costs are to be determined on an area or a national basis. As the ex-

aminer pointed out, the question is not whether a national price should be established but whether national or area costs should be used as the basic standard for fixing the future price of new gas-well gas in the Permian Basin. All parties agree that exploration and development operations are conducted by the industry on a national basis because it is impossible to isolate E&D by areas. Without adopting all of the reasons advanced by the examiner at *infra*, p. 339, *et seq.* of his opinion we agree with the conclusion that the cost of new gas-well gas should be determined on a national basis. Perhaps most persuasive is the fact that we are fixing a price based upon current cost of finding an Mcf of gas and that much, if not most, of the relevant information is available only on a national basis. It may be that in some areas production costs may vary sufficiently from the national average to warrant a different treatment but on the record in this case we agree that cost of new gas-well gas should be determined on the basis of nationwide data.

The examiner adopted, with modifications, the cost presentation of the California Distributors. We agree with the examiner that in determining a ceiling for new gas-well gas which is to serve as an incentive to search for additional gas the preferable approach is the one that is geared to the recent cost of finding and producing an Mcf of gas rather than the historical cost based on production volumes. Historical costs will not necessarily reflect current realities.

A price based on the current cost of finding and producing an Mcf of gas-well gas, on the other hand, should provide the economic incentives to find and sell gas under prevailing conditions at rates which are keyed to industry needs and at the same time protect the interests of consumers.

We believe that the method of costing we have adopted in this proceeding is required on the basis of the record before us and that it provides a sound basis for our decision. We emphasize, however, that our conclusions herein should not be construed as necessarily constituting the final solution of this intricate problem. Other methods of estimating the new gas cost may be given further consideration in succeeding cases if adequately supported.

THE COST OF NEW GAS-WELL GAS

We shall now proceed with an examination of the presiding examiner's determination of the cost of new gas, and of the exceptions thereto, in our determination of the area price ceiling of new gas-well gas.

A word of explanation is in order as to the variety of data sources utilized for determining the costs of gas in this proceeding. The natural gas producers, unlike electric power companies and natural gas pipelines, have not as yet been required to conform their books to a uniform system of accounts. The petroleum producers typically do not reveal their cost experience or accounting treatment in depth. When this proceeding was initiated there were no statistics available based on a uniform set of accounts to provide the necessary information for making the cost determinations in this proceeding. The cost questionnaire promulgated by the Commission was designed to fill this information gap in part and the responses have supplied a vital source of information for determining costs in this proceeding. In addition Census data and other well-recognized and authoritative industry data sources were utilized by various witnesses in the proceeding. The record is thus built upon a variety of sources which we believe in combination provide an adequate basis for the costs we have found.

The presiding examiner found that the national average cost of an Mcf of new gas-well gas was 16.88 cents. His computation and our modifications thereof may be summarized as follows:

	Cost in cents per Mcf	
	Examiner	Commission
Exploration and development costs:		
Dry holes	1.42	1.42
Other exploratory costs	1.59	1.59
Adjustment for exploration in excess of production	1.11	1.11
Production operating expense	2.88	2.70
Net liquid credit	(2.68)	(3.10)
Regulatory expense	.14	.14
Depletion, depreciation, and amortization of production investment costs:		
Successful well costs	2.88	2.88
Lease acquisition costs	.76	.76
Cost of other production facilities	.31	.31
Return on production investment (at 12 percent)	5.21	5.21
Return on working capital	.20	.35
Subtotal	13.82	13.37
Royalty at 12½ percent	2.11	2.05
Production taxes [24]	.95	1.01
Total	16.88	16.43

[24] Texas production taxes of 7 percent have been used in the Commission's computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner.

EXPLORATION AND DEVELOPMENT COSTS

Dry Hole Costs

Adopting the California Distributors' presentation, the presiding examiner derived a dry hole cost of 1.42 cents per Mcf principally on the basis of data published by the United States Bureau of Census, Census of Mineral Industries for 1958 (1958 Census), with respect to drilling costs per foot. Since there were no such census costs available for 1960, he established a trend for such costs by comparing 1958 and 1960 cost data obtained, in response to the questionnaire circulated by this Commission, from producers of more than 10 million Mcf annually, producing in the Permian Basin.[25] He then adjusted the 1958 Census figures in accordance with the trend established from the questionnaire data to establish the 1960 costs.

The Major Producer Group objects to the examiner's use of questionnaire data to establish a trend in E&D cost from 1958 to 1960 and adjusting the 1958 Census figures on the basis of the trend established. We think the examiner was correct in determining that the questionnaire data are valid for purposes of establishing a trend in the entire industry. We adopt the reasoning of the initial decision upon this point, and the 1.42 cents per Mcf cost, as set forth in Appendix B, pp. 291, 292.

As we have already noted, other methods of computing dry hole costs were suggested in the record. Of particular interest is the alternative method of cost determination, advocated by the Major Producer Group, often called the project method, which capitalizes the total cash outlays to acquire a capital asset (*i.e.*, project) and allows a return on that investment over its productive life. Under this method, dry hole costs and other costs associated with un-

[25] The questionnaire data includes costs from a few producers of less than 10,000,000 Mcf annually who also responded to the questionnaire. However, the inclusion of this data does not affect the results.

productive ventures would be capitalized along with the cost of productive ventures. We find that this alternative method which would constitute a departure from our treatment of E&D in prior proceedings as well as a departure from present industry accounting practices is not adequately supported in the record. The inadequacy is especially notable with respect to the cost of capital for establishing the fair rate of return to be allowed on the computed investment base. However, capitalization of E&D may well be a useful approach and we do not foreclose in succeeding cases further consideration of this alternative method of costing or of improvements in the cost-finding techniques herein employed.

Other Exploratory Costs

In a category for exploratory costs other than dry holes, the examiner included geological and geophysical expenses, lease rentals, and exploratory overhead. These costs were the subject of testimony by Witness Roseman for the California Distributors and Witness Park for Texaco Inc. Roseman estimated the cost of geological and geophysical expenses and lease rentals on the basis of their relationship to lease acquisition costs as shown by the Chase Manhattan Bank's Annual Analysis of the Petroleum Industry for 1961. Since the purpose and result of the outlays for geological and geophysical activities and lease rentals is the purchase of leases, there is a direct relationship involved. The Chase survey shows that geological and geophysical expenses and lease rentals averaged 138 percent of lease acquisition costs in the period 1957 through 1960, the same period Roseman used in computing lease acquisition costs. Having determined that the lease acquisition costs for that period were 0.76 cent per Mcf (see *infra*, p. 198), Roseman accordingly computed the geological, geophysical, and lease rental costs at 1.05 cents per Mcf.

Exploratory and developmental overhead were calculated by Roseman on the basis of their relationship to total finding and developmental costs. The 1958 Joint Association Survey, the only published source of such data, established overhead costs as being 8.4 percent of total finding and developmental costs, or 0.54 cent per Mcf. (Total finding and developmental costs were 6.42 cents per Mcf, this being the total of 1.05 cents for geological and geophysical expenses and lease rentals, 1.42 cents for dry holes, 2.88 cents for successful well costs, 0.76 cent for lease acquisition costs, and 0.31 cent for cost of other production facilities.) Adding 0.54 to the 1.05 cents per Mcf costs for geological, geophysical, and lease rental costs, results in a total of 1.59 cents for the category of Other Exploratory Costs.

Witness Park used a different method. He combined geological and geophysical expenses, lease rentals, and overhead into a single item. He then found that the ratio of this item to dry hole exploratory expense, based on the Joint Association Survey, was 1 to 1. His result is 1.56 cents.

We believe that Witness Roseman's approach which computes each of these items of cost on the basis of comparisons with items to which they are functionally related is preferable. In any event the difference between the two witnesses is *de minimis* and no exceptions were taken to the examiner's determination of 1.59 cents per Mcf based upon Roseman's testimony. We therefore adopt the examiner's finding as supported in the record.

Adjustment for Exploration in Excess of Current Production

The record establishes that additions to proved reserves of natural gas in the United States have exceeded production in each year. We believe it essential to encourage a level of exploratory effort which will continue to provide for findings in excess of production. Since exploration and development losses

are expensed by the industry in the year incurred, and are so treated here (but see our discussion of the possible use in the future of the project method, *supra*, pp. 192, 193), the allowance for such losses should be recouped from production during that year. The total cost of finding the necessary volumes of gas must be translated into an allowance per Mcf of gas produced so as to bring in the necessary revenues. To this end a conversion factor is necessary to adjust the per Mcf cost of unsuccessful E&D efforts from the volume of reserves discovered to the volume of gas produced during the year.

The ratio of findings to production vary from year to year. These ratios for gas-well gas were 122 percent in 1960, 155 percent in 1961, 180 percent in 1962 and 122 percent in 1963, while the weighted average of findings of all gas was 127 percent of production for the years 1960 through 1964. The appropriate ratio for these purposes is a matter for careful judgment rather than scientific formula.

We recognize that what the industry has been spending is not necessarily the desirable expenditure in the public interest. We believe, however, that the level of recent expenditures represents an appropriate basis for determining the ratio which should be adopted. In applying judgment we conclude that the ratios for gas-well gas are the more significant, but they must be discounted in view of atypical results for 1962. If the 1962 figure is brought down to the level for 1961, the four-year average becomes 138 percent. These figures point to an adjustment figure in the range of 35 to 40 percent. In these circumstances we shall utilize the 37 percent figure adopted by the examiner with which all parties have concurred. We believe such a ratio provides a necessary adjustment of the allowance for E&D for new gas-well gas to permit a level of findings reasonably in excess of production. Applying this ratio to the 3.01 cents per Mcf for E&D results in an additional 1.11 cents per Mcf allowance.

The examiner reached a similar result although he associated his allowance, which he termed an "allowance for growth", with a precise reserve-production ratio for the future, a rationale which we cannot accept. However, as we have explained, we are satisfied that his conversion factor approximately represents the recent history of findings and is an appropriate conversion factor to permit the recovery of the cost of exploration and development during the year incurred.

The Major Producer Group's exception on this point, which is based on a contention that the ratio of reserves to production should be increased to 20 to 1, is denied. See *supra*, pp. 183 to 185.

Summary of Exploration and Development Costs

The exploration and development allowance which we here provide as a component of the cost of new gas-well gas will permit the industry to recoup from current production all costs presently being incurred in a satisfactory level of exploratory effort. In effect we have found that the industry is now spending approximately 4.12¢/Mcf for exploration and development computed on the basis of the total production of new gas-well gas. Our allowance for E&D provides the industry with the funds to continue the same ratio of E&D in relation to volumes produced.

PRODUCTION OPERATING EXPENSE

On the basis of testimony by Witness Roseman on behalf of the California Distributors, the examiner found that a cost of 2.88 cents per Mcf was proper for production operating expense. Witness Park, presented on behalf of Texaco Inc., testified that the amount should be 2.62 cents per Mcf, or 0.26 cent lower. Both Park and Roseman derived their figures from the data on nationwide production costs received by this Commission in response to the questionnaire circulated to Permian Basin producers.

The basic differences between Roseman's and Park's results are two-fold. The first is that in the allocation of overhead expenses Roseman used direct lease cost and expenses, including depletion, depreciation and amortization (DD&A). Park, on the other hand, used direct lease costs and expenses, but excluded DD&A. We find that Park's exclusion of DD&A was proper for the reasons set forth in discussing this issue in connection with flowing gas in Appendix C, p. 296.

The second difference is that Roseman made an adjustment of the production operating cost to reflect national production of condensate and gas, rather than relying strictly on the questionnaire data for production of condensate and gas. His justification for such adjustment, which the examiner adopted, was that the respondents filing questionnaire data produced a disproportionately large amount of lease condensate in relation to their gas production. (They produce one-half of the national lease condensate but only one-third of the national gas-well gas.) Park did not make such an adjustment. We agree with Roseman that this adjustment should be made because of the disproportionate production of condensate. We adopt Roseman's production operating expense allowance but modify it to reflect the proper overhead allocation. Making this modification, the production operating cost is 2.70 cents per Mcf.

ADJUSTMENT OF NET PRODUCTION TO MARKETED PRODUCTION

The examiner included no special item in his cost computation to reflect the costs of gas produced but not sold. Witness Park included a 5-percent adjustment which he said was to compensate for waste, for venting, and for gas consumed on the producing property. The Major Producer Group contends that there should be at least a 2-percent adjustment. The annual reports of the Texas Railroad Commission and the Louisiana State Conservation Commission for 1960 show that in these states, which produce 75 percent of the nation's gas-well gas, less than one-tenth of one percent of the gas was vented and wasted.

We agree with the examiner for the reasons stated at pp. 384, 385 of his opinion that there is no justification for making any allowance for the negligible amount of gas vented or wasted.

NET LIQUID CREDIT

When gas is produced some of the entrained liquids may condense while the gas is being lifted or shortly thereafter, and some of the liquids may be extracted by processing operations. The producers often receive substantial revenues from the sale of the liquids independently of the price they receive upon sale of the gas, and such liquids are an important item of commerce. Witness Roseman, on behalf of California Distributors, and Witness Park, on behalf of Texaco Inc., both credited the revenues received by gas producers from the liquids contained in the gas to the cost of finding and producing the gas. The Major Producer Group now contends that no liquid credit should be adopted. Staff, on the other hand, has excepted to the examiner's determination that the proper amount of the liquid credit is 2.68 cents per Mcf, net, after royalties and production taxes are deducted, and contends that the proper amount for new gas-well gas is 3.27 cents per Mcf.

As to the basic issue whether it is appropriate to credit the cost of gas with the liquid revenues, we adopt the examiner's views as follows:

> The logic of crediting the revenues from the liquids is that the producer can reasonably expect that, from a proposed expenditure in the generally directional search for and production of gas-well gas, he will receive revenue from the liquids as well as from the gas. Thus he may count against his prospective total cost the expected revenues from the liquids. The remainder

represents the revenues to be derived from the gas if the total costs are to be met, and is the cost burden that has to be borne by the gas. Since the price of lease condensate has been relatively stable in recent years[11] and since the credit amounts to only sixteen percent of the price for new gas-well gas adopted herein, it is not likely that changes in the price of condensate will produce significant swings in the price of gas. In these circumstances, crediting the liquids is reasonable for the purpose used here. (Initial Decision, Appendix B, pp. 387, 388.)

[11] Average prices for lease condensate were: 1954, $3.01 per barrel Census; 1958 $3.05, Census; 1960 $3.03, Appendix B.

The producers' argument to the contrary is essentially that since the Commission does not regulate the sale of liquids it is improper to credit revenues. This is equivalent to saying that oil-well gas should be priced at the total cost for both oil and gas because we do not regulate oil prices. The argument has been rejected by the courts with respect to crediting of liquid revenues extracted by pipelines.[20]

Witness Roseman's testimony and the presiding examiner's determination as to the amount of the liquid credit were based upon published statistics of the American Petroleum Institute (API) and the "Oil and Gas Journal." The gross credit is derived by multiplying the condensate production from gas-well gas by the price received for the liquids and dividing this amount by the total gas-well gas production for the year in question. Using the "Oil and Gas Journal" production figures, the examiner concluded that 3 cents per Mcf is a reasonable estimate for the gross lease liquids credit from which he deducted royalty of 12.5 percent and production tax to obtain a net credit of 2.48 cents, exclusive of plant liquids revenue which we shall treat separately.

All of the statistical series point to the conclusion that there has been an increase in condensate production from gas-well gas since 1960, a rate of increase which is greater than the rate of increase in finding and producing gas. The fact that the increase in condensate products has outstripped the increase in gas-well gas production reflects the richer content of liquids in the new gas-well gas which is being discovered and the improved separation techniques developed by the industry. The examiner by basing his credit exclusively on the liquid to gas ratio in current production has not taken into account this trend in condensate production. Since we are here concerned with a ceiling price to apply to new gas-well gas, the liquid credit we allow must reflect current and expected experience. We believe that a figure based upon the respondents' responses to the Commission's questionnaire is more nearly representative of current trends. Witness Park determined a gross credit of 3.71 but as was explained with regard to production operating expenses (*supra*, p. 194) we agree with the examiner and Witness Roseman that the questionnaire data from which this figure was derived by Witness Park was not fully representative of industrywide production. The questionnaire data reflects a larger production of condensate on a unit basis than do the nationwide statistics. Accordingly, in our judgment, the 3.71 cents per Mcf gross liquid credit should be adjusted downward to reflect this distortion. We believe that taking all facts into consideration the proper gross liquid credit should be 3.50 cents per Mcf. This credit is based upon production which is well within the range of published statistics for 1960 and is in line with the trend in later years toward increased realization of condensate per Mcf of gas.

[20] *Panhandle Eastern Pipe Line Co.* v. *F.P.C.*, 324 U.S. 635, 646 (1945); *Cities Service Gas Co.* v. *F.P.C.*, 155 F. 2d 694, 703 (CA10–1946); *Panhandle Eastern Pipe Line Co.* v. *F.P.C.*, 305 F. 2d 763, 767–768 (CADC–1962), cert. denied, 372 U.S. 916.

The gross figure of 3.50 cents after deduction of production taxes and royalties leaves a net liquid credit of 2.90 cents, not including plant liquids, which we here adopt.

In addition to liquids extracted at the well, gas-well gas is also processed at stripping plants. Producers usually share in the revenues from these plant liquids on a percentage basis. Witness Roseman testified that if the producer receives only 20 percent of the liquid revenues it would amount to 0.4 cent per Mcf of gas-well gas produced. The California Distributors and Texaco, who sponsored Witness Park, stipulated that for purposes of this case a credit for plant liquids in the range of 0.1 cent to 0.2 cent per Mcf of gas-well gas produced could be used. In light of Witness Roseman's analysis and the trend of richer liquid content which the record reveals we shall adopt the examiner's conclusion that the upper range of the stipulation, 0.2 cent per Mcf, should be accepted as an appropriate plant liquid credit.

The addition of 0.20 cent per Mcf to the 2.90 cents per Mcf net liquid credit gives a total liquid credit of 3.10 cents per Mcf.

REGULATORY EXPENSE

Neither Witness Roseman, for the California Distributors, nor Witness Park, for the Major Producer Group, included in the computation of costs any amount for regulatory expense. The presiding examiner, however, included in his computation an item of 0.14 cent per Mcf for regulatory expense, based on data derived from answers to the questionnaire. Since it appears to be a reasonable estimate and no participant disputes its inclusion, it will be accepted.

DEPLETION, DEPRECIATION, AND AMORTIZATION OF PRODUCTION AND INVESTMENT COSTS

Production investment costs include successful well costs, lease acquisition costs and cost of other production facilities. These items were capitalized by the presiding examiner, and we agree. The total of these items will establish the rate base on which a return must be allowed. The amount of the rate base itself must be recovered by the producers by charges for depletion, depreciation and amortization over the period of the economic life of the investment. The procedure we use is to convert DD&A to an Mcf basis and to add an element for return on the production investment per Mcf. We shall discuss separately each item involved in the calculation.

Successful Well Costs

The examiner found that successful well costs amounted to 2.88 cents per Mcf of gas found. He determined this amount by dividing the cost per foot of successful wells drilled in 1960 by the average of gas reserves added per foot of drilling in a year. The drilling cost per foot was derived from data in the U.S. Bureau of Census, Census of Mineral Industries for 1958, adjusted to 1960 on the basis of the questionnaire data. The total reserves added were derived from the AGA proven reserve statistics.[27]

The Major Producer Group first argues that the Joint Association Survey (JAS)[28] cost per foot of well drilling should be used in place of the 1958 Census data as trended to 1960. In the alternative, they urge that if the 1958 Census

[27] Identified in this proceeding as Bureau of Mines "Minerals Yearbook," Vol. II (which is a reprint of the AGA data). The footage used with this data was obtained from "World Oil" magazine.

[28] The JAS is a survey by three industry trade groups and is based on a questionnaire mailed by these groups to all their member companies.

cost is used, this cost should not be adjusted downward on the basis of the questionnaire data to arrive at the 1960 cost. They conclude that the successful well drilling cost should be computed at 3.10 cents per Mcf of gas reserves added, rather than 2.88 cents as computed by the presiding examiner.

We agree with the presiding examiner that the JAS statistics should not be used to decide this issue. The presiding examiner has pointed out that the companies included in the JAS were not selected on a random basis, and that filling out and returning the JAS questionnaire was voluntary. The results thus reflect a considerable amount of self-selection. Due to the method of selection there is no assurance that the sample is characteristic of the industry as a whole and it should not be used in preference to the 1958 Census, even though cost based upon the 1958 Census was adjusted by trending to determine the comparable 1960 cost.

In our discussion of dry-hole costs we have already dealt with the question whether cost derived from the 1958 Census may properly be trended on the basis of questionnaire data to determine comparable 1960 costs, and affirmed the examiner on this point. We believe it is not only appropriate but necessary to make the same adjustment in this connection. The exceptions in this regard will therefore be denied.

Lease Acquisition Costs

Witness Roseman, on behalf of California Distributors, computed lease acquisition costs at 0.76 cent per Mcf for gas found. In common with all other witnesses on this subject, he determined the cost per Mcf of lease acquisitions on the basis that such cost is directly related to successful well drilling cost. He found that the appropriate figure was 26.4 percent on the basis of data collected in a survey by the Chase Manhattan Bank and data contained in the 1958 Census.

The presiding examiner accepted Roseman's computation of 0.76 cent per Mcf. The Major Producer Group excepts to this finding, and contends that Witness Park's computation of 1.15 cents per Mcf should be used. Park computed his figure on the basis that lease acquisition cost is 40 percent of successful well cost per Mcf.

We agree with and adopt the presiding examiner's analysis of this question set forth in Appendix B to the initial decision, pp. 379–382. The adopted portion, together with an additional analysis reinforcing our conclusion here, is set forth in Appendix B to this opinion.

Cost of Other Production Facilities

The examiner approved 0.31 cent per Mcf for this item which includes lease equipment, related lease facilities and apportioned overhead investment. The 0.31 cent figure is supported by the testimony of Witnesses Roseman and Park, but for different reasons. Witness Park's recommendation was an integral part of a broader presentation which we have not accepted and for that reason we rely on the testimony of Witness Roseman. In substance, Witness Roseman's testimony is that the respondent's gross investment in these items approximates 8½ percent of the gross investment in leases and wells attributable to nonassociated gas, and that a comparable percentage of the previously determined lease and well costs should be allowed for these items. We find the amount to be reasonable and we shall affirm the examiner's finding on this point.

Allowance for Growth in Investment

The Major Producer Group contends that in his computation of production investment costs the presiding examiner should have included an allowance to reflect future increases in investment. We believe the examiner correctly excluded such an adjustment. Production investment costs are capitalized and

recouped, with a return realized from the sale of gas over the period of the life of the investment. This investment is stated in terms of an amount per Mcf of gas found. While the total investment may grow, there is nothing in this record to support a conclusion that there will be an increase in the amount invested per Mcf of gas found. Accordingly, we believe there is no basis for any additional amount as an allowance for growth in production investment costs.

Period of Recovery of Investment

A return must be allowed upon the investment for the average period of recoupment. Having determined the total production investment cost to be 3.95 cents per Mcf, the presiding examiner then estimated that the average period required for return of each dollar of that investment will be 10 years after the resulting gas begins to flow. He reached this conclusion by assuming that the gas will be totally depleted in 20 years, the normal life of a contract, and that the depletion will take place in an equal amount each year. The Major Producer Group and The Superior Oil Company contend that the true period of depletion is at least 22 years, and that this period rather than 20 years should be the basis of calculation.

These respondents are correct in pointing out that the period of well depletion is somewhat longer than 20 years. More than offsetting, however, is the fact that wells are not depleted uniformly over their producing life. They produce a greater output of gas and condensate during the first years of depletion. Production usually begins to decline some 7 to 12 years after the well begins to flow until, during the last years of depletion, the well is producing only a fraction of its flow in earlier years. While exact figures are not available, it appears that the additional years of minimal production, not included in the examiner's computation, are more than offset by his computing depletion at an even rate rather than taking into account the higher production in early years and the greatly lowered production at the end of the period. Accordingly, the exceptions on this point will be denied.

Lag

Some of the production investment costs must be made in advance of the time that gas begins to flow. Lease acquisitions are often made a substantial time in advance. Expenses for successful wells must be incurred before any gas can be produced. To allow for this lag between investment and first realization of revenue from sale of the resulting gas, the presiding examiner allowed 1 year of so-called "lag time" in addition to the 10-year period in which the average dollar of investment will be recouped after production begins.

The California Distributors urge that no lag period be included. They contend that the investment of funds before gas begins to flow is more than offset by the fact that some of the investment is not made until after gas has been in production for some time. They refer to this as "negative lag."

The Major Producer Group, on the other hand, contends that the lag should be from 3 to 5 years, and that the 1-year period allowed by the examiner is insufficient.

While it is generally conceded that a time gap does exist between the outlays for some productive investment and the initial receipt of income, the evidence in the record is general and vague insofar as it concerns a specific time period. Moreover, this general testimony is offset to a certain extent by the evidence of investment which does not take place until gas has been in production and evidence that some items will be used for only part of the time in which a return will be allowed. There is no precise computation of the average amount of expenditures involved in either the lag or the "negative lag," or of the amounts

of time by which these expenditures precede or follow the date when gas begins to flow.

Geological and geophysical expenses and exploratory overhead, both of which may be expended several years before a well begins to produce, are not ordinarily accounted for as part of production investment costs. They are part of exploration and development costs which are treated as expenses by the producers in the year in which they are incurred. Successful well drilling costs are approximately 73 percent of the production investment costs. These would ordinarily be incurred within the one-year lag before gas begins to flow which the examiner has allowed. Lease acquisition costs may occur earlier, but these are little more than 19 percent of the total production investment costs. The cost of other production facilities, which is approximately 8 percent of the total production investment cost, as here determined, would be incurred largely within the one-year lag period.

Taking into consideration the evidence of both the positive and negative lag, we believe that the presiding examiner's determination on this point should be upheld.

RETURN ALLOWANCE

Rate of Return

Respondents urge the adoption of a rate of return in the range of 16–18 percent on average net investment. In support, they refer to returns previously allowed in producer and pipeline litigation and to the traditional and current earnings experience of numerous industrial and utility categories. Respondents' principal argument is that the risks inherent in exploration are voluntarily incurred and extraordinary and they must be recompensed in the rate-making process. They also argue that the discounted cash-flow analysis is the keystone to the producer return issue. The producers also stress the time lag between investment of funds and receipt of income.

Staff, joined by the California interests, presses for a 9½ percent return on average net investment which translates into 10½ percent on common equity. Staff offered extensive testimony which focuses heavily on the earnings experience of integrated producers, who supply the bulk of the natural gas production. Staff supports its reliance on the experience of the integrated producers partly by claiming there is no proof that their nonproduction departments are less risky than their production departments. Staff recognizes the geological risks inherent in exploration but considers them to a degree offset because of the producers' alleged ability to avoid income taxes, their low-debt capital structure, and the opportunity, implicit in group regulation, for low-cost producers to achieve higher than average returns. For these reasons, Staff concludes that a return must be set in this proceeding which is somewhat lower than that which would be deemed appropriate in the context of individual regulation.

In determining an appropriate rate of return, the Commission must operate within long-accepted judicial guidelines. Many of them, although established in the context of individual company regulation, apply with equal validity to the *en masse* regulation we have adopted herein. Simply stated, the courts have consistently held that the return must be sufficient to attract new capital, be in line with that earned by comparable industries, *e.g.*, *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591 (1944); *Bluefield Water Works and Improvement Co.* v. *F.P.C.*, 262 U.S. 679 (1923), and most significantly, be determined, not through the automatic application of formulae, but through informed judgment taking into account all relevant facts, *e.g.*, *State Corp. Commission of Kansas* v. *F.P.C.*, 206 F. 2d 690 (CA8–1953), cert. denied, 346 U.S. 922 (1954); *Washington Gas Light Co.* v. *Baker*, 188 F. 2d 11 (CADC–1950), cert. denied, 340 U.S. 952 (1951).

As a starting point in our analysis, we turn to the financial requirements and experience of a sector of the gas industry with which years of regulation have made us familiar, the natural gas pipelines. The transmission sector is an immediate adjunct of production, and the two have evolved contemporaneously. An examination of recent transmission company rate proceedings indicates that representative companies are currently being allowed returns on net investment in the 6.0–6.5 percent range, with the preponderance between 6.25–6.5 percent. While we have recently been emphasizing the overall return, it is instructive that a 6.25–6.5 percent return on transmission net investment translates, considering current capitalization patterns, into a yield on equity of from 10.0 to 12.0 percent. Although this yield is by no means dispositive of the issue before us, it places the issue of an appropriate rate of return for gas production in a more meaningful context, especially in view of the fact that producers generally are 85 percent equity companies. In addition, production operations inherently involve a greater degree of risk than the transportation of gas.

The difference in the degree of risk is highlighted by the fact that the construction and operation of transmission lines are authorized only upon the issuance of certificates of public convenience and necessity, and these, in turn, require a showing of economic feasibility. *Northern Natural Gas Co.*, 28 FPC 1155 (1962). By contrast a producer who is exploring for new gas is relying largely on the law of averages, especially under the area rate approach.

Transmission companies generally have assured sources of supply, traditionally under at least twenty-year contracts. They are generally able to shift to their purchasers the burden of their costs, and they have a minimal labor problem. Considering these factors, together with the projected continuation of a 3.5 percent growth in consumer demand, the 6.25–6.5 percent overall return and the 10 to 12 percent yield on equity for pipelines can be considered as applying to a relatively safe investment, at least by comparison with gas production.

In comparing the allowable returns on production with the returns previously allowed in transmission proceedings legal precedent and financial requirements dictate that if unusual risks are inherent in production, a greater return should be allowed on investments therein in the absence of record evidence to support a different conclusion. See, *e.g.*, *F.P.C.* v. *Hope Natural Gas Co.*, *supra*; *F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bluefield Water Works and Improvement Co.* v. *F.P.C.*, *supra*; *Wilcox* v. *Consolidated Gas Co.*, 212 U.S. 19 (1909). It is beyond question that the business of exploring for natural gas and, to a lesser extent, its production, is fraught with uncertainties foreign to its transmission. Justice Jackson pointedly expressed this fact in his oft-quoted dissenting statement in the *Hope* case, and the Commission has repeatedly recognized it. Thus, we said in *Phillips:*

> Is is clear that the risks of this business [exploration and development] are greater than those of an electric utility or natural gas pipeline. 24 FPC at 572.

We have also noted the special risks involved in production operations:

> The producer must invest his funds prior to ascertaining whether he will have anything to sell or whether, if he does, he will have an adequate market. *Id.* at 543.

And later in *CATCO:*

> We are fully cognizant of the risks of drilling for gas and the need to encourage continued exploration and production. 27 FPC at 106.

And still later in *Southern Natural Gas Co.*, 29 FPC 323, 336 (1963):

> It is well recognized that a series of dry holes or even a single dry hole may bankrupt an independent producer, and it is equally well recognized

that an independent producer who has the misfortune to discover high-cost gas may very easily find it impossible to dispose of such gas at a price which returns more than a small fraction of his costs of discovery and development.

The principal uncertainty lies in finding gas in commercial quantities, and is emphasized by the record evidence that producers, while seemingly able to a degree to direct their searches for particular hydrocarbons, have no assurance that any hydrocarbon will be found. The risk of a dry hole—or noncommercial well—is one that has characterized the production activity since its inception. That the risk is not merely theoretical is borne out by the questionnaire data compiled in Staff exhibit 142 which reveals that Permian respondents in 1960 spent approximately $212,342,000 on geological and geophysical expenses, $114,284,000 on lease rentals and $271,576,000 on dry holes. While it is true that in the aggregate we allow these costs as an operating expense, the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for each individual producer and it must be recognized in the rate-making process.

There is another risk in the production operations which our allowance for rate of return in this proceeding must reflect—the risk of finding gas of less than pipeline quality. The record reveals that the greater percentage of the gas in the Permian Basin does not fully meet the pipeline quality standards prescribed herein. The details respecting quality adjustments are discussed *infra*, at pp. 221–225. While we have provided upward adjustments for new gas-well gas with above average Btu content, nevertheless there remains the risk that any gas found can be sold only at an adjusted ceiling price which involves a substantial discount from the ceiling prices for gas of pipeline quality prescribed herein. Such risk is a special factor that must be considered in establishing the rate of return for the Permian Basin.

Agreeing that production operations involve risks which must be recognized in our allowance for rate of return, yet we conclude that the risks are not as great as the producers claim. The producers' case for a 16–18 percent rate of return ignores the fact that there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves. The producers statistical support for a 16 to 18 percent return rests on data that contain conspicuous infirmities. As pointed out by the examiner, Witness Morton's statistical presentation contains only one instance of an 18 percent rate of return on capitalization. We affirm the examiner's conclusion that Morton's sample is unrepresentative.

The return producers seek is greatly in excess of the recent earnings experience of even the nonintegrated producers. It is three-fold the return allowed on transmission investments and it would produce a yield on common equity of approximately 20 percent. Such a return is neither typical nor necessary, and must be rejected.

We have already discussed the "true yield" method for determining capital cost which expresses the discount rate equating the value of a stream of future revenue with the cost of the initial investment generating that stream. It is employed herein by the producers to demonstrate the earnings rate disparity between it and the conventional method which allows a return on net investment. The witness advancing this unconventional approach has merely urged that the disparity between book yield and "true yield" be recognized in a larger return allowance and provided little in the way of support for the application of his alternative method. In these circumstances, his approach cannot be used in resolving the rate of return issue in this case.

We now turn to the earning experience of the production industry to fix the return to be allowed in this proceeding. Staff witness Shaffner's Exhibit 176 analyzed in Schedules 11 and 12 the 1957–1961 rates earned by two classes of producers: those that were principally engaged in production, and those that were also engaged in refining and marketing. The schedules, based on "Moody's Industrials and Annual Reports to Stockholders," were limited to companies with interstate sale to pipelines in excess of 2,000,000 Mcf annually, with actively traded common equity, and with a policy of making periodic reports of their earnings posture.

The staff Exhibit 176, Schedule 11, reveals that the average returns for nine companies confined to production functions in each of the years 1957–1961 were, respectively, 13.9, 10.9 (including an .8 percent return for one company), 12.4, 11.6, and 13.2 percent, which produced an average of 12.4 percent, and a five-year median of 10.9 percent. When only the experience of the seven Permian producers is reflected, the returns for the same years are as follows: 15.0, 12.4, 13.9, 12.5 and 13.4 percent, making an average of 13.4 and a median of 11.3 (Exhibit 176, Schedule 12). These staff figures are consistent with respondent witness Morton's Exhibit 220, showing that 13 producers engaged solely in production, including six not covered by Exhibit 176, earned for these years 16.4, 13.7, 15.0, 13.0 and 14.4 percent over the same period. This produced an average return of 14.5 and a slightly lower median of 14.4 percent.

Both the staff exhibits and the presentation of Witness Morton were limited in the number of individual companies covered; the latter also employed subjective considerations in selection and was forced to report on a less comparable basis. Nevertheless they are the best record indication of what the production function traditionally returns. We conclude that they are entitled to heavy consideration in the decisional process in this case.

Witness Shaffner's second category was comprised of 26 integrated producers. The average return experience for these companies was 10.0, 7.9, 8.1, 8.2, and 8.2 percent for the indicated years, which gave a five-year average of 8.5 percent and a median of 8.1. When limited to the 24 integrated Permian producers, the figures decreased slightly: 9.9, 7.8, 8.0, 8.0, and 7.8 percent, for a five-year average and median of 8.3 and 8.1 percent, respectively. On a general average basis, the resulting return was 9.5 percent for both the national and Permian producers. On an average weighted by capitalization basis, both national and Permian-only, the resulting return was 9.3 percent, reflecting that the total capitalization for the 26 integrated companies was over 40 times that of the nine nonintegrated companies.

The Shaffner study of the returns of integrated producers standing alone fails to make a persuasive showing that the results are the best evidence of the financial needs of the gas operations of the companies involved. It covers the most widely diversified segment of the industry, those whose revenues were derived from the sale of petrochemicals, fertilizers, plastics, and gasoline, as well as from transmission, distribution, real estate, and manufacturing enterprises. The exhibits in the record, and the sources upon which they are based, offer no ratio of the integrated company oil and gas production revenues to total revenues, although they do reveal that revenues generated by natural gas sales to pipelines accounted for but 2.22 percent of total revenues. Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns. It may be that on a different record the returns of integrated producers may be shown to be highly relevant but without any assurance that production returns approximate overall returns, we cannot automatically attribute the latter to the former. Accordingly, while we are

persuaded that integrated producer returns are relevant to the instant issue, we are not persuaded that the Shaffner exhibit sufficiently weights production operations in his recommended return of 9.5 percent.

After weighing all the evidence on the issue we believe a return of 12 percent is appropriate in light of the considerations previously discussed and the presentations in this case, particularly the testimony of witnesses Shaffner and Morton with respect to the returns by nonintegrated producers in the Permian Basin. A return of 12 percent on production activities protects gas consumers against excessive prices but it is not so low that it fails to respond to the needs of the industry. It also considers the needs of the smaller independent who traditionally drills much of the Permian exploratory footage and has limited resources to weather even a brief series of unproductive expenditures. It may be that another result may be reached on a different record but in this first area rate proceeding we believe the record points to a return of 12 percent and it is therefore adopted.

The presiding examiner, having determined that the total production investment would be recouped over an average period of 10 years beginning an average of 1 year after investment, correctly concluded that the total return to be allowed on each Mcf of gas should be based on an investment base that is 11 times the production investment per Mcf found. As the production investment was found to be 3.95 cents per Mcf, the investment base here is 43.45 cents. The annual return per Mcf should be computed by multiplying 43.45 cents by the 12 percent rate of return, producing a figure of 5.21 cents per Mcf.

Return on Working Capital

To the return on net investment must be added the return on a working capital allowance. While in this proceeding the return on the allowance is a small item, it raises a policy question for decision.

Distributor witness Roseman presented a working capital computation in Exhibit 224 which follows the traditional utility formula of allowing in the rate base for a 45-day lag in collections; that is, a return is allowed on the sum of one-eighth of annual production operating expenses, one-eighth of annual exploration expenses, and amounts invested in supplies, materials and prepayments allocated to the exploration and production functions. The resulting allowance is 1.63 cents per Mcf which, at a 9½ percent rate of return, gives a 0.16 cent return. The presiding examiner accepted the method but, substituting 12 percent, allowed a 0.20 cent return.

The producers contend that the utility formula is inappropriate for the producing industry because it excludes funds that must be kept available for lease plays, drilling failures and exploration. They point out that their ratio of net plant to total capitalization is far smaller than in the transmission industry, and consequently, recurring cash needs, which are not covered by the return on net investment, become more significant. The producers advocate a "balance sheet formula" which would allow a full return on the current net assets. They conclude that a representative allowance would be either 23 percent of total capitalization, which is the ratio of actual working capital to total capitalization for the thirteen non-integrated producers covered in their Exhibit 220, or 17 percent, which purportedly represents the ratio found in the Chase Manhattan Bank 1960 study of the actual cash portion of current net assets to net plant for the integrated companies. The Staff reply brief, however, correctly points out that the actual cash portion is but 6.7 percent, the other 10.3 percent representing marketable securities.

Staff and the distributors attack the balance sheet formula. They contend that it inappropriately allows a return on such items as total cash on hand,

marketable and capitalized securities, accounts and notes receivable, and—in the case of the integrated producer—current assets applicable to refining and marketing. They argue that because net current assets have no reasonable relationship to the function of the working capital allowance, the balance sheet formula has been uniformly rejected by this Commission and the Courts. Staff concludes that the Commission has regularly employed the utility formula for producers and that other sources assure the availability of sufficient funds. Consequently, no further allowance is appropriate.

The Commission was first presented with a balance sheet approach in *Cities Service Gas Company*, 3 FPC 459 (1943), where it rejected the method as being "* * * unsound and inherently fallacious for ratemaking purposes." 3 FPC at 478. The case was affirmed, 155 F. 2d 694 (CA10), cert. denied, 329 U.S. 773 (1946). The Commission reaffirmed this conclusion in *Northern Natural Gas Co.*, 11 FPC 123 (1952) and the reaffirmance was specifically upheld in *Corp. Comm'n of Kansas* v. *F.P.C.*, 206 F. 2d 690 (CA8–1953), cert. denied, 346 U.S. 922 (1954). The method was also rejected in *Panhandle Eastern Pipe Line Co.*, 13 FPC 53 (1954), rev'd on other grounds, *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (D.C. Cir. 1955). The balance sheet approach now urged upon the Commission incorporates the same flaws as found in the previous versions of this method. As herein presented, it is insufficiently refined and meaningful to be a legitimate regulatory formula, and we see no reason to depart from the sound reasoning of the *Cities Service* decision.

We are convinced that the balance sheet approach must be rejected and conclude that the four additive factors in the utility formula—cyclical expenses, materials, supplies and prepayments—are justified components of a working capital allowance for the producing industry, and that the formula is appropriate for calculating these factors. We appreciate, however, that the erratic nature of individual company lease acquisitions, the competition among producers for attractive leaseholds, and the established practice of the industry to generate its own capital, demand that additional liquid sums be kept available. Accordingly, a compensatory "lease play" return must be allowed on reasonable amounts in excess of the working capital allowance based on the traditional utility formula.

Such funds in reasonable amounts are not idle or dormant in a meaningful sense. They are being employed as the exigencies of the business demand: in ready reserve for expenditures upon which the contribution of the industry depends. Such funds are not surplus, because they could not be dissipated without adverse effect on the exploratory effort. Moreover, there is no likelihood that they will be retained merely to inflate rate bases. Producers are relatively assured of receiving a return on funds invested in securities, and they have a fair opportunity of receiving a return on funds invested in the producing industry. Perhaps the most persuasive reason why excess sums are unlikely to be retained is that producers reduce their tax liabilities by a continued investment in the industry; the depletion allowance, by law, can offset no more than 50 percent of net income from a productive lease. This immediate tax benefit accruing from reinvestment far outweighs any incentive to mere accumulation.

We find that the producers must be given a return on the funds retained for lease play in addition to the 0.20 cent per Mcf return allowance computed under the traditional utility formula. An exact amount for this additional allowance is difficult to determine from the present record. Presuming that the producers should be allowed a return on liquid funds on hand equivalent to one and one-half times their per Mcf expenditures for lease acquisitions,

return on the allowance for lease play would be approximately 0.15 cent per Mcf.[29] Future proceedings may elicit a more precise method for computing this amount.

For the purposes of this case, 0.15 cent per Mcf will be added to working capital as a lease play return allowance, making the total return on working capital 0.35 cent per Mcf.

ROYALTIES

Both Witness Roseman and Witness Park included royalties at the rate of 12.5 percent in their computations of cost. The presiding examiner accepted this figure and no participant demurs to the inclusion of such an item or to the 12.5 percentage. The examiner's figure of 2.11 cents per Mcf will be adjusted to 2.05 cents per Mcf to reflect the changes in the total amount on which the 12.5 percent royalty is computed.

PRODUCTION TAXES

The present Texas production tax is at the rate of 7 percent of lease revenues. Production taxes in New Mexico are somewhat lower than in Texas. The presiding examiner used a weighted average of Texas and New Mexico production taxes, which he computed to be 6.42 percent after taking into account the latest increase in New Mexico taxes.

We think that reasonable local taxes are a valid basis for a difference in ceiling prices between one area and another and if reasonable the tax applicable in each state should be applied to the gas produced in that state. The 7 percent tax in Texas is at approximately the maximum level of taxes which we have allowed to be passed on by the producer to the purchaser. Accordingly, the full amount of taxes actually incurred either in Texas or New Mexico will be allowed as a component of the total price per Mcf of gas. Since the greater part of gas produced within the Permian Basin is subject to the jurisdiction of the State of Texas, all ceiling prices set forth in this opinion will be stated in amounts applicable to gas produced within the taxing jurisdiction of that state. However, the ceiling price for sales in New Mexico will reflect the applicable tax in that state and will, accordingly, be at lower levels.

In the event of any increase in taxes in Texas or New Mexico, the Commission will consider whether ceiling prices shall be increased and, if so, to what extent.

The ceiling price here established will be the total amount to be paid by the buyer of gas, including all tax reimbursements provided by contract.

INCOME TAXES

Respondents presented no evidence that any income tax allowance should be included in the computation of cost of new gas-well gas. Their witnesses, Park and Keane, included no such allowance. As stated by the examiner, the testimony of Staff Witness Lyon shows that if the industry's growth is considered, there will be no Federal income tax liability at any return up to 15 percent. The Major Producer Group argues that 0.6 cent per Mcf should be included in the cost computation, representing income tax liability upon a return at the rate of 12.5 percent based on testimony by Witness Roseman. However, Roseman qualified his calculation by stating that many major companies in the past have been found to pay no income taxes, and that there is no evidence that taxes would in

[29] As determined herein, the annual lease acquisition cost per Mcf is 0.76 cent. A lease play allowance based on a 12 percent rate of return on one and one-half times this 0.76 cent per Mcf amount would be .137 cents per Mcf.

fact be paid. He further indicated that his computations should be revised in the light of additional data which was never introduced into the record.

In these circumstances we think the analysis of Witness Lyon was properly accepted by the examiner and we affirm his conclusion on this issue.

THE RATE FOR NEW GAS-WELL GAS

As we have stated the basic standard for determining the price of new gas-well gas is the cost-finding technique we have employed herein. However, in determining the price for each particular area the Commission must, of course, consider other relevant factors in the area. The factors which are commonly considered in the design of rates include the impact of the prescribed rate on existing rate structures, the quality of the gas in the area, the historical prices in the area and other such factors.

The presiding examiner made two adjustments from his cost base on account of such factors in designing his ceiling price for the Permian Basin. Both were of major size. One was a downward adjustment of 1.25 cents in the ceiling price for new gas-well gas (his so-called "location factor") to reflect the fact that historically the average initial price for new gas in the Permian Basin has been lower than the comparable price in the 7 southwestern states.[20] The second adjustment was in the other direction and consisted of an addition of 1.0 cent as a so-called "gold standard" to reflect the fact that much of the gas in the Permian Basin was of less than pipeline quality and his view that such a premium should be permitted for pipeline quality gas.

We do not believe that either of these adjustments is appropriate. Rates should of course be designed so as to minimize any disturbances of existing pricing patterns to the extent possible consisting with the basic regulatory standards. However, nothing in the record in this case suggests that the ceiling prices we are prescribing for the Permian Basin require any such adjustments. No adjustment for "location factor," whatever that vague concept may mean, is required or is appropriate in this proceeding, either in the amount prescribed by the examiner or in any other amount.

As to the "gold standard" adjustment, we have made clear that the ceiling prices prescribed herein apply as true ceilings for gas of pipeline quality and we have accordingly prescribed standards of pipeline quality. These standards provide for both upward and downward adjustments in the ceiling price for new gas-well gas. The record is deficient as to the overall financial impact of these adjustments but in our determination of rate of return we have recognized that producers in the Permian Basin incur the risk that the gas they find and produce may not command the ceiling price. The absence of any definitive record support for a "gold standard" adjustment coupled with our reflection of the quality problem in fixing the rate of return satisfies us that area revenue requirements will be met.

In summary, when all of these factors are considered there is no justification in this area for any adjustment of a cost-determined ceiling price. We state again that the ceiling price we are here establishing is for the Permian Basin and that it is entirely possible that in other areas non-cost considerations may require adjustment of the cost figures in establishing the ceiling prices. We hold only that no such adjustments are required in the Permian Basin on the basis of this record. Accordingly we shall round off the cost determined price of 16.43 cents and prescribe a ceiling price for new gas-well gas of pipeline

[20] He used the seven southwestern states because figures for continental United States were not available.

quality in the Permian Basin at 16.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling in Texas includes a production tax of 1.01 cents, which we round off to 1.0 cent, leaving a rate less production taxes of 15.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 15.5 cents at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. These prices will apply to residue gas derived from new gas-well gas (see discussion, *infra*, pp. 210–212).

RATIONALE FOR A UNIFORM CEILING PRICE FOR FLOWING GAS

Casinghead Gas

Casinghead gas is the common name for gas produced from oil wells in conjunction with the production of oil. For purposes of the application of our ceiling prices herein, we shall follow the existing classification of casinghead gas by the appropriate State agency. Casinghead gas is often higher in Btu content than either residue or gas-well gas, and usually contains valuable liquids which are extracted before the gas is delivered to a pipeline. Casinghead gas is often delivered at low pressures, sometimes as low as 5 psig. Since oil wells in the Permian Basin are subject to restraints imposed by State regulation upon the amount of oil produced, casinghead gas can be obtained from a given well only for the period each month that oil is under State oil production controls. Correspondingly, since oil is the major product of an oil well, taking the casinghead gas cannot be deferred for any length of time for the buyer's convenience; it must be taken at the time the oil is produced, and the amount of gas is related to the oil production. Accordingly casinghead gas is not subject to the exclusive control of the buyer as to time of delivery. Ordinarily, however, processing plants will schedule deliveries from the various wells which they service in such manner as to maintain a substantially even output, so that irregularities in deliveries from particular wells are overcome to some extent for the pipeline purchasers from the processing plants. Nevertheless, this limitation on the deliverability of casinghead sometimes requires the pipelines to draw on additional gas-well gas to meet their commitments, and gas-well gas sources therefore provide a valuable flexibility in meeting the peak requirements of the pipelines.

Most of the casinghead gas sold in the Permian Basin is sold to processing plants under percentage contracts, which provide that the processors shall pay to the producers a stipulated percentage of the price which the processors receive upon sale of the residue gas plus an agreed percentage of the proceeds of sale of the extracted liquids. Under these arrangements, the price paid by the processor is immaterial to the consumer so long as the price of the residue gas conforms with the ceiling price established for such gas in this proceeding. The processor is controlled by certificate and rate schedule filings and producers who sell casinghead gas under such percentage contracts are not permitted to file rate schedules with this Commission (Regulations Under the Natural Gas Act, Sec. 154.91(e)). So far as such producers are concerned, any separate ceiling price for casinghead gas would have no application.

The second major type of contract under which casinghead gas is sold in the Permian Basin is the so-called Spraberry or El Paso contract. These contracts provide for the purchase of casinghead gas by a pipeline which processes the gas, pays the producer a percentage of the proceeds from the sale of the extracted liquids, plus a fixed price for the residue gas delivered to the pipeline. The examiner held that the payment arrangements provided for in the Spraberry contracts must be discontinued. He fixed ceiling prices of 10 cents per Mcf for

old casinghead gas and 11 cents per Mcf for new casinghead gas, to be paid for the raw stream (including liquids) without any additional compensation to the producers in the form of a percentage of the liquids or of the price received for them. In effect, he outlawed the Spraberry contracts and declared that only a flat amount, limited by the separate casinghead gas ceilings, could be paid for casinghead gas purchased under the Spraberry contracts.

The Major Producer Group has taken strong exception to this ruling, contending that pipelines will not be able to purchase casinghead gas if the presiding examiner's proposal is implemented, because producers would then prefer to sell to the processors under percentage contracts. They also assert that the Commission has no jurisdiction over the division of the extracted liquids.

We believe the presiding examiner was correct in holding that the sale of the casinghead gas to the pipeline under the Spraberry type contract is subject to Commission jurisdiction, and that this Commission has the power to regulate the price for the raw gas purchased even though it may include the heavier molecules which can easily be liquefied. The form of the contract provides for the transfer of title to the gas as casinghead or raw stream gas but the method of payment is based upon a specified price per Mcf for the residue volumes of gas and a percentage payment of liquid revenues. The Commission has no jurisdiction over the price at which liquids are sold but if payment for the raw stream is made in whole or in part on the basis of a percentage of liquids or liquid revenues, the Commission may still consider the liquid credits in controlling the amount of the payment for the gas.

The fact that the transaction is subject to our jurisdiction does not mean, however, that we must reject a common form of contract which has been found useful in the industry. We believe that regulation should utilize industry practices developed by the parties to meet industry problems to the extent consistent with maintaining effective regulation. The Spraberry contracts govern approximately 20 percent of the gas sold in the Permian Basin, and we do not think they should be discarded unless it can be shown that they give rise to abuses or evasions, or result in unjust and unreasonable prices to consumers. So long as the cost to the pipelines for residue gas under the Spraberry contracts does not exceed the applicable ceiling price for gas of similar quality, we see no reason to require the elimination of the Spraberry contracts.

There is no evidence in this proceeding that the pipelines' cost of gathering and processing the casinghead gas purchased under Spraberry contracts is greater than the revenues realized by the pipeline from the liquids extracted. As long as the liquid revenues to the pipeline equal or exceed the processing and gathering costs the consumer will be adequately protected by the ceiling here established for residue gas. If the cost of gathering and processing exceeds the pipelines' liquid revenues by an amount which, if added to the price paid for the residue gas, would exceed the ceiling price applicable to residue gas of similar quality, and appropriate reductions of the price cannot be negotiated, the purchasing pipeline may petition the Commission for relief pursuant to Section 5(a) of the Act by ordering an appropriate reduction in the price the pipeline pays for such residue gas.

Aside from gas sold under percentage contracts and Spraberry type contracts, only a negligible amount of casinghead gas is sold in the Permian Basin. In 1960, only three such contracts involved sales in interstate commerce of Permian Basin casinghead gas to pipelines. These contracts involved total revenues of less than $200,000 in 1960. The impact of these contracts upon prices to be paid by the ultimate consumer is *de minimis*. The contract prices were all under 14 cents. Additional reductions in price for quality deficiencies would reduce the

actually realized prices still further. The effect of these contracts is too small to warrant the establishment of a separate ceiling price for casinghead gas.

Aside from percentage contracts, there are also few contracts for sales in interstate commerce of casinghead gas to producer-owned processing plants in the Permian Basin. These contacts will have no direct effect upon the cost to the pipelines and the ultimate cost to the consumer, since the resulting residue gas sold by the processing plants will be subject to the ceiling price herein established for residue gas derived from casinghead. In the event it should be determined that these contracts have a sufficient effect upon the cost of the processing plants so that the latter must seek relief before this Commission, we may then consider whether the prices under such contracts must be subjected to additional regulation. The record in this proceeding does not reveal the need for any such regulation. In general, the prices under such contracts are at sufficiently low levels so that the processors should be sufficiently protected. We establish herein a ceiling price for all gas (except new gas-well gas and residue derived therefrom) which will be applicable, of course, to such contracts.

We believe it is of great importance to simplify the system of area rate ceilings to the extent practicable consistent with an effective system of price controls. In this light we conclude that there is no need for a separate casinghead gas ceiling in the Permian Basin at this time. In the future, should the lack of such a ceiling be found to encourage evasions of the general price ceiling, a separate ceiling price for casinghead gas may be established. With respect to the Spraberry contracts and all other contracts which, in addition to a payment for residue gas, call for payment for a percentage of liquids or turning over a percentage of the liquids to the producer, any alteration in the price paid for the residue gas or the percentage of the liquids due to the producer will be considered a rate change which must be filed with this Commission and the right to make such rate changes will be subject to the moratorium on rate increases imposed herein. Future contracts embodying such provisions are to be certificated only where the liquid percentage to be retained by the processor or the pipeline equals or exceeds the cost of gathering and processing performed by the processor or pipeline, or where the price to be paid for the residue gas is reduced below the applicable ceiling sufficiently to offset processing and gathering costs in excess of the value of the liquids retained by the processor or pipeline. In the absence of a contrary showing, percentages similar to those now in effect will be assumed to be compensatory and will be approved in future contracts for comparable gas under comparable circumstances.

Residue Gas

Residue gas is the gas remaining after casinghead gas or gas-well gas has been processed to remove liquids present in the raw gas stream in the form of vapor or droplets. Only three to four percent of the residue gas produced in the Permian Basin is derived from gas-well gas; between 96 and 97 percent comes from casinghead gas.

Residue gas in the Permian Basin is delivered at somewhat lower pressures, on the whole, than is gas-well gas. Most residue gas is delivered at pressures below 800 pounds, but deliveries of gas-well gas at pressures of 1,000 pounds and up are not uncommon. The cost of raising the pressure of gas to a given point is not proportionate to the added pressure, but is determined by the number of stages of compression (and the compression ratio) necessary to create the desired pressure. To raise the pressure of gas from 600 pounds to 800 pounds

will normally cost little more than to raise it from 700 pounds to 800, since in each case only one stage of compression will be necessary.

For purposes of applying the area prices prescribed herein, the ceiling price for new gas-well gas will be applicable to residue gas which is derived from new gas-well gas and the ceiling price for all other gas will be applicable to residue gas derived from casinghead gas or old gas-well gas.

We regard our determination that all gas should be priced on the same basis as old gas-well gas (except for the top ceiling we have established to encourage the search for new gas-well gas which is applicable to such gas whether or not it has been processed) as an important step toward simplified and realistic area price regulation. It is apparent, on this record, that no realistic cost of oil-well gas either as casinghead gas or residue gas can be established and that the various apportionments of the joint costs of gas and oil, or gas and liquids, do not yield results which may be accepted as reliable guides. The evidence in this case and the practical administration of area prices dictates that casinghead gas, residue gas derived therefrom, and old gas-well gas, should be similarly priced. Unlike new gas-well gas, there is no basis on this record for differentiation because of the incentive effect, or otherwise.

The examiner would provide separate ceiling prices for old residue gas and new residue gas. We do not believe such a complication of the area pricing structure is necessary or desirable. We have already made clear that the higher ceiling price for new gas-well gas will apply in the case of residue gas derived therefrom. However, over 96 percent of the residue gas produced in the Permian Basin is derived from oil wells, not gas wells. It results from the search for oil, which will not be stimulated appreciably by a higher price for gas. There is thus little to be expected in the way of increased gas supplies from providing a higher price for such residue gas. All residue gas derived from oil-well gas, therefore, will be subject to the same ceiling price as old gas-well gas.

As stated above, we adopt the presiding examiner's finding that residue gas derived from new gas-well gas is to be subject to the new gas-well gas ceiling. If this were not the case, producers of new gas-well gas would be deterred from selling such gas to a processor from whom they were unable to obtain new gas-well gas prices. With equal prices, gas-well gas will be sold to a processing plant whenever the sum received for the liquids exceeds the cost of processing. This is as it should be for it would be contrary both to good conservation practice and good economics for price regulation to interfere with the normal operation of market forces where these forces tend to provide the greatest possible benefits to the economy as a whole.

Hunt urges that residue gas must be priced higher than gas-well gas so that a processor selling residue gas can cover his processing costs plus a return on his investment in addition to the price of the gas-well gas he purchases. This reasoning ignores the fact that saleable liquid hydrocarbons are derived from the gas that is processed. The principal purpose of such processing is the removal of these liquids so that revenue may be realized from them. There is every reason to believe that the value of the liquids will be sufficient to justify gasoline plant processing of new gas-well gas. If not, there is no apparent economic reason to encourage the processing at gasoline plants.

We therefore reject the argument that the price of residue gas derived from gas-well gas should exceed that of gas-well gas. For the future, if processors of gas-well gas cannot buy gas-well gas at a price which enables them to make a profit on their operations at the ceiling prices we prescribe, we assume that

such gas will not be processed by the producers. As to presently existing contracts by processors for the purchase of gas-well gas, if proper price relationships cannot be negotiated relief may be afforded in a proper case under the special relief provisions set forth later in this opinion. There should be very few of such cases, in view of the extremely small percentage of residue gas derived from gas-well gas.

THE RATE FOR FLOWING GAS [21]

Basic Approach

In the previous section we explained why a separate ceiling is not appropriate for casinghead gas or for residue gas derived therefrom and why the cost of old gas-well gas may appropriately constitute the basic yardstick for establishing a single ceiling price applicable to all gas other than new gas-well gas. We proceed with a determination of the cost of old gas-well gas.

The examiner determined the cost of old gas-well gas by employing virtually the same method he used to establish the price of new gas-well gas, with certain cost components adjusted by trending to approximate cost levels in the prior years when the old gas-well gas entered the interstate market. The State of California and the Public Utilities Commission of California have urged that the historical composite cost-of-service for the Permian Basin area based on questionnaire data be used to determine the price of old gas-well gas. Staff's basic case consisted of a composite historical cost-of-service presentation which California Distributors and Staff in its reply brief suggest should be used as a check on the examiner's method of computation of the cost of old gas-well gas.

As we have previously found, the examiner's method which is designed to approximate needed expenditures for finding and producing future gas-well gas supplies is the proper one for fixing the price of new gas-well gas. However, flowing gas is in a different category. Changes in the price cannot increase substantially the total amounts of gas which are already dedicated to interstate commerce [22] nor can they materially affect the supply of oil-well gas which is discovered as a by-product of the search for oil, although they could to some extent affect the amount dedicated to interstate commerce in the future. The revenues received from flowing gas, should, therefore, be based on composite historical costs, including a fair allowance for expenditures for E&D. The price for flowing gas must also reflect the producers' need for revenues from their present sales to support future discoveries.

We believe that the most solid basis in the record for determining the just and reasonable price of old gas-well gas is the composite cost-of-service presentation for the Permian Basin made by the Commission's Staff. The presentation uses 1960 as a test year to determine the cost of old gas-well gas. An approach based on historical costs for flowing gas enables us to draw on the cost finding techniques applied in previous producer cases on an individual company basis. We shall, therefore, use the composite historical cost-of-service for old gas-well gas, for the 1960 test year, as the basis for the flowing gas price. While we place primary reliance on Staff's cost-of-service presentation, we shall later show that the examiner's method of trending back the new gas-well gas cost yields approximately the same cost and thus serves as a useful verification of our result.

It should be noted that we are utilizing a different cost-finding approach for flowing gas than that used in calculating the cost of new gas-well gas. The cost

[21] The term "flowing gas" in this section will be used to include all gas other than new gas-well gas or residue gas derived therefrom. It includes old gas-well gas, all casinghead gas, and residue gas derived from old gas-well gas or casinghead gas.

[22] To a small extent the price might affect the stage at which wells are abandoned because the proceeds of operation do not defray out-of-pocket costs.

of new gas-well gas was geared to the cost of finding and producing future gas supplies and as such was built up primarily from nationally published statistics and the questionnaire data which to a large extent identified costs that could be related to gas-well gas. We were thereby enabled to minimize the need for allocations. However, with regard to flowing gas our touchstone is the historical cost of the gas being produced in the Permian Basin in 1960. The primary data includes joint product lease costs and joint E&D expenditures, whereas for new gas-well gas the parties developed cost-finding techniques that minimized the allocation problems. In deriving the cost of the flowing gas-well gas, therefore, it is necessary to utilize allocations to a greater degree than for new gas-well gas (although to a much less extent than with casinghead gas) and for this reason the details of the cost computations of new gas and flowing gas will not be comparable.

The basic evidence utilized in Staff's composite cost presentation was collected for 1960. In addition, certain trend information was obtained for prior years. These and related data reveal that the 1960 level of costs is fairly representative of the costs during the three year period ending in 1960. While unit costs were somewhat lower in the earlier years, they leveled off in 1958 and so far as the evidence shows have never since exceeded this level. The 1960 test year is, therefore, typical of current and future costs of the flowing gas and it is also more than fair to the producers as a basis for just and reasonable prices for the prior years when costs were slightly lower. The alternative of a separate cost study for each of the years prior to 1960 would have presented an almost impossible task. At best it would have prolonged this proceeding greatly. Such an effort was not justified since little gas was selling in the 1954–1957 period at prices even approaching our ceiling as established herein.

Preliminary Questions

An initial question in using the composite cost-of-service approach for determining the rate for flowing gas is whether production costs should be determined on the basis of nationwide costs incurred by the producers operating in the Permian Basin or whether their Permian costs alone should be used. While the staff presented its evidence derived from the questionnaires to show costs both ways, it argued that the emphasis should be on the Permian Basin cost experience. The producers, on the other hand, argue that the nationwide basis should be used.

Other than for E&D, the data is available in the record to determine the costs incurred in the Permian Basin. The ceiling price we fix herein is an area rate for flowing gas in the Permian Basin, not a national price, and in our opinion should be based primarily on area costs.

The Major Producer Group argues that if area costs are used the demand for gas would tend to concentrate in the lower cost and lower priced areas at the same time that the lower prices would tend to discourage exploration and restrict supply in the area. This argument, if valid at all, would apply only to new gas-well gas where the price we fix could materially affect future discoveries, and there we rely on national data. We are here determining costs and rates for flowing gas in the Permian Basin and for such gas we shall, therefore, use Permian costs to the extent feasible.

While the principle is important the issue is not a major one in this area because the difference between national and area production costs is approximately 0.25 cents per Mcf in Staff's presentation.

A further preliminary question arises as to the use of the questionnaire data from Appendix C, the simplified form designed for producers with less than

10,000,000 Mcf of annual jurisdictional sales in 1960. The Commission's Appendix B is a comprehensive questionnaire designed for the major producers, those with 1960 jurisdictional sales in excess of 10,000,000 Mcf. Replies to the major questionnaire (Appendix B) were received in complete form from 67 respondents in the area. These respondents included 42 major producers [23] and 25 producers of less than 10,000,000 Mcf who voluntarily completed the form.[24] Appendix C questionnaires were mailed to all of the over 350 small producers in the area but responses were filed by only 105 of them. Of these only 60 were sufficiently complete to be compiled. The Commission's staff computed the results of the responses to Appendix C separately but included the Appendix C data in its composite cost of service.

The examiner concluded that the data provided by the major producers with respect to their Permian production was fully representative of area costs, but that the response from the small producers in the Appendix C group could not be used because the percentage coverage of the small producers was not large nor was the sample random.

We agree with the reasoning of the examiner. The issue is of a *de minimis* nature in any event because the percentage of gas produced in the Permian Basin by such producers is so small that the results could not be affected appreciably. The unit cost of gas in this proceeding would be increased by less than 0.07 cents per Mcf even if Appendix C returns were included. In these circumstances we shall rely exclusively on the Appendix B cost data.

The Composition of Costs

The total costs upon which the price for flowing gas is to be based may be divided into two principal categories: (1) production costs, which include operating expenses and DD&A (depreciation, depletion and amortization), as well as a return on the production investment and (2) exploration and developments costs (E&D), which includes an allowance for the expenses incurred in the search for gas. We are not concerned with the gasoline plant costs which the staff considered and treated at some length because, as already explained, in this area we are determining a price based on the cost of gas-well gas which will also apply to residue gas from other than new gas-well gas.

Production Costs

The compilation of the production costs by the staff is essentially the task of compositing by type of lease the items reported by the producers in response to the Commission's questionnaire and allocating the costs between gas and other products. The allocation problems which we shall discuss herein are the principal difficulties, but there are a number of other issues which must be resolved. They include the treatment of combination leases, corporate common costs, reinjected volumes, the development of oil and gas legs for allocation of production costs, and lease play allowance. These somewhat technical issues are discussed in Appendix C to this opinion. Otherwise the computation of the composite unit costs of production operating expenses, the composite rate base and the allowance for DD&A, simply involve the arithmetic of compiling the appropriate data. The results are shown in the summary at *infra*, page 216.

Allocation of Production Costs by the Relative Cost Method

There is of course no allocation problem in computing the production costs of dry gas-well gas. However allocations are necessary for the gas from gas

[23] This total includes all the major producers in the area, except one who did not fill out the questionnaire in a usable manner, although given ample opportunity to do so.

[24] The returns from these 25 producers do not affect the cost computations to an extent that would change the results.

condensate reservoirs. In computing the production operating costs for flowing gas-well gas we shall utilize the relative cost method to divide the joint production costs between the liquids and the gas on the gas condensate leases with lease separation.[35] The basic rationale of the relative cost method is that joint production costs should be allocated in relation to the separate production costs of oil and gas. This method is analogous to the allocation procedure used by United States agencies and approved by this Commission to allocate the cost of a multi-purpose hydroelectric dam between power, flood control and other beneficial uses.[36] The cost of the portions of a dam used for more than one purpose is allocated in accordance with the relative cost of a separate dam or other required facility for each purpose. Here the relative cost of each co-product, gas and oil, is used as the basis of allocating the cost of producing the two products jointly.

The first step in the relative cost method is to determine the unit cost of oil from leases producing oil only (the "oil leg") and the unit cost of gas from leases producing gas only (the "gas leg"). The unit cost for each of the two separate products is then multiplied by the volumes of liquid and gas produced on the joint production leases. This provides a total relative cost for the liquids and gas produced on such leases and a ratio of gas cost to total cost. This ratio is then applied to the total cost of the gas condensate leases in order to obtain the unit costs as they apply to the jointly produced gas.

While producer-respondents and the presiding examiner have questioned the use of the relative cost allocation method, it is relatively simple and workable, has been accepted in principle in our electric power work for decades, and has been repeatedly used and approved by the Commission in producer rate cases. *Phillips Petroleum Co.*, 24 FPC 537 (1960), affirmed *sub nom. Wisconsin* v. *F.P.C.*, 303 F. 2d 830 (1961), affirmed 373 U.S. 294 (1963), especially at pages 553, *et seq.; Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). The reasoning which supports the relative cost method of allocation in computing individual company costs is equally applicable to composite area costs. The detailed application of the method and the arguments against it are dealt with in Appendix C.

Rate of Return

Among the most important issues is the rate of return for flowing gas. We have already discussed in detail the many factors which led us to conclude that a 12 percent return is appropriate. Two of these factors warrant a somewhat different treatment in considering the appropriate return for flowing gas. First, the great bulk of the flowing gas was not found as the result of exploration or development directed toward gas but rather as an incident to the search for oil. In evaluating the risk factor for flowing gas we must therefore consider that there was by no means the same degree of risk knowingly undertaken in finding such gas as in the case of new gas-well gas. On the other hand, much of the flowing gas in the Permian Basin is below pipeline quality and thus will not command the ceiling price prescribed herein and this problem of low quality is more pronounced in flowing gas than in new gas-well gas.

In our judgment these two factors of lesser and greater risk considered together with the other considerations in our previous discussion of rate of return, which apply equally to flowing gas, persuade us that a 12 percent return is appropriate. Also relevant to our conclusion is the fact that revenues from flowing gas are a factor in the scale of exploration for new gas. Moreover,

[35] "Lease separation" refers to the separation of condensate liquids from the gas on the leased property, rather than by later processing.

[36] See, for example, order issued March 5, 1965, 33 FPC 411, in Docket No. E-6383, *Allocation of Costs, McNary Project, Columbia River Washington-Oregon*, and attached Bureau of Power report.

flowing gas includes new accretions of casinghead gas and residue gas resulting therefrom, the price of which may well determine the extent to which such gas is committed to the interstate market. Accordingly, we shall allow a 12 percent return on flowing gas.

Summary of Production Costs

Employing the relative cost method, making the other necessary determinations as discussed in Appendix C, and using the 12 percent rate of return, we arrive at 9.16 cents per Mcf for production costs, consisting of the following:

Production operating expenses	1.75
Depreciation, depletion and amortization	2.42
Return	4.99
	9.16

Exploration and Development Costs

Exploration and development costs pose a different problem than production costs. E&D covers dry hole expenses, geological and geophysical expenses, lease rentals, cancelled and surrendered lease expenses, and all other costs expended on nonproductive properties in the effort to find gas. Expenditures for E&D are not earmarked for particular producing areas but on the contrary are incurred on a nationwide basis by the major producers, who make these expenditures largely in accordance with prospects for discovery rather than on an area-directed basis. No one disputes the fact that the E&D allowance for flowing gas should be computed on a nationwide basis.

The principal problem is the proper allocation of total E&D expenditures between gas and liquids. The allocation problem is illustrated in our *Phillips* opinion, 24 FPC 537, 555–562 (1960). After closely analyzing many possible allocation approaches the Commission adopted the use of the modified Btu method in the Phillips case and reaffirmed it in *Continental Oil Company*, 27 FPC 96, 104 (1962); *Hunt Oil Company*, 28 FPC 623, 624 (1962); and *H. L. Hunt*, 28 FPC 897, 901 (1962).

The modified Btu method of allocation in the *Phillips* case was designed to utilize as a basic standard the relation of the fuel value of gas to the fuel value of oil, but at the same time adjust this relationship to reflect economic trends and the needs of the public for continued exploration and development. Thus the Commission considered not only the ratio of Btu's in a barrel of oil and in an Mcf of gas (about 6 to 1 for *Phillips* production), but also the increasing demand for gas compared to oil, the deeper drilling needed in exploring for gas, the upward trend of gas production, the ratio of the market price of gas to the price of oil, and other matters. Emphasizing that its determination was based on judgment, the Commission determined that an economic factor of 4 should be applied to the Btu content of oil to allocate *Phillips'* exploration costs. The resulting cost relationship of finding an Mcf of gas to one barrel of oil was then about 1 to 24, rather than 1 to 6 as on a straight Btu basis. The Commission pointed out that the result might well be different in a case, unlike *Phillips*, where rates were being determined for the future.

In the present area proceeding Staff, through Witness Lyon, advocated the general method used in *Phillips*, with certain refinements, the principal one being the use of separate economic factors for gas-well gas and casinghead gas, in place of the single factor provided in *Phillips*. The total national costs were apportioned by the Staff to the lease products on the basis of these factors, the amounts so allocated were divided by the respective national volumes of the lease products to determine national unit allowances, and these unit values were then imputed to the Permian sales.

The respondents proceeded differently. They propose to allocate the expenses of developmental dry holes on the basis of the well drilling intentions of certain producers who were polled, the expenses of exploratory dry holes on the basis of intangible drilling costs associated with successful wells, and remaining exploratory expenses on the basis of successful expenditures for gas reservoir reserves compared to oil reservoirs. For the separation of gas and condensate, respondents would convert the condensate back to vapor and allocate costs on the basis of the relative vapor volumes of the gas and the condensate.

The examiner correctly found the respondents' method unsound because it ignores the economic purpose of the driller. While a barrel of condensate is worth some 20 times the value of an Mcf of gas, under the producer's vapor volumetric method an Mcf of gas would be assigned about the same E&D expenses as a barrel of liquids which vaporizes to about the same volume as an Mcf of gas. We may also note that in the allocation of developmental dry hole costs there was a considerable degree of self-selection in the responses from the polled producers. Expressions of "intention" also involve subjective considerations. The data obtained are not the result of a random sample of all producers on an objective basis and do not offer a reliable foundation for fixing prices.

We have reviewed the evidence in the record on this issue and believe that Staff's general approach to the problem is sound but that the breakdown between gas-well gas and casinghead gas is an unnecessary complication of the allocation procedures.[37] The issue is one of exercising reasonable judgment in allocating the total cost between the co-products.

The basic staff method has been attacked by both the producers and the examiner as being circuitous, in that the existing price of flowing gas-well gas is used as one of the bases for determining what the price of flowing gas-well gas should be. We are now able to remove an element of circuitry from such an allocation by reason of the fact that we have computed a cost of new gas-well gas of 16½ cents per Mcf by an independent cost finding technique. We are thus able to relate the price of oil fixed by the marketplace to a separately established price of gas, to aid us in making these allocations.

The record indicates that the 1960 average price in the field for liquids is $2.90 per barrel which would be related to the 16½ cents per Mcf price of gas which we have established herein. The questionnaire data in this record reveals that the ratio of Btu's in a barrel of liquids to Btu's in an Mcf of gas-well gas is 5.1 to 1. Utilizing this Btu ratio and the independently established prices previously mentioned we arrive at a value relationship of a Btu of liquids to a Btu of gas-well gas of 3.45 to 1.[38]

There are other factors which must be considered in arriving at the economic factor for determining the appropriate allocations of E&D expenses between gas and oil. One such guide is the fact, established in the record, that the production costs of a Btu of oil are roughly 4½ times that of a Btu of gas. Another factor to be considered is that the 16½ cents price is one that we have determined to be appropriate for the future for new gas-well gas and that the price of gas moved sharply upward during the 1950's in relation to the price of crude oil. We must also consider that we are determining a cost to be used for fixing prices for flowing gas for the future as well as for the past.

---

[37] The further breakdown between gas-well gas and casinghead gas would result in only a difference of 0.12 cent in the E&D expense allocated to flowing gas-well gas and involves the use of questionable value differentials.

[38] The price ratio of $2.90 per barrel of oil to 16.5 cents per Mcf of gas is 17.6 to 1. This ratio is then divided by the 5.1 to 1.0 Btu ratio to determine the value relationship of 3.45 to 1.

These considerations and the other data from the record relating to the allocation question, lead us to conclude that in allocating total E&D expenses, an economic factor of 3.5 should be applied to the Btu's of crude oil and condensate liquids production as compared with an economic factor of 1.0 for the Btu's of all gas. Allocations on a Btu basis so adjusted in our judgment will give proportionate weight to the costs, prices, quality and other economic relationships of the respective hydrocarbons.

We also believe that these relative weightings should be applied to the national production of hydrocarbons, rather than to the Permian Basin production because E&D is conducted on a national basis.[39]

Applying these factors to the national production, the E&D costs for flowing gas-well gas would be 4.08 cents. The details of the computation are shown in Appendix C, pp. 301–303.

Summary of the Cost of Flowing Gas

The cost of old gas-well gas may therefore be summarized in accordance with the evidence presented by Staff and the discussion above as follows:[40]

Production	9.16
Exploration and Development	4.08
Regulatory expense (see p. 197)	.14
	13.38
State production tax @ 7%	1.01
Total	14.39

COMPARISON WITH EXAMINER'S COMPUTATION OF COST OF OLD GAS-WELL GAS

As we noted at the outset we place primary reliance on the historical test-year cost of service presentation. However, the examiner's method of computing the cost of old gas-well gas, with the revisions we think necessary, serves as a useful check on the results. It yields a cost closely comparable to that derived from the more traditional cost-of-service approach.

The examiner found that the cost of old gas-well gas should be fixed at the average cost of gas-well gas produced in 1960. Gas produced in 1960 resulted from exploration and development conducted in some cases many years before, and the cost of drilling and equipping wells which produced gas in 1960 was incurred in years ranging over a span of two decades. Accordingly, the examiner adjusted his exploration and development costs to reflect the lower cost in earlier years.[41]

[39] There is in this case little difference in the practical result, since the application of these factors to area production rather than to national production would change the results of the cost computation by approximately 0.01 cent.

[40] There is no separate item for royalty payments because costs were computed on the basis of ⅞ of the actual volumes and the royalty payments were thus included as an integral part of the cost-of-service computations.

[41] In view of the impracticability of determining such costs directly, the examiner used the following procedure, outlined in Appendix C to the initial decision: "The purpose of this analysis is to compare the average finding cost of old gas-well gas (the gas produced in 1960) with the cost of finding new gas-well gas (the reserve additions found in 1960). The general procedure follows these main steps: (1) the total volume of gas-well gas produced in 1960 is distributed by estimated year of discovery; (2) the volume associated with each year of discovery is weighted by an index of drilling cost per Mcf for that year (1960=100); and (3) the results are totaled and then divided by 1960 production, thereby deriving a weighted average finding cost for the gas produced in 1960 relative to the finding cost of gas-well gas found in 1960. The basic data for this analysis consists of: (1) production of gas-well gas reserves; (2) estimates of annual additions to gas reserves; and (3) indices of annual drilling costs per Mcf of reserves added."

We think that the procedure used by the examiner to arrive at his old gas-well gas cost is reasonable but that certain items of his computation require revision.

The examiner found that total exploration and development costs for old gas (dry-hole costs, other exploration and development expenses, and allowance for growth) should be 25 percent below the figure of 4.12 cents per Mcf applicable in the case of new gas-well gas. This discount yielded a figure of 3.09 cents per Mcf for exploration and development. Production investment costs, DD&A and return, were similarly discounted 25 percent from the 3.95 cents and the 5.21 cents, respectively, applicable in the case of new gas-well gas, yielding a DD&A of 2.96 cents per Mcf and a production investment return of 3.91 cents per Mcf applicable to old gas-well gas.

Unlike production investment costs, exploration and development costs are not capitalized in our decision in this proceeding. They are expenses to be recouped by a producer in the year in which they are incurred. The fact that a lower original investment was necessary to produce gas flowing in 1960 does not affect the exploration and development expenses incurred in that year. Accordingly, these costs should not be discounted, but should be the same as those included in the computation of the cost of new gas-well gas. We shall therefore allow the same amount for E&D as we permitted in the price of new gas-well gas.

In computing the production investment for old gas-well gas staff contends that it should be 84 percent of the new gas-well gas investment cost rather than 75 percent as a result of two revisions of the examiner's method. Staff accepted the examiner's method of deriving the cost of flowing gas-well gas; however, it proposed an 84 percent rather than a 75 percent discount factor as a result of two revisions of the examiner's method.

Staff's first revision of the examiner's approach was a technical adjustment of the annual index of drilling and equipping costs per Mcf added. The examiner's index measures the trend of the allocated cost of total gas reserves added (gas-well gas and oil-well gas), whereas Staff's index measured a trend of unallocated gas-well costs per Mcf of gas-well gas only reserves added. Since we are deriving a gas-well gas cost it appears that Staff's index is preferable to the examiner's index. Staff has utilized an index which produces a result approximately the same as the examiner's but avoids many of the complicated allocations. Accordingly, we will use Staff's index of drilling and equipping costs.

Staff's second revision of the examiner's backtrend method was to apply its national drilling and equipping cost trend to the vintage mix of jurisdictional gas-well gas produced in the Permian Basin rather than applying the cost trend to the vintage mix of all flowing gas-well gas on a nationwide basis, as was done by the examiner. We have determined that the ceiling price for flowing gas-well gas should be fixed primarily on historical costs in the area (*supra*, pp. 212–214). Therefore, the gas-well gas cost trend should be applied to the vintages of gas-well gas in the area.

These adjustments result in a figure of 3.32 cents for DD&A and 4.38 cents for return on production investment rather than the 2.96 cents and 3.91 cents, respectively, used by the examiner.

With respect to all other items we shall follow the examiner's technique and use the same items of cost as used in the new gas-well gas computation. With respect to the amount for net liquid credit a word of explanation may be in order. The Commission concluded that the net liquid credit should be 3.10 cents per Mcf, rather than 2.68 cents per Mcf as allowed by the examiner. The Commission based its determination primarily on questionnaire data but in our discussion we pointed to the trend in recent years toward increased realization

of condensate per Mcf of gas. The trend for the future has limited application to the liquid credit for flowing gas, but we do not rely on this factor and it is not material to our conclusion. The liquid credit we used for new gas-well gas is primarily based upon the questionnaire data which reflects the historical experience of condensate production. The figure we adopted is lower than the amount that could be justified by the latest statistics showing condensate production from the recent discoveries, especially those at greater depths. We believe that our allowance for liquid credit conservatively reflects the condensate derived from the flowing gas-well gas the costs of which we are attempting to verify.

The examiner's computation of the cost of old gas-well gas and our modification of his computation of course reflect the net differences in numerous other items previously discussed in our determination of a new gas-well gas price. A complete comparative summary follows.

	Cost in cents per Mcf	
	Examiner	Commission
Exploration and development costs:		
Dry holes	1.07	1.42
Other exploratory costs	1.19	1.59
Allowance for growth	.83	1.11
Production operating expense	2.88	2.70
Net liquid credit	(2.68)	(3.10)
Regulatory expense	.14	.14
Depletion, depreciation, and amortization of production investment costs:		
Successful well costs	2.16	2.42
Lease acquisition costs	.57	.64
Cost of other production facilities	.23	.26
Return on production investment (at 12%)	3.91	4.38
Return on working capital	.20	.35
Subtotal	10.50	11.91
Royalty at 12½%	1.60	1.83
Production taxes [42]	.72	.90
Total	12.82	14.64

[42] Texas production taxes of 7 percent have been used in this computation. New Mexico taxes are lower, and both cost computations and the ceiling price should be reduced accordingly for gas produced in New Mexico. The amount of production taxes does not include taxes on the royalty payments which are chargeable to the royalty owner. The results, however, are identical to the alternative method summarized, *supra*, at p. 218in which royalty payments were computed as an integral part of the cost of service and the separate item for production taxes was somewhat higher because it included taxes chargeable to the royalty owner.

It is apparent that the results obtained by using the examiner's method, as adjusted in the light of the Commission's views on liquid credit, return and other items, conform very closely with the results obtained in the Commission's own historical cost computation.

THE PRICE OF FLOWING GAS

On the basis of an historical cost determination, as verified by the examiner's approach, we shall fix a ceiling price for flowing gas rounded off at 14.5 cents per Mcf at 14.65 psia for gas produced and sold in Texas. The ceiling price in Texas includes a 1.01 cent productive tax, which we round off to 1.0 cent, leaving a rate less production taxes of 13.5 cents. For gas produced and sold in the three New Mexico counties, Chavez, Lea and Eddy, the ceiling price shall therefore be 13.5 cents per Mcf at 14.65 psia plus the applicable production taxes in effect as of the date of this opinion. In accordance with the earlier discussion, this ceiling price will apply to all casinghead gas, and residue derived therefrom, both old and new, as well as to old gas-well gas and residue gas derived therefrom.

PRICE ADJUSTMENTS TO REFLECT QUALITY DIFFERENTIALS

The importance of quality standards as an integral part of our ceiling price becomes readily apparent if it is recognized that gas is purchased for its energy. The price of gas cannot be related to volume alone but must be related to units of energy free of impurities and sufficiently compressed to enter the pipeline if it is to serve as a mechanism to assure just and reasonable rates. The presiding examiner pointed up the importance of relating the quality of gas to its price as follows:

> * * * Lowering the quality of the gas is the same as raising its price. If the pipeline purchases gas of lesser quality than previously, bears the cost of additional processing to raise the gas to its former standard, and includes the added costs in its cost of service, the result is the same as if the prices charged for the gas by the producer were raised. A pricing system that fails to insure quality and value is a sieve. [*infra*, p. 366]

Some of the respondents have urged that no specific price differentials be established to reflect variations in quality. They argue that buyer and seller, after a ceiling price is fixed, will establish lower prices for gas of below standard quality by bargaining.

If we accepted the producers' contention, the burden of securing lower prices to reflect lower quality gas would be on the pipeline, and the record does not support the producers' contention that through bargaining the parties would necessarily agree upon prices for gas with quality deficiencies which were below the ceilings imposed for pipeline quality gas. A large loophole for evasion of ceiling prices would lie open; a producer receiving the ceiling price for inferior quality gas would be piercing the ceiling prices, insofar as the consuming public is concerned, just as much as if the producer were collecting an above-ceiling price for pipeline quality gas or deliberately diluting the gas with inert material. In addition, gas now flowing under existing contracts would not be repriced, whatever bargains might be made for the future. Its price would be governed by the existing contract terms, limited only by the applicable area price ceilings. We think, therefore, that in this proceeding we must require the area ceiling prices for new gas-well gas as well as flowing gas to be adjusted for departures from the standards for gas of pipeline quality. We believe that the record in this case provides an ample basis for the quality guidelines we here establish.

A preliminary question is the basis upon which the quality adjustments should be applied. We think these price differences should be predicated upon differences in the quality of gas sold under particular contracts rather than upon an averaging process. Such an approach is fairer to the individual producers, and avoids the possibilities of manipulation which would be inherent in a price system which failed to reflect quality differences in particular transactions.

Quality Standards

The first step in establishing price variations corresponding to variations in the quality of gas is to determine the quality standards which must be met if gas is to command the ceiling price applicable to its particular category. There are several quality factors which require consideration in establishing prices in the Permian Basin and we shall discuss each of them separately.

Sulphur

Sulphur, hydrogen sulphide, and other sulphur compounds are the most prevalent impurities in gas in the Permian Basin. The problem is greater here than in any other area in the country. The generally accepted standard

in the Permian Basin, which we here adopt, is that gas which contains more than 10 grains of hydrogen sulphide or 200 grains of total sulphur per Mcf is designated as "sour gas" and is not considered to be of pipeline quality.[43] Gas containing 10 or less grains of hydrogen sulphide and 200 or less grains of total sulphur is known as "sweet gas" and is considered to be of acceptable pipeline quality in this respect. These standards are not only generally accepted in the Permian Basin, but it does not appear that any different standard with respect to sweet and sour gas is applied in other areas.[44]

Water

The record establishes that an accepted standard for pipeline quality gas in the Permian Basin is that the gas shall not contain in the aggregate more than 0.009 pound per Mcf of water, either in the form of liquid or vapor.[45] The prevailing national standard appears to be that gas should contain no more than 0.007 pound of water per Mcf of gas. Even more stringent standards appear in some of the contracts for sale of gas in the Permian Basin.

It may be argued that, since the national average cost has been used in arriving at the ceiling price for new gas-well gas fixed in this proceeding, the national standard for such gas should apply rather than an area standard. Until such time as this Commission has by rule established a different standard, we prefer to adhere to the accepted practices of the industry in the area and we shall consider gas in the Permian Basin containing not more than 0.009 pound of water per Mcf to be of pipeline quality.

Carbon Dioxide

Carbon dioxide is found in excessive quantities, sometimes as much as half of total volume, in 2 to 3 percent of the gas produced in the Permian Basin. It is not combustible and so has no value as fuel. Under the present technology, it contributes nothing in the way of liquids and is valueless to the petrochemical industry. It is not merely a diluent which reduces the value of the gas in proportion to the extent that it is present; it combines with H_2O to form a comparatively mild acid which has a corrosive effect on pipelines. When present in large quantities, its removal is required before the remaining gas can be considered to be of standard pipeline quality, and extraction may be costly.

The evidence in the record indicates that where carbon dioxide is a problem in the Permian Basin, it comprises over 5 percent of the volume of the gas. However any amount of carbon dioxide reduces the value of the gas and we believe that the presence of more than 3 percent of useless diluent in the gas sold to a pipeline would require a reduction in the price. Accordingly, for the purpose of this proceeding, a standard for pipeline quality gas shall be that carbon dioxide shall not exceed 3 percent by volume.

Other Impurities

There was no testimony in the record with respect to impurities other than carbon dioxide, water, sulphur, hydrogen sulphide, and other sulphur compounds. Some filed contracts contain clauses requiring the gas sold under them to be free of oxygen, dust, dirt, gums, and other substances. Precise standards cannot be established with respect to these impurities. The only standard which

[43] Total sulphur shall be determined as provided in: "Test for Total Sulphur In Fuel Gases" ASTM Designation: D 1072–56, adopted 1956.

[44] We are cognizant of the slightly more liberal definition of sweet gas used by the State of Texas.

[45] Water vapor content is to be determined as provided in: "Test for Water Vapor Content of Gaseous Fuels By Measurement of Dew-Point Temperature" ASTM Designation: D 1142–58, adopted 1953, revised 1958.

may fairly be applied, on the basis of this record, is that such impurities will be considered excessive to the point requiring a reduction in the price of the gas if they are present in sufficient amounts so that a pipeline incurs processing costs to remove them from the gas.

Btu Content

The record in this case reveals that in the past the level of Btu content (other than loss of Btu's resulting from excessive carbon dioxide content) has not been a substantial problem in the Permian Basin. Contracts for sales of gas in the Permian Basin generally contain clauses specifying that the Btu content of the gas sold shall not be less than a minimum, generally 1,000 Btu's, and little gas below that level (other than gas containing substantial amounts of carbon dioxide) has been sold in the Permian Basin. Any attempts to evade the ceiling prices for flowing gas imposed herein by reducing the Btu content of the gas below current standards in the area will come to our attention and may be dealt with as the occasion demands. Under these circumstances we see no need to establish any standard Btu content for flowing gas in the Permian Basin so long as present conditions continue.

Looking to the future, however, we believe that it is important that we implement the general principle that Btu adjustment provisions "are in the public interest", advanced in our recent decision in *Texaco Inc.*, Opinion No. 464, 33 FPC 1228 (decided June 10, 1965). While Btu adjustments have not played a major role in the Permian Basin in the past we believe it important that our price for new gas-well gas reflect the energy content of the gas, which in reality is what the consumer is purchasing. We therefore believe it is necessary and appropriate to provide an upward adjustment for this premium quality feature of benefit to the consumers as well as to provide downward adjustments for deficiencies in quality for new gas-well gas. Such adjustments are to be used in computing the applicable pice for new gas-well gas irrespective of whether the underlying contracts contain a Btu adjustment clause. However a producer will of course be limited by his contract if it is below the applicable ceiling as adjusted.

We believe the weighted average Btu content of gas-well gas in the area should generally be used as the guideline for upward adjustments. The weighted average Btu content for gas-well gas in the Permian Basin as shown in Exhibit 118 is 1,042 Btu's per cubic foot. That exhibit reflects the facts for over half of the gas-well gas in the area, and while the precise figure may be somewhat higher or lower, the exhibit indicates that the weighted average is certainly well above 1,000 Btu's per cubic foot and does not exceed 1,050 Btu's. Accordingly, in computing the quality adjustments to the ceiling prices for new gas-well gas we shall permit an upward Btu price adjustment from a base of 1,050 Btu's per cubic foot on a proportional basis above the ceiling price fixed herein. The record also reveals that a minimum standard for pipeline quality gas in the Permian Basin is 1,000 Btu's per cubic foot. The 1,000 Btu minimum is not a national standard but is based on the evidence of the practice in the Permian Basin. We shall accordingly provide a downward adjustment for new gas-well gas from a base of 1,000 Btu's on a proportional basis from the ceiling price fixed herein.[46] The range of 1,000 to 1,050 Btu in which no adjustment will be required in the Permian Basin is not necessarily controlling for other areas where the record may well suggest a narrower range.

---

[46] For example, new gas-well gas containing 1,155 Btu's will be allowed a 10 percent increase in rate, and new gas-well gas containing 950 Btu's will be subjected to a 5 percent reduction in rate.

The Btu content of the gas to be used in determining price adjustments can be defined as the total heat value of the standard cubic foot as specified in Opinion No. 464. So that no producer will be penalized twice by the application of a reduction in rate for Btu deficiency in addition to a reduction required by the presence of carbon dioxide or other impurities, the Btu content should be measured after any necessary processing of the gas to remove impurities, as well as after removal of any liquids for which the buyer pays separately, whether on a percentage basis or otherwise.

Pressure

The question of pressure is more complex. Gas cannot enter a pipeline unless it is under greater pressure than the pipeline pressure at the point of entry. Gas of lower pressure must be compressed to raise its pressure above that of the pipeline which it is entering. It is not the number of pounds by which a given quantity of gas may fall over pipeline pressure that is important, but the number of stages of compression through which the gas must be put in order to raise its pressure suffiiciently. The majority of the main-line pipelines in the continental United States operate to maintain a pressure at the compression stations ranging from 800 pounds to 1,000 pounds per square inch (psi) or about 900 psi on the average. Evidence in this case of actual delivery pressures for producers in the Permian Basin indicates that pipeline purchasers in the Permian area have main-line operating pressures averaging about 800 psi. Thus we are presented with the question of whether a national pressure standard of some 900 psi should be adopted here or whether we should use the average pressure in the Permian Basin of about 800 psi.

It could be argued that where national average cost is used in establishing a ceiling price, the average national pressure should also be used in establishing the standards to which gas priced at the ceiling must conform. However, the prices we fix here are area prices, and may be modified in other areas for factors other than cost. The adoption of a 900 pound pressure standard for the Permian Basin would require a price reduction on all Permian Basin residue gas and nearly all gas-well gas. While delivery of gas at higher pressure would confer some benefits on the pipeline (by reducing the amount of compression needed to move gas along the pipeline) it seems inequitable to penalize the producers and processors who deliver gas at the pressure for which the pipeline is designed and who in many cases could have delivered it at higher pressure if called upon to do so, without additional expense. The physical equipment in the Permian Basin is now largely geared to delivery at 800 pounds pressure. We shall therefore adopt an 800 pound pressure standard for the Permian Basin.

The Amount of Price Adjustment

In accordance with the foregoing, we set forth the following principles to govern price adjustments when a purchaser buys gas which deviates from the standards here established for gas for pipeline quality:

(1) The applicable ceiling price shall be adjusted downward by the net cost of processing the gas to bring it up to standard, by the amount of any applicable upward or downward Btu adjustment (for new gas-well gas only) and by the amount of any saving or additional expense to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(2) If the processing is performed by the purchaser, a reasonable return upon the required investment should be included as a part of the processing cost incurred in bringing the gas up to pipeline quality.

(3) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

Procedure

In establishing a procedure for determining the amount of the reduction in the ceiling price applicable in the case of gas with quality deficiencies, our purpose is to impose the minimum regulatory controls required to carry out effectively our responsibilities to assure wholesale customers that the price they pay will be just and reasonable. Accordingly, sales by small producers that are covered by the proposed small producer certificate rule, shall be exempt from such adjustments on the *de minimis* principle, because the burden and expense involved would in most cases exceed the amount of the adjustments. Furthermore, the major producers, processors, and pipelines will be allowed in the first instance to establish among themselves, in accordance with the standards set forth here, the amounts by which ceiling prices should be adjusted in the case of each individual contract which deals with gas which deviates from the quality standards herein established. If the parties reach agreement that no change from the ceiling price is required or that a specific price adjustment is required, a statement of the agreed price for the gas shall be filed no later than 90 days from the effective date of this order. The producer as part of the statement shall itemize the amounts and nature of each of the quality adjustments and explain the basis therefor, and set forth the price agreed upon by the parties as representing the applicable ceiling price as adjusted.

If the parties are unable to agree upon any or all of the quality variations of the gas or the costs of remedying defects (except for sales by small producers exempt from these quality adjustments), the required statement must so indicate and the seller must supply the itemized information required to compute the applicable ceiling price as adjusted. The buyer will be given an opportunity to state its position and the Commission will then determine the applicable area rate. Pending such determination, the seller may collect a price not in excess of the unadjusted area ceiling price for the type of gas in question, subject to the obligation to make refund of any excess collected, from the effective date of this order, above the applicable area rate (the ceiling rate reduced by the cost of processing to correct quality deficiencies and, in the case of new gas-well gas, further adjusted for Btu variations) ultimately determined to be proper.

No pipeline will be entitled, as part of its cost of service, to any amounts paid for gas in excess of the applicable ceiling price as adjusted in accordance with the standards and principles set forth in this opinion. The acceptance for filing of any amendment or certificate, or the failure to suspend any rate so established, shall not prevent the application of this rule.

It is our expectation that this procedure will result in the parties determining the proper adjustments in price levels to reflect differences in the quality of gas sold. Should this objective not be realized and should the Commission be confronted with a large number of contests, or should it be found that evasion or abuse is prevalent, it may be necessary to take measures to fix the precise price variations corresponding to variations in gas quality.

PETITIONS FOR SPECIAL EXEMPTION FROM THE AREA RATES

We have already discussed *supra* at pp. 176–180 why we believe that maximum area rates can and should be established as the just and reasonable rates applicable generally to the sales of natural gas in the Permian Basin. The question remains what procedure or procedures should be adopted for the benefit of those respondents who, by reason of special circumstances, believe they can demonstrate that they are entitled to variant treatment.

First, we should frame the limits of the problem. We are not here treating sales to be permanently certificated after the effective date of this decision. In the future it would normally not be in the public interest to certificate sales of gas (including gas flowing under temporary certificates) at initial prices above the applicable area rate. While we do not visualize any reason for certifying any new sales at prices above the just and reasonable ceiling price, any producer unwilling to accept a certificate at the appropriate ceiling will have an opportunity to show in the hearing on his certificate application the special circumstances which he believes warrant making an exception in his case in the public interest.

The problem for our immediate attention thus relates solely to gas presently being sold under outstanding certificates. Our decision herein has a double impact on the gas presently flowing in interstate commerce from producers in the Permian Basin. It fixes a price for the future, and it determines the basis for refunds for past periods. We shall first discuss the basis for permitting special exceptions to the area rate with respect to future rates for flowing gas and later discuss the question of relief from refund requirements.

It would seem clear that where a producer who has contracted for an above-ceiling price can show that his out-of-pocket expenses in connection with the operation of a particular well are greater than the revenues under the applicable area price, he should be entitled to appropriate relief, and there may be other circumstances where a producer as a matter of law or in the public interest would be entitled to some relief.

We need not and cannot here specify all of the special circumstances which may serve as a basis for exceptions to the area rate. It is clear however that confiscation does not result merely because, as a result of high costs or low production, a given producer cannot, at the area price, recover his expenses for his unsuccessful exploration and development costs and earn the 12 percent overall return on producer investment rate base which we have adopted as the appropriate return to attract capital on an area-wide basis for gas exploration and development. We recognize that any amounts received by the producer for flowing gas above out-of-pocket expenses would be available to finance further exploration, but no producer has a constitutional right to a price for the future which will enable him to expand his venture in the interstate gas business and the inability to earn such allowances at the area ceiling cannot be characterized as confiscation. As the Court of Appeals for the District of Columbia recently observed, "the Commission is not required to subsidize high cost producers with consumers' money." *Atlantic Refining Co.* v. *F.P.C.*, 316 F. 2d 677, 680 (CADC–1963); see also *Callery Properties, Inc., et al.* v. *F.P.C.*, 335 F. 2d 1004 (CA5–1964). The same rule certainly applies to the development of reserves which are held off the market for speculative purposes.

Even in situations where producers are able to show that they are entitled to relief from the obligation to continue to sell flowing gas at the appropriate area ceiling, in most cases it may be sufficient to permit them to abandon their unprofitable sales. Unlike the case of some public utilities which cannot abandon service without harming the public dependent thereon, we will seldom have a situation in which a particular producer's abandonment of some or all of its sales in the area will significantly affect the purchasing pipeline, to say nothing of the ultimate gas consumer. There may, however, be some exceptional situations where abandonment could be shown to be detrimental to consumers, or where the producer could demonstrate that some other form of relief would best serve the interests of the public as well as his own.

The remaining confiscation question is with respect to refunds for past periods. On a composite basis the area ceiling prices for both flowing and new gas provide a reasonable allowance for exploration and development and production operating expenses in addition to a 12 percent return on the producing investment. As we stated earlier, a claim that it would be confiscatory to require the refund of amounts a producer has collected above the area rate cannot be supported by the fact that a particular producer in the past has chosen to spend more than a reasonable allowance in what proves to be unsuccessful or marginal exploratory efforts or by the fact that unit production costs are high because for speculative purposes or other reasons the producer has withheld from production gas that he has discovered. On the other hand it seems clear that a producer should not be required to make refunds for past periods which would deprive him of amounts sufficient to cover his out-of-pocket operating expenses in the Permian Basin for such period. We need not consider other situations at this stage of the proceeding; it is sufficient to note that here too we will entertain petitions for special relief, and that the dockets involved will remain subject to the existing interest obligations pending their resolution.

We need not speculate further here as to the exact circumstances in which special relief may be warranted from the area price maximums for some or all of a producer's sales, or the appropriate nature of such relief. Any producer claiming that he is entitled to special relief from the maximum rate set for any of his Permian sales or from the refund obligations imposed herein may file a petition for such relief with the Commission consistent with the general guidelines set forth herein. Any such petition will be disposed of as promptly as possible. Since the petitioner will bear the burden of showing that he is entitled to special relief the producer (unless authorization is granted for temporary abandonment) will not be relieved of his obligation to continue service at the appropriate just and reasonable rate pending the determination of his petition. See *The New England Divisions* case, 261 U.S. 184, 198–199 (1923).

CHANGES IN THE AREA RATE

Our adoption here of a two-price vintaging system of fixing just and reasonable producer prices simplifies questions as to the appropriate or permissible methods for changing such prices. The two-price system enables us to provide a higher price for future discoveries if justified by changed circumstances. It is unlike the situation resulting from the utilization of a single price based upon historical costs, where significant changes in conditions may necessitate a change in the just and reasonable price for all gas. For example, an indication that new well drilling costs were increasing might (all other things being equal) demonstrate that a higher price should be set for gas certificated at some date in the future but would not necessarily show that the just and reasonable price we here prescribe for gas already flowing requires revision. Other changes unrelated to the continuing operations under which flowing gas is brought to market will be relevant only to the question of whether a new price should be set to govern future sales, thus permitting price stability for gas already dedicated to the interstate market.

This does not mean that the just and reasonable price for flowing gas can never vary. We have fixed the price of the pre-1961 gas-well gas and all other gas on the basis of the composite cost showing of gas-well gas for the Permian Basin in 1960. Of course if it could be shown that the average rates of take of such gas had significantly dropped or that the continuing operating costs of the gas wells had increased significantly, it might well be that the maximum just

and reasonable price for such gas should be adjusted. This would also be true for the gas coming into the market since 1960, although the evidence of record indicates that costs have remained remarkably steady during the ensuing years and are likely to remain stable during the moratorium period prescribed herein. Essentially, under the type of pricing we are instituting, the cost of flowing gas-well gas and all casinghead gas and residue gas derived therefrom will tend to remain relatively constant and permit stable rates, even though changing circumstances might demonstrate the need for new and substantially different rates for gas-well gas coming on to the market at later periods.

In this framework, we approach the question of the appropriate mechanism for altering the area rates. We can, of course, in this proceeding fix the just and reasonable price only for gas flowing pursuant to outstanding certificates. We believe that a moratorium for new rate increase filings above the applicable area ceiling prices for a 2½ year period is essential if our decision herein is to achieve effective control over producer prices. In the absence of such a moratorium the producers would be free to file rate increases and continue to collect their producer prices even though they exceeded the just and reasonable rates herein prescribed. Without a moratorium, the conclusion of one area proceeding would only signal the beginning of the next, and just and reasonable rates for consumers would always be one area proceeding away.

The Supreme Court recently noted the obvious inadequacies of the refund obligation as a protection of the public interest (*F.P.C.* v. *Tennessee Gas Transmission Co.*, 371 U.S. 145, 154, 155 (1962); *F.P.C.* v. *Hunt*, 376 U.S. 515, 524 (1964)). Without the moratorium we have provided the public interest could be protected only to the extent that the Commission could devise procedures to enable it to complete an area proceeding within the 5-month suspension period or shortly thereafter. See *F.P.C.* v. *Tennessee Gas Transmission Co., supra; cf. Panhandle Eastern Pipe Line Co.* v. *F.P.C.*, 236 F. 2d 606 (CA3–1956).

While the Supreme Court's description of a Section 5 producer rate proceeding in the *Catco* case as "well nigh interminable" is, we hope, no longer apt, the more than four-year history of this case, conducted with acute awareness of the running of time, demonstrates that we are dealing with inherently time-consuming proceedings. We expect to complete future area cases in much less time, but we would be unrealistic in the extreme to assume that any rate proceeding could be completed in less than several times the length of the 5-month suspension period. Without the limited moratorium on rate filings prescribed by our order herein this mammoth proceeding would fix prices for only a 5-month period and the producers could then overturn the Commission's order by a series of new filings to reinstate their pre-existing rates.

It is our view that the filing of rate increases by a natural gas company pursuant to Sections 4(d) and (e) can be limited either by private contract or as a result of the reasonable exercise of this Commission's authority under Sections 5, 7, and 16 of the Act. Certainly, it would be an anomalous situation if the filing of rate increases could be restricted by private bargaining but not by reasonable exercise of regulatory authority in the public interest. We have exercised such authority in this initial proceeding fixing rates on a group basis under the Natural Gas Act because it is an essential feature of the area approach if it is to achieve effective control over producer prices for the protection of consumers. We believe the 2½ year period is the minimum time required to afford price stability that will be beneficial to consumers and the industry as well. Considering the evidence of stable costs, and the provisions for earlier relief, if warranted, this limited moratorium is not unfair to producers.

The producers nevertheless contend that pursuant to the provisions of Section 4(d) of the Act, a natural gas company has a right to file any contractually authorized rate increase even if the Commission has just held that the maximum just and reasonable price for such sale is of a lesser amount. They argue that the only procedure available to the Commission is to enter into the suspension and hearing procedure established by Section 4(d), with the company having the right to put the increase into effect subject to refund at the end of the maximum statutory five months' suspension period.

We do not believe that the Commission's powers are so limited that its regulatory efforts must be futile where after a long and full hearing we have determined the just and reasonable rates to be set for the future. The *Mobile* case (*United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 339 (1956)) made clear that:

> * * * § 4(d) is simply a prohibition, not a grant of power. It does not purport to say what is effective to change a contract, any more than § 4(c) purports to define what constitutes a "contract" that may be filed with the Commission. The section says only that a change *cannot* be made without the proper notice to the Commission; it does not say under what circumstances a change *can* be made * * * [emphasis in original]

It is true that despite the Court's explanation of the meaning of Section 4(d) as simply a prohibition on filings, and not a grant of power, the opinions of the Court in *Mobile* and in the subsequent *Memphis* case (*United Gas Pipe Line Co.* v. *Memphis Light, Gas & Water Division*, 358 U.S. 103 (1958)), contain dicta to the effect that a pipeline can file for such increases as are contractually authorized and after the suspension period, put them into effect subject to refund. See also *Atlantic Refining Co.* v. *Public Service Commission of New York* (CATCO), 360 U.S. 378 (1959). These dicta must be read in context of the issue raised in the cases, which was the effect of restrictions on increased rate filings by pipelines stemming from contractual limitations by the parties in circumstances where the pre-existing rate had not been fixed by the Commission pursuant to its authority to prescribe just and reasonable rates for the future. These cases dealt with regulation on an individual company basis in which there is a long administrative history of permitting increased rate filings and where the Commission as a matter of policy has never written a moratorium into a rate order. They are entirely consistent with our recent order in *United Gas Pipe Line Co.*, Docket No. RP65-1, 32 FPC 1164, issued October 22, 1964, where in refusing to reject an increased rate filed by a pipeline we made clear that "the Commission is [not] completely without discretion to impose by rule or by order a reasonable moratorium on the filing of rate increases under Section 4(d) of the Act in circumstances where the orderly administration of the Natural Gas Act makes such conditions necessary."

The authority we assert herein is neither novel nor unique as applied to group rates set after full agency hearing. The ICC operating under a statute containing language virtually identical to Section 4 of the Natural Gas Act long ago stated that "to say that the Commission's order may be defeated merely by publication and filing of a rate higher than that prescribed by the order is to say also that the shipping public is not entitled to the protection of this Commission's orders during the period they are in force * * *." (*City of Springfield, Tenn.* v. *Louisville N.R. Co.*, 53 ICC 603, 605, 606 (1919); see *Fifteen Per Cent Case*, 45 ICC 303 (1917).) The CAB has similarly held that a group rate fixed by the Board could only be modified by subsequent Board action and not by a carrier's unilateral filing. *Minimum Rates Applicable to Air Freight* Order No. E-17370, 34 CAB 263 (1961).

The Supreme Court has expressly held in *United States* v. *Corrick*, 298 U.S. 435, 439, 440 (1936), that where the Secretary of Agriculture under the provisions of Section 310 of the Packers & Stockyards Act (7 U.S.C. § 211 (1921)) prescribes "the just and reasonable rate or charge, * * * to be thereafter observed" such rates "become the only lawful rates and so remain until further order of the Secretary" and cannot be altered by the unilateral action of a particular marketing agency pursuant to provisions of Section 306 of the Packers & Stockyards Act (7 U.S.C. § 207). That section is virtually identical with Section 4 of the Natural Gas Act.

It cannot be argued that the ICC and Packer & Stockyards Acts precedents are not in point because those acts expressly provide that orders fixing just and reasonable rates "shall continue in force until [the agency's] further order" (see *Interstate Commerce Act*, § 15(2), 49 U.S.C. § 15(2); (1887); *Packers & Stockyards Act*, § 313, 7 U.S.C. § 214). The ICC adopted the position noted above before the language in question was introduced into its Act in 1920[47] and the Supreme Court in *Corrick* supported its conclusion not by reference to the different language of Section 313, but by the quoted language of Section 310 which parallels Section 5(a) of the Natural Gas Act and by citing its earlier decision in *Arizona Grocery Co.* v. *Atchison T. & S.F. Ry Co.*, 284 U.S. 370 (1932), standing for the general proposition that where the agency "declares a specific rate to be the reasonable and lawful rate for the future, it speaks as the legislature and its pronouncement has the force of a statute" (284 U.S. at p. 386).

The absence in the Natural Gas Act of language similar to that found in Section 15(2) of the Interstate Commerce Act and Section 313 of the Packers & Stockyard Act, means only that Commission orders under Section 5(a) do not automatically have the effect of tolling the availability of Section 4 filings (see *United Gas Pipe Line Co., supra*). It leaves the Commission free to exercise its express authority to "fix" by order "the just and reasonable * * * rule, regulation, practice or contract to be thereafter observed and in force" (Section 5(a)) and to "perform any and all acts and to prescribe * * * such orders, rules and regulations as it may find necessary or appropriate to carry out the provisions of this act" (Section 16); See *Public Service Commission of New York* v. *F.P.C.*, 327 F. 2d 893, 896–897 (CADC–1964).

The Commission under Sections 5(a) and 16 of the Natural Gas Act may impose a reasonable moratorium on increased rate filings under Section 4 which are inconsistent with the just and reasonable rates found after hearing, and require that during this period the just and reasonable rates be changed, if at all, solely by modification of its original decision after appropriate proceedings held in that docket. The orderly administration of the Natural Gas Act necessitates that we exercise such authority in fixing the rates for sales by gas producers on an area basis.

It will therefore be our policy to certificate new sales of gas in the future at initial prices no higher than the just and reasonable price for new gas, and upon condition that no increased rate higher than the ceiling price be filed before January 1, 1968 (a 2½-year period which we believe to be the reasonable duration for a moratorium on filings for rates higher than the ceiling prices fixed on the basis of this record), unless within such time, either upon the Commission's own motion or upon an adequately supported petition by some interested party, the Commission at its discretion decides to reopen this proceeding to consider whether a different rate or rates should be adopted for sales certificated at subsequent periods. We expect that the just and reasonable rate for new

[47] *Cf.* Section 4 of the *Hepburn Act of 1906* (34 Stat. 589) with Section 418 of the *Transportation Act of 1920* (41 Stat. 484).

gas would constitute the maximum price at which new gas would be initially certified, the so-called "in-line" price, until the just and reasonable rate is changed by the Commission.

As to existing sales, whether they fall within the categories to which the flowing gas or new gas-well gas rates are applicable, we shall, pursuant to our authority under Sections 5 and 16 of the Act, similarly provide against any filing of rate increases above the applicable ceiling price fixed herein before January 1, 1968, but will permit any interested party within such period to file a petition directed to the Commission's discretion, showing why it believes the proceedings should be reopened to consider earlier changes. The Commission reserves the right to reopen the proceeding in its discretion to permit earlier changes in rates in the event of drastically changed circumstances. In any event after the 2½-year period, we shall also permit contractually authorized rate increase filings to be made pursuant to Section 4 for all sales in the area.

MINIMUM RATES

The examiner found that certain contracts in the Permian Basin were "below the revenue standards" he adopted. While the record is not clear on this point many of these contracts presumably were negotiated at a time when natural gas was a by-product of the search for oil and the interstate markets had not yet developed.

To aid in rectifying the situations where producers had contractually precluded themselves from obtaining an increase in price of their gas, the examiner authorized the seller, with the consent of his buyer, to increase his rates up to the minimum established in the decision; to wit, 9 cents per Mcf of gas-well gas and 7 cents per Mcf for casinghead gas.

The Supreme Court in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956),[48] recognized that this Commission possesses the power to authorize rate increases despite contractual limitations to the contrary. However, the Court was careful to point out that such an order required as a foundation more than the mere fact that, because of an improvident bargain, a utility was receiving less than a fair price for its product. The Court said (at p. 355): "In such circumstances the sole concern of the Commission would seem to be whether the rate is so low as to adversely affect the public interest—as where it might impair the financial ability of the public utility to continue its service, cast upon other consumers an excessive burden, or be unduly discriminatory."

It is thus clear that the test of whether rates should be increased is not one of private equities but of the public interest. It is also clear that the examples set forth by the Court are not, and were not intended to be, the only instances where public interest would justify an authorization to increase rates in contravention of a contract. In addition it should be noted that the *Sierra* case was decided in the context of an individual company rather than an area rate approach.

We concur with the examiner in his conclusion that the establishment of minimum rates in this case is in the public interest and that the price impact on the consumer will be *de minimis*. While on the one hand, the establishment of a maximum price for the area is essential so that the ultimate consumer does not pay a price which is excessive in relation to group costs and other relevant considerations, we believe that a minimum price also constitutes an integral part

[48] Though this case involved the Federal Power Act, the Court noted that: "The pertinent provisions of the Federal Power Act, * * * are §§ 205(c), (d), and (e), and 206(a), which are substantially identical to §§ 4(c), (d), and (e), and 5(a), respectively, of the Natural Gas Act." (at pp. 350–351)

of the area rate approach. The rate received by a producer must not be so low as to prevent or retard further exploration and thereby decrease possible discovery of gas reserves which will be needed by consumers. The amount of additional revenue so provided, at the most $250,000 annually, will have no significant impact on consumers but the relief afforded the individual producers involved may be important to their continuation in the search for additional gas supplies needed to meet the growing needs of the consuming markets.

Although we have agreed with the examiner's conclusion as to the need for a minimum rate, we believe that his remedy, which would not allow the producer with sub-minimum rates to raise them to the minimum unless he secured the approval of his purchaser, is not sufficient. Renegotiation of contracts resulting in increased rates which do not exceed the area rate would be proper without any action by this Commission, so that the examiner's remedy would avail nothing.

We therefore deem it necessary and appropriate to establish a minimum rate in this area of 9 cents per Mcf for gas of standard pipeline quality, with adjustments from the minimum price to reflect any deviations from the quality standards established herein, and to hold that the minimum rate herein established may be filed without purchaser approval at any time after this order becomes final.

REFUNDS

We shall require appropriate refunds in the case of rates which are the subject of proceedings under Section 4(e) of the Act, and have thus been collected subject to an obligation to refund amounts collected in excess of the just and reasonable rates as here determined. In each case the proper rate level for computing refunds shall be the area rate applicable to the particular category of gas involved, as adjusted by reason of any quality deviations in the particular gas.

The presiding examiner proposed that the total refunds to be made with respect to contracts for the sale of gas-well gas should be computed for each separate year on the basis of whether the industry as a whole had collected an excessive amount for gas-well gas in that year. Under this proposal, if one producer collected revenues from the sale of gas-well gas in excess of his proper prices, he would be required to refund such excess amounts only if it were shown that in the industry as a whole in that year had received revenues from gas-well gas in the area in excess of the proper revenues for such gas. The same principle would be applied with respect to residue gas and to casinghead gas. Further, any deficiency in any year in overall industry revenues from any one of the three categories—gas-well gas, residue gas, or casinghead gas—would be used to offset excessive revenues collected for any other category of gas.

The underlying theory of the presiding examiner's approach is that refunds should be ordered only to the extent that overall industry revenues exceed overall industry expenditures in a given year. The briefs on exceptions indicate that many of the parties are not clear as to how this theory might be applied in particular cases.

Several, fundamental objections preclude adoption of the examiner's proposed method of computing refunds. We think it would result in inequities among wholesale customers as well as among individual producers. If one wholesale customer has been overcharged it is of little comfort to him to know that another customer has received a bargain. Conversely, if one producer has collected excessive amounts, he should not be relieved of his responsibility to return the excess by reason of the fact that some other producer collected too little. Fur-

thermore, the administrative difficulties involved in attempting for each year, and each category of sales, to equate industry revenues with industry expenditures, and to allocate the excess revenues among the purchasers, seem almost insurmountable.

We have established just and reasonable ceiling prices for the Permian area, with adjustments from the ceiling prices in the case of gas which deviates from the quality standards we have established. The applicable ceiling price, including any quality adjustments, is the proper price for gas sold under a particular contract. We think it is proper and equitable to require refunds of amounts collected in excess of the ceiling price for gas sold under each contract. This has been our practice in prior proceedings under the Natural Gas Act, and on this record we see no reason, legal or equitable, to fail to return to the wholesale customers the excess sums they have paid. To the extent that any producer receives a lesser amount than our ceilings permit it is because he has agreed to prices which yield that amount or failed to file for a higher rate.

Refunds will be required only with respect to the rates which are the subject of Section 4(e) proceedings, and only for the periods during which such rates have been collected subject to refund.

A refund procedure must be established. We have determined that price adjustments corresponding to departures from standards shall be left to the parties for initial determination, if they are able to agree. The price applicable to particular gas cannot be finally determined until the parties have determined the quality of gas and the computed corresponding price adjustments. Accordingly, each producer (except small producers, who will be considered below) shall file a computation of refunds due with respect to each rate schedule within 30 days from the date of the filing of an agreement with his purchaser as to the quality of the gas sold and the cost per Mcf of processing such gas to pipeline quality standards. If no such agreement is reached the refund computation is to be filed within 30 days from the date of Commission determination of the quality adjustments. (See *supra*, p. 225 hereof for procedure.)

In the case of Section 4(e) proceedings, the refund computation shall also be made for all periods during which rates were collected subject to refund. With regard to each rate schedule, such computation shall specify the applicable rate or rates as established in accordance with the principles set forth in this opinion (including any adjustments for quality as prescribed herein), the rate or rates collected during the period subject to refund, the period during which any rate was collected in excess of the proper applicable rate, the volume of gas for which such excess rate was collected, and the amount of refunds due. Interest on such refunds (at the prevailing rate) shall be included in the computation.

Each producer will be directed to retain the refunds to be made by him until further order of the Commission. Such retention shall be in accordance with the option principle established by the Commission in *Humble Oil & Refining Company*, 32 FPC 49, Docket No. G–9287, *et al.*, issued July 8, 1964.

The rates for small producer sales as defined in the rule providing for small producer certificates for such sales proposed this date are not required to reflect any quality adjustments either for past periods or for the future. Small producer refund obligations will therefore extend only to refunding amounts collected subject to refund in excess of the amounts collectible under the base ceiling rates. If a small producer wishes to take advantage of any permitted upward adjustment for new gas-well gas of high Btu content, he will be required to indicate also any offsetting deficiencies in quality of the gas in question by filing the same statements required of large producers.

SMALL PRODUCER PROBLEM

There have been many suggestions, foremost of which are those by Justice Clark, dissenting in *Wisconsin* v. *F.P.C.*, 373 U.S. 294, 329–30 (1963), and speaking for the Court in *F.P.C.* v. *Hunt*, 376 U.S. 515 (1964), to the effect that this Commission should consider procedures for the exemption of small producers from regulation. There are many compelling arguments to justify distinctive treatment of small producers. The justification goes beyond the obvious benefits of relieving the small producer of the expense and burden of the regulatory process. Among other considerations, expediting the administrative process and facilitating effective regulation are suggested as additional benefits.

The examiner has set forth a well documented argument for recognizing the special problems of the small producer and affording him separate regulatory treatment. At the very heart of his analysis are two basic propositions which serve to distinguish the small producer from the large. The first is simply a recognition of the characteristic of "smallness," which as the examiner has said means that the typical small producer has limited operations and is thus subject to a greater degree of risk than is a large producer.

The examiner's second proposition is that the small producers, although numerous, account for a relatively small share of the natural gas produced in this country, and that even without regulation they usually cannot obtain more for their gas than the regulated price we fix for the major producers. In the nation there are over 2,000 small producers as defined by the examiner, *i.e.*, those selling less than 10 million Mcf of gas per year, filing rate schedules with this Commission. They provide only about 15 percent of the total supply of natural gas moving in interstate commerce. The examiner concludes that the exclusion of the small producer from direct price control would thus have a *de minimis* impact on the consumer while the effect on the small producer would be highly beneficial. His procedural device for according exemption was a blanket finding that all the rates of the small producers were just and reasonable.

We agree with the examiner in general that special treatment of the small producer group offers scope for streamlining the regulatory process without the risk of substantial impact on consumer prices. Consumers and the natural gas industry alike have a strong stake in the continuation of the exploration efforts of the thousands of small operators, who contribute a large share of the discoveries of new sources of gas. Easing the burdens of regulation would help to assure their continued participation in the gas production business.

While we are convinced that there is need for distinctive treatment for small producers, which we shall provide herein, we do not believe it is necessary or desirable to provide outright exemption. We reach this conclusion assuming that exemption is legally permissible despite the mandatory language of Sections 4 and 7 of the Natural Gas Act.[49]

In our opinion the salutary objectives of those who propose exemption can better be achieved within the framework of regulation. Furthermore, any exemption for small producers would be more an allusion than a reality. As the small producers suggest, the area ceilings we prescribe will tend to set the maximum prices they can obtain for their gas.

---

[49] Section 4(a) states in part that "*all* rates and charges" by "any natural gas company shall be just and reasonable." In Section 4(c) it is stated that "Under such rules and regulations as the Commission may prescribe, *every* natural gas company shall file * * * in such form as the Commission may designate, * * * *all* rates and charges * * *."

Section 7(c) provides in part that "No natural-gas company * * * shall engage in the transportation or sale of natural gas, subject to the jurisdiction of the Commission * * * unless there is in force with respect to such natural gas company a certificate of public convenience and necessity * * *."

A basic consideration in reaching our conclusion in this matter is that the impact of small producer prices on consumers is by no means *de minimis* on an area basis, and is of great impact in some situations. Sales by small producers constitute 80 percent of the gas supply of one pipeline [50] and range from 9 percent to about 60 percent of the supply of the other 25 largest pipelines. While small producers represent only 15 percent of the aggregate interstate gas supply it is obvious they are a substantial factor in the cost of the gas supply of millions of American consumers.

Another consideration which weighs with us is that penetration of rate ceilings, even on a small scale, could be seriously disruptive of a pattern of uniform area ceilings.

The examiner suggested relief for small producers from present filing requirements in the following manner: (1) a general certificate would issue to those natural gas companies which meet the qualifications of a "small producer", and (2) such producers would be required to file annual statements containing information as to their jurisdictional sales. The small producers in this proceeding support these suggestions.

We are interested in affording real relief to the small producers and in providing meaningful measures to clear our dockets and facilitate effective regulation. We recognize the burdens to small producers of complying with the filing requirements promulgated pursuant to Section 7 of the Natural Gas Act before new gas supplies can be connected. Such filings, which are routinely handled by the larger companies can, in the case of a small producer, strain his resources. The time lag, even the few weeks required under our expedited procedures, can deprive a small producer of badly needed income. In light of these circumstances the Commission finds that it is necessary and appropriate to afford the small producers relief as provided below and we are issuing a notice of proposed rulemaking, this date, to implement our conclusions.

A small producer is thereby defined to be a natural gas company selling jurisdictionally less than 10,000,000 Mcf annually on a nationwide basis. Such a classification will include almost 250 of the filing producers in the Permian Basin and leave about 40 major companies subject to the filing requirements of Section 7 for individual sales. Nationally this breaking point would classify approximately 2,000 producers as small and about 75 as major companies. We believe that the record amply supports this reasonable classification made pursuant to Section 16 of the Act. For this purpose, the combined jurisdictional sales of affiliated companies (as further defined in the rule issued this date) will be considered as the sales of a single producer.

Companies or individuals in the Permian Basin qualifying as small producers will be granted small producer certificates pursuant to Section 7 of the Act authorizing all future small producer sales (as defined therein) in the area at or below the applicable area ceiling rate, thereby eliminating the need to obtain separate certificates for each sale as is presently required. This action will not only relieve the producers and the Commission of a large paperwork problem, it will enable small producers to bring their gas to market without any regulatory delay.

Sales in areas other than the Permian Basin by small producers will not be eligible for coverage by such certificates until an area rate is fixed therein because the determination of a specific area rate is a prerequisite for the issuance of such certificates.

All producers in the Permian Basin who apply and qualify as small producers under our proposed rule issued this date will be granted special certificates as to

[50] Kansas-Colorado Utilities Company, see its F.P.C. Form 2.

their Permian sales which will cover not only any future small producer sales (as defined therein) made within our area ceiling prices, but also all such sales for which a separate certificate has already been issued. Naturally, these certificates will be subject to the limit of 10,000,000 Mcf of annual jurisdictional sales on a nationwide basis and to area rate limitations. Those certificate applications within the ceiling pending before the Commission by small producers in the Permian Basin that come within the proposed rule will be covered within small producer certificates and any applications for certificates above ceiling will be granted conditionally upon acceptance of an initial price no higher than the ceiling.

Recipients of the small producer certificates will be required only to file annually a simple one-page statement in which they will state the total volume of jurisdictional sales and certify that all such sales were within the applicable area ceiling. The producers holding such certificates will no longer be compelled to file Forms 301–A or 301–B,[51] nor will they be required to file individual initial rate schedules pursuant to Section 4(c) of the Act for the small producer sales. Furthermore, in light of our decision to accept all rate increases up to the area rate, holders of small producer certificates will not hereafter be required, under Section 4(d) of the Act, to file such changes for their small producer sales as they are made. Section 4(d) requires such filings "Unless the Commission otherwise orders * * *." We believe that inclusion of information pertaining to these changes, in the annual reports of the pipeline purchasers, will satisfy not only the language but also the purpose of Section 4(d). Of course, no increases above the applicable area ceiling will be permitted without the approval of the Commission pursuant to the filing requirements of Section 4(d).

Should a producer cease to be a small producer by virtue of an increase of jurisdictional sales to a level in excess of 10,000,000 Mcf in a year, or should he propose to sell at prices above the area rate, or should he make sales which do not qualify as small producer sales he must abide by the present requirements, *i.e.*, his certificate will not apply to such situations. Specific details of the small producer relief are explained in the Notice of Proposed Rulemaking issued this date, *infra*, p. 434.

MISCELLANEOUS ISSUES

Favored-Nation and Spiral Escalation Clauses

The Presiding Examiner stated:

> * * * Most favored nations clauses and spiral escalation clauses cause price increases in a contract price to occur without reference to the circumstances or economics of the particular operation, but solely because of what happens under another contract. These clauses contravene the public interest and the basis on which prices have been determined in this decision. They are therefore declared to be inoperative and of no legal effect. No change in a rate resulting from such indeterminate pricing provisions will be permitted to take effect under this decision and order. (Initial Decision, *infra*, p. 373.)

The examiner correctly observed that most favored-nation clauses and spiral escalation clauses are not in accordance with the principles upon which a rate structure should be based. We have proscribed the filing of contracts containing such clauses executed on or after April 2, 1962. (Order No. 242, 27 FPC 339; *F.P.C.* v. *Texaco Inc.*, 377 U.S. 33.) We do not think, however, that such clauses

[51] Presently required by the Regulations under the Natural Gas Act, Sections 260.5 and 260.6.

in contracts already accepted for filing at the time of our order outlawing such clauses for the future should be denied effect insofar as they serve to permit filings up to the applicable area prices prescribed herein. When the contracts containing such clauses were negotiated such clauses were a part of the bargain arrived at between the parties. Had they been proscribed at that time, escalation clauses of permissible types might well have been substituted. In any event there is no reason in the public interest to prevent rate adjustments which will permit producers to collect a just and reasonable price for their gas. These indefinite escalation clauses will, of course, like all other escalation clauses, be subject to the moratorium provisions discussed *supra* at pp. 227–231 and, as the examiner ruled, such clauses will not be permitted to authorize rate filings above the applicable area rates subsequent to the expiration of the moratorium period.

Application of the Order

This proceeding, instituted under Section 5(a) of the Natural Gas Act, will determine the just and reasonable rates to be hereafter observed and in force for all jurisdictional sales being made under respondents' rate schedules. Such rates will apply as ceilings to all sales of respondents whether they were being made at the time we instituted this proceeding or were begun subsequent thereto. Certain of the respondents argue that our order cannot apply to rates established in contracts filed by such respondents after this proceeding was instituted. The argument has no merit. The evidence in this proceeding is based on a composite showing of the overall production in the area and fixes an area rate specifically designed to be just and reasonable for all jurisdictional sales in the area.

To hold otherwise would require an unending succession of Section 5 area rate proceedings, each covering only the sales instituted prior to the institution of the proceeding. We are not required to engage in any such massive duplication of effort. This proceeding was instituted to determine the just and reasonable rate or rates for the sales of natural gas produced in the Permian Basin subject to the jurisdiction of the Commission (Ordering Paragraph "A" of Order Instituting Hearing, 24 FPC 1121 (1960)). Consistent with the provisions of Section 5(a) of the Act, our Order will apply to all of respondents' sales in the described area. (See *United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 341 (1956).)

A few certificates have been issued since the institution of this proceeding authorizing sales in the Permian area by persons not respondents in this proceeding. Our Order here will not apply to these sales, but the parties making such sales will by separate order be directed to show cause why the area rates should not be applied to them.

Finally, with respect to certain of respondents' sales, increased rates have been filed subsequent to the institution of this proceeding and the dockets involving such increased rates (collected subject to refund) have not been consolidated herein. The above-stated reasons why our determination should apply to newly certificated sales is equally applicable to these nonconsolidated increased rate filings and the record in this proceeding would appear to be adequate to determine the rates to be hereafter collected for these sales and to determine refund obligations. However, the dockets involving the increased rates were not consolidated herein and the respondents have not been afforded a hearing respecting their refund obligations. Accordingly, we shall not order

refunds in these dockets but instead institute a separate proceeding requiring respondents to show cause why the rates here determined should not be utilized in determining their refund obligations.

Examiner's Witness Frazier

Continental (Brief on Exceptions, p. 78) on behalf of the Major Producer Group contends that the presiding examiner improperly called as his own witness Charles H. Frazier, then Director of Development for the Philadelphia Gas Works Division of The United Gas Improvement Company, and that he used Mr. Frazier's testimony as the basis for the dual pricing system, his pricing and location differentials, and rate design. The Major Producer Group argues that the burden of proof is the Commission's and that in the Section 5 part of the proceedings, it is well-settled that the commingling of the investigatory and adjudicatory phases of an administrative proceeding violates due process of law and the specific requirements of the Administrative Procedure Act. They note that Section 1.30(f) of our Rules, like Section 5 of the Administrative Procedure Act, provides that one engaged in the investigatory phase must not participate in the decisional process.

It should first be observed that neither Section 5(c) of the Administrative Procedure Act nor Section 1.30(f) of our Rules by its terms applies in rate proceedings. Thus, even if it were assumed that the examiner in calling his own witness was acting in an "investigative" role, he did not violate either the Act or the Rules. More important, however, the examiner's action was not "investigative" but a proper function of the trial examiner in a hearing. Both the Senate and House Committee Reports on the Administrative Procedure Act expressly point out that hearing officers "have the authority and duty—as a court does—to make sure that all necessary evidence is adduced."[82] The Act confers authority for what the examiner has done (see Section 7, *passim*). We also note that the State courts have approved the action of a judge in calling his own witness. *Ramsey* v. *Mading*, 217 P. 2d 1041 (Wash, S.Ct.); *Hunt* v. *State*, 248 Ala. 217, 27 So. 2d 186, 193; and *People* v. *Rotello*, 339 Ill. 448, 171 N.E. 540, 542. See also 9 Wigmore, Evidence 267–270; 3 Wigmore, Evidence 151–153; 4 Jones, Evidence 1685.

It is suggested that Witness Frazier may have had an interest in the proceeding because his employer, a gas distributor, though not a party in this proceeding, is an intervener in other area proceedings. This point, however, only goes to the weight to be given his testimony, not its admissibility. If interest in the proceeding were a disqualification most of the evidence in this case would be stricken. See 4 Jones, Evidence, 1865–1966.

Witness Frazier's background and employment status were well known at the time he was called and are a matter of record. Respondents were given a full opportunity to cross-examine Frazier and to bring out anything which would impeach him either by way of challenge to his qualifications as an expert witness or challenge to his views because of his interest. His testimony, of course, is entitled to no more credence because he was called by the examiner rather than by a party. We conclude that the calling of Witness Frazier was proper and has not been shown to have resulted in any prejudice to respondents.

The Commission further finds:

(1) Each of the respondents listed in Parts I and III of Appendix A to this opinion is, and at the time of all past sales with which we are here concerned was, a natural gas company within the meaning of the Natural Gas Act and

[82] Sen. Doc. No. 248, 79th Cong., 2d Sess., page 207. See also House report at page 268.

is engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption, subject to the jurisdiction of this Commission.

(2) Past, present, and proposed sales of natural gas to which the order herein applies are subject to the jurisdiction of this Commission.

(3) Rates for all sales of natural gas, by the producers in Texas Railroad Districts 7–C and 8 and New Mexico counties Lea, Eddy, and Chavez which are respondents herein, that are above the applicable area rates prescribed herein, have not been shown to be just and reasonable or otherwise lawful under the provisions of the Natural Gas Act and should be disallowed, and refunds should be required as hereafter provided.

(4) The just and reasonable rates for past, present, and proposed sales of natural gas to which this order applies are the applicable area rates set forth in ordering paragraphs (A) and (B) below.

(5) It is necessary and appropriate and in the public interest to establish minimum rates as provided in ordering paragraph (G) for all natural gas produced in the Permian Basin.

(6) Contracts providing for rates in excess of the applicable just and reasonable rates determined herein or below the minimum rates herein established are in that respect unjust and unreasonable.

(7) The moratorium until January 1, 1968, upon the filing of price increases above the just and reasonable rates established herein is necessary to the practical administration of area rate ceilings and the effective price regulation of natural gas producers.

(8) Except as herein granted the exceptions to the initial decision and proposed order should be denied.

The Commission orders, pursuant to Sections 4(e) and 5(a) of the Natural Gas Act:

(A) *The Base Area Rates*

The following base area rates are hereby established, as of the effective date hereinafter defined, as the just and reasonable rates for sales of gas for resale in interstate commerce by the respondents in this proceeding, subject to any applicable adjustments for quality as provided in ordering paragraph (B) hereof:

(1) For new gas-well gas, as defined in this opinion, sold and to be sold pursuant to contracts executed on or after January 1, 1961, and any residue gas derived therefrom:

a. In Texas Railroad Districts No. 7–c and 8—*16.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico—*15.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

(2) For gas-well gas, sold and to be sold pursuant to contracts executed before January 1, 1961, and any residue gas derived therefrom, and for all casinghead gas and any residue gas derived therefrom sold and to be sold:

a. In Texas Railroad Districts No. 7–c and 8—*14.5 cents per Mcf* (at 14.65 psia).

b. In Lea, Eddy and Chaves Counties in New Mexico—*13.5 cents per Mcf* (at 14.65 psia) plus the applicable state and local production taxes in effect on the effective date hereinafter defined.

(B) *Quality Standards and Adjustments to the Base Area Rates*

(1) The base area rates fixed in ordering paragraph (A) herein shall be adjusted for any deviations from the standards for pipeline quality gas in

Texas Railroad Districts Nos. 7–c and 8, and in the New Mexico counties of Lea, Eddy and Chaves, which are hereby established as follows:

a. *Carbon Dioxide:* Pipeline quality gas shall contain not more than 3 percent carbon dioxide by volume.

b. *Hydrogen Sulphide:* Pipeline quality gas shall contain not more than 10 grains of hydrogen sulphide per Mcf of natural gas at 14.73 psia and 60° F.

c. *Total Sulphur:* Pipeline quality gas shall contain not more than 200 grains of total sulphur per Mcf of natural gas at 14.73 psia and 60° F.

d. *H_2O:* Pipeline quality gas shall contain not more than .009 pound of H_2O per Mcf of natural gas at 14.73 psia.

e. *Other Impurities:* Pipeline quality gas shall contain no oxygen, dirt, dust, gum, or other impurity in sufficient amounts to require the buyer to incur processing costs to eliminate such impurities in order for the gas to meet either customary commercial standards or the customary requirements of any of the interstate pipelines in the area.

f. *Pressure:* Pipeline quality gas shall be delivered at a pressure of not less than 800 pounds per square inch.

g. *Btu Adjustment:* (For new gas-well gas only). The maximum standard will be 1,050 Btu's per cubic foot at 14.73 psia and 60° F. and the minimum standard will be 1,000 Btu's per cubic foot at 14.73 psia and 60° F. Upward and downward adjustments of the base area rates will be permitted on a proportional basis as specified at pages 223, 224 of this opinion if the Btu content exceeds the maximum standard or is below the minimum standard.

(2) When a purchaser buys gas which deviates from the quality standards established in subparagraph (1) above, the base area rate fixed in ordering paragraph (A) shall be adjusted for any deviations from such standards as follows:

a. The applicable base area rate shall be adjusted downward by the net cost of processing the gas to bring it up to standard.

(i) If the processing is performed by the purchaser, a reasonable return upon the net investment should be included as part of the processing cost incurred in bringing the gas up to pipeline quality.

(ii) If processing reduces the volume of the gas, the purchaser shall pay for only the volume remaining after processing.

b. The applicable base area rate for new gas-well gas only shall be adjusted downward or upward by the amount of any applicable Btu adjustment and by the concomitant amount of any saving or additional expenses to the seller from any reduction or increase in taxes or royalty payments resulting therefrom.

(C) Applicable area rate, as that term is used herein, shall mean the base area rate established by ordering paragraph (A) or the rate determined after adjustment, if any, of that base area rate for the deviations from the quality standards established by ordering paragraph (B).

(D) The applicable area rate as defined in ordering paragraph (C) above, shall be effective from and after the effective date hereinafter defined and any amounts collected in excess thereof from and after such effective date shall be subject to refund plus interest at 7 percent. In addition, with respect to the rates involved in the Section 4(e) proceedings set out in Part III of Appendix A, the applicable area rate as defined in paragraph (C) above, shall be effective from the date such Section 4(e) rates were collected subject to refund and all amounts collected under those Section 4(e) rates in excess of the applicable area rate shall be subject to refund from the date such excess was collected plus interest at the rate specified in the respective Section 4(e) proceeding, in accordance with the provisions of ordering paragraphs (I) and (J) herein.

(E) Within 45 days from the effective date hereinafter defined each respondent shall file a supplement to each applicable rate schedule, effective as of the effective date hereinafter defined, reflecting any reductions required to bring any or all of its rates into conformity with the applicable base area rate established by ordering paragraph (A) herein.

(F) (1) Within 90 days from the effective date hereinafter defined, each respondent listed in Part I or Part III to Appendix A (except those exempted by subparagraph (3) hereof) shall file with the Commission a statement in conformity with Appendix D to this opinion for each rate schedule such respondent has on file with this Commission for the sale of natural gas produced or sold within Texas Railroad District No. 7–c, Texas Railroad District No. 8, or the New Mexico counties of Lea, Eddy or Chaves. Such statement shall set forth either that the gas accords with all pipeline quality standards established herein, or in which respects the gas deviates from the particular quality standards established herein; the agreed cost to the purchaser of processing the gas to bring it to the pipeline quality standards established herein with respect to each quality deviation; any upward or downward Btu adjustment for new gas-well gas; and the resulting applicable area rate for the gas. Such statement shall be signed by both the seller and the purchaser. If the seller and the purchaser are unable to agree upon any or all of the particulars entering into the computation of the applicable area rate, the seller shall file the statement herein required which shall indicate the absence of agreement and supply the information required to compute the applicable area rate as well as the contentions of the parties with respect to the quality and amount of the adjustment for any item in dispute. The purchaser may file a separate statement setting forth its views within the period herein provided.

(2) The statement filed hereunder which reflects full agreement between seller and purchaser shall be deemed accepted by the Commission unless the Commission, within 60 days after such filing, shall otherwise order. In the event of disagreement between the seller and purchaser or, where the Commission otherwise determines that the statement filed is inconsistent with the provisions of ordering paragraph (B) herein, the Commission will, after appropriate proceedings, prescribe the applicable area rate to be applied as of the effective date hereinafter defined.

(3) Any respondent listed in Part I or Part III to Appendix A is exempt from filing the statement required by subparagraph (1) hereof for any sales which are "small producer sales" as defined in the rule providing for small producer certificates proposed this date, if within 45 days from the effective date hereinafter defined such respondent files the information requested in Appendix E to this opinion required to qualify for a small producer certificate for such sales. If the Commission subsequently finds that such a producer does not qualify as a small producer such applicant shall be required to file the statement required by subparagraph (1) hereof within 90 days after any such Commission finding.

(G) *Minimum Rates*

(1) Minimum rates for natural gas produced in the Permian Basin area are hereby established as follows:

For gas meeting all pipeline quality standards *9 cents per Mcf* at 14.65 psia.

For gas not meeting all pipeline quality standards as established herein *9 cents per Mcf* reduced by the amount of any adjustments for quality as provided in ordering paragraph (B).

(2) All respondents who are currently making sales subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7–c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or Chaves,

are hereby authorized to apply for increases to the minimum rates fixed in subparagraph (1) hereof. Such applications shall be accompanied by the information required in Appendix D to this opinion, signed by the seller (or the agent or operator). Increases to the established applicable minimum rate will be granted notwithstanding contractual provisions to the contrary which are hereby modified *pro tanto*.

(H) *Moratorium on Rate Increases*

No respondent listed in Part I and Part III of Appendix A to this opinion shall file any change in rate providing for a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier. All contracts of the respondents listed in Part I of Appendix A relating to sales of natural gas subject to the jurisdiction of this Commission and produced in Texas Railroad District No. 7–c, Texas Railroad District No. 8, or any of the New Mexico counties of Lea, Eddy or Chaves shall be deemed amended, pursuant to Section 5(a) of the Natural Gas Act, by the inclusion of the following language:

From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding, AR61–1 (therein defined as September 1, 1965), until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission for a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission.

(I) *Refund Reports*

Within 120 days from the effective date hereinafter defined a refund report shall be filed with this Commission in triplicate by each respondent involved in one or more of the Section 4(e) proceedings set out in Part III of Appendix A to this opinion. The report shall set forth the following information (if more than one rate schedule is involved the respondent shall supply the information for each schedule separately):

(i) The rate collected during the period subject to refund, and the periods during which each rate was collected.

(ii) The volume of gas sold at each such rate.

(iii) The difference between the total amount collected during the period subject to refund and the applicable area rate as defined herein. If seller and buyer do not agree upon the items necessary to the computation of said rate, the seller shall make this computation on the basis of the information supplied by the seller in the statement required by ordering paragraph (F) subject, however, to the terms of subparagraph (2) thereof.

(iv) The interest, at rates as specified in each Section 4(e) proceeding, on the amount collected during said period in excess of the applicable area rate. The interest shall be calculated to the date of the report.

(J) *Treatment of Refunds*

Each respondent shall retain the amounts shown in the report required under ordering paragraph (E) subject to further order of the Commission directing the disposition of those amounts. If a respondent elects to commingle these retained refunds with its general assets and use them for its corporate purposes, and after notice to the Commission it is specifically authorized so to do, it shall pay interest thereon at the rate of 4.5 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If a respondent elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, condi-

tioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such person or persons as may be identified and designated by final order of the Commission and in such manner as may be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and reinvest such deposits in any short-term indebtedness of the United States of any agency thereof or in any form of obligation guaranteed by the United States which is respectively payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary quarterly, certifying the amount deposited in the trust account for the quarterly period.

(K) No respondent shall file hereafter any change in rate providing for a price in excess of the applicable area rate where the contractual right to such filing is based upon any contractual provision which would not be permitted by subsections (a), (b) and (c) of Section 154.93 of the Regulations under the Natural Gas Act.

(L) Notwithstanding the issuance of this final order, these proceedings shall remain open for such further action as may be necessary with respect to individual respondents and such other action as may be necessary in the premises.

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

(N) The date of issuance of this opinion and order within the meaning of Section 19(a) of the Natural Gas Act is the date shown on *supra*, p. 159 of the opinion immediately below the title thereof. The term "effective date herein after defined" (as it is used in the ordering paragraphs herein) is September 1, 1965.

Commissioner O'Connor *concurring* and *dissenting* on limited issue.

Commissioner Ross *concurring* and *dissenting* on limited issue.

Commissioner Black *concurring.*

Commissioner Bagge *not participating.*

O'CONNOR, *Commissioner, concurring and dissenting on limited issue:*

The Commission's decision issued today is a significant event in the evolution of our area rate policies, and, on the basis of the record before us, it establishes

just and reasonable rates for natural gas producers in the Permian Basin. It is my opinion that our extensive investigation has been synthesized into a meaningful system of regulation, and, for the purposes of our initial area proceeding, I endorse the consideration of costs. The cost analysis we utilize is a useful and proper determination of the financial requirements of the industry, and the results are defensible. I therefore concur in the Commission's opinion, including, of course, the procedures for implementation of the rates we establish; my dissent is limited to one issue.

While I join for present purposes, I am convinced that the experience gained in this costly and expansive proceeding justifies a simplification of the trial and disposition of future area proceedings. Price control being our objective, it is clear that the interests of producers and consumers can be adequately protected under expedited procedures based upon reasonable market prices. The record in this case fully establishes that the contract price at which most producers are able and willing to operate is just and reasonable. This standard provides the measure of inducement that has been successful in providing an excellent source of energy for use in all sectors of the Nation. Thereby, any policy that focuses on profits realized, as recommended by some parties before us, would be avoided, and the focus would be on supply elicited, which policy we here endorse. Furthermore, it is preferable to tolerate such imperfections as might result from area regulation in the interest of avoiding complicated cost-plus methodology.

The contract price is the measure of inducement. Composite costs best serve as a check on average field prices to preclude significant price departures. Our judgment should rest primarily on the market place where we can rely on competition to determine just and reasonable rates. In the hope that they will become the rule, I herein express my additional views and recommendations.

PRELIMINARY CONSIDERATIONS

In 1954 the Supreme Court made the unexpected determination that this Commission has jurisdiction over the interstate sales of natural gas producers and that it has a corresponding obligation to regulate those sales in the public interest. For fourteen years prior to that decision the Commission had repeatedly rejected the jurisdictional argument, and, due to the obvious difficulty of the task, the Commission had regularly recommended legislation granting only limited regulation over producers. In 1956 the Congress acquiesced in this view by approving such legislation, only to see it rejected by Presidential veto for reasons totally removed from the merits of the bill itself. Today, more than a quarter-century after the Natural Gas Act was adopted, and eleven years after this Commission was granted jurisdiction over producer sales, a decision has been reached which accommodates to an intent that prices for natural gas be regulated. However, although the law compels an embarkation into price control during peacetime, it does not dictate a single methodology, and herein lie my separate recommendations for future area decisions.

The task of selecting a reasonable approach to regulation that will reflect the practical necessities before us is a difficult one, but cognizance of several factors will make an acquittal of the duty more meaningful. The production of natural gas is an industry in which there is an intricate interplay of special market circumstances. Pipeline control over field prices presents awesome monopsonistic powers. Problems of waste and correlative rights compel state conservation regulation. Shared problems with oil lead to an overlapping of economic interests. Public utility characteristics at the transmission and distribution end go so far as to generate demands for price controls over the producing industry. The ab-

sence of traditional public utility characteristics in the production of natural gas presents problems that are directly antithetical to the transmission or distribution of the commodity; there is not the same direct relationship between investment and output at the crucial focus of the individual company, and there is certainly no legal obligation to provide new services. Reflecting these multifarious consideration, Justice Jackson observed, "If natural gas rates are intelligently to be regulated we must fit our legal principles to the economy of the industry and not try to fit the industry to our books." *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, 650 (1944). In that opinion he emphasized,

> Is it necessary to a "reasonable" price for gas that it be anchored to a rate base of any kind? Why did courts in the first place begin valuing "rate bases" in order to "value" something else? The method came into vogue in fixing rates for transportation service which the public obtained from common carriers. The public received none of the carrier's physical property but did make some use of it. The carriage was often a monopoly so there were no open market criteria as to reasonableness. The "value" or "cost" of what was put to use in their service by the carrier was not a remote or irrelevant consideration in making such rates. Moreover, the difficulty of appraising an intangible service was thought to be simplified if it could be related to physical property which was visible and measureable and the items of which might have market value. The court hoped to reason from the known to the unknown. But gas fields turn this method topsy turvy. Gas itself is tangible, possessible, and does have a market and a price in the field. The value of the rate base is more elusive than that of gas. It consists of intangibles—leaseholds and freeholds—operated and unoperated—of little use in themselves except as rights to reach and capture gas. The value lies almost wholly in predictions of discovery and of price of gas when captured, and bears little relation to cost of tools and supplies and labor to develop it. Gas is what Hope sells and it can be directly priced more reasonably and easily and accurately than the components of a rate base can be valued. Hence the reason for resort to a roundabout way of rate base price fixing does not exist in the case of gas in the field. 320 U.S. 647–648.

Regulatory authority must be employed as the characteristics of the industry dictate. Congress and the courts have refused to confine permissible principles of procedure to a narrow corridor; by granting the Commission flexibility, they implicitly recognized the wisdom of the Justice's words.[1]

By these distinct considerations, the purpose and the method of price regulation is presented in its proper perspective, and they should dictate the results required. Where a compulsory service obligation exists the only regulatory problem is to appraise a service that must, of legal necessity, be rendered. Where the output is direct and constant, the value of the service thus performed, in terms of the allowed rate, can legitimately be referenced to a reasonable yield on the actual costs involved. In the absence of this obligation, however, the role of appraising the services performed assumes a decidedly different function: the problem becomes that of fixing a price based, not only upon what must be performed, but primarily upon what will induce the product. The regulatory emphasis shifts. It is not so much actual cost as it is market cost;

[1] See, *e.g.*, *Wisconsin* v. *F.P.C.*, 373 U.S. 294 (1963); *Colorado Interstate Gas Co.* v. *F.P.C.*, 324 U.S. 58 (1945); *F.P.C.* v. *Natural Gas Pipeline Co.*, 315 U.S. 575 (1942); *Bel Oil Corp.* v. *F.P.C.*, 255 F. 2d 548 (5th Cir. 1958); *Forest Oil Corp.* v. *F.P.C.*, 263 F. 2d 622 (5th Cir. 1959).

not only prudent return but incentive prices; not just cost of service but also cost of supply. These multifarious considerations are so well established that there should be no need for further discussion. They were made explicit in our decision to focus on area rate-making and have been consistently reaffirmed. *Phillips Petroleum Company*, 24 FPC 537, 542–548 (1960); aff'd, 373 U.S. 294, 308–310 (1963). That decision compels thorough consideration of the factors that determine a reasonable market price.

It has been argued that *en masse* cost proceedings contain an inherent incentive for low cost producers since their profits are limited only by ceilings premised on much higher costs. Group cost proceedings may offer more incentives than individual proceedings, but if the history of pipeline production and its regulation by this Commission on an individual cost basis is any indication, cost regulation as a general principle in utility regulation does not provide the necessary system. By such control, there has been a 25 per cent decrease in the ratio of actual pipeline production over a six-year period: in 1957, pipeline production was 11.69 per cent of purchases; in 1958, 10.56 per cent; in 1959, 10.87 per cent; in 1960, 10.38 per cent; in 1961, down to 9.57 per cent; and in 1962, only 8.78 per cent. See *Sales by Producers of Natural Gas to Natural Gas Pipeline Companies* (F.P.C., 1963). These statistics are for individual companies as composited on an annual basis.

It has also been argued that, if total industry costs plus a reasonable return are recovered, then gas will continue to be found. Total costs are not recovered under group cost regulation; the higher cost producers, which must be considered in any statistical compilation, will still not be made whole. Moreover, gas is found by the individual decisions and acts of thousands of producers. To them, incentives must relate to profits available in other sectors of the economy. If the maximum price any one producer can obtain from his production is insufficient, as he might determine *vis-a-vis* his own interests and alternative investments, it is of little concern to him that the ceiling was premised on the larger percentage of the industry's costs. So long as there is a reasonable likelihood that his prices will be reduced below his contract terms or his certificate conditions, he will not have the necessary incentive to commit funds for further exploration.

I emphasize, in full agreement with our opinion, that the area rates we are to determine have a single, overriding purpose: to control the available supply of natural gas; and those rates have but one utilitarian function: to be high enough, but only high enough, to accomplish this policy function. In the context of area pricing, just and reasonable rates can best be used as a measure to elicit the necessary supply. So viewed, price control is the overriding policy. The function should be accomplished, and the standard should be employed, in the most direct and least dilatory manner possible.

REGULATION BASED SOLELY ON COSTS

The Commission places primary reliance for its answer in this initial case upon cost-plus regulation. This accepted formulation is little more than individual cost of service applied on an area basis to an averaging of composite costs. In making this determination, we must grapple with Gordian problems that do not readily accommodate to precise disentanglement; for our purposes here, cost analysis defies mathematical logic. Nevertheless, the focus in this proceeding on such costs make it both necessary and proper that we determine the financial requirements of the industry.

Costs as a Basis for Comparison

The major emphasis in the Commission opinion on cost-plus regulation appears to stem from a conviction that costs *must always* be the primary basis for regulation. I believe we have more flexibility, particularly for future proceedings, than is suggested there. The leading authority on this issue is *F.P.C.* v. *Hope Natural Gas Company*, 315 U.S. 575, where the Supreme Court declared:

> It is not the theory but the impact of the rate order which counts. If the total effect of the rate order cannot be said to be unjust or unreasonable, judicial inquiry * * * is at an end. The fact that the method employed to reach that result may contain infirmities is not then important.

The tenor of the above quotation supports the general proposition that regulatory agencies are to be accorded a strong presumption of validity in determinations that must be based largely on commission expertise. Certainly producer regulation qualifies as a subject matter in which there should be large scope for Commission innovation and adaptation to the economic facts of life in the industry. The Commission opinion, in my view, charts too narrow a course for the future. Cases such as *City of Detroit* v. *F.P.C.*, 230 F. 2d 810 (1956), where the D.C. Circuit Court reversed a Commission determination which would have allowed a pipeline the field price for its purchases of natural gas from an affiliated producer, do not bind us to costs alone. The Commission had there sought to avoid the complicated and time-consuming "rate-base" method, which is presently relied upon for the flowing gas price albeit on an area basis. The circuit court reversed, holding that the purposes of the Natural Gas Act require that costs be considered; however, the opinion emphasized that this was to be regarded as no more than a starting point. Thus, the Court there stated:

> * * * though we hold that method [the rate base or cost of service method] not to be the only one available under the statute, it is essential in such a case as this, that it be used as a basis of comparison. It has been repeatedly used by the Commission, and repeatedly approved by the courts, as a means of arriving at lawful—"just and reasonable" rates under the Act. Unless it is continued to be used at least as a point of departure, the whole experience under the Act is discarded and no anchor, as it were, is available by which to hold the terms "just and reasonable" to some recognizable meaning.

The above language was relied upon by the Fifth Circuit in another proceeding, *Bel Oil Corporation* v. *F.P.C.*, 255 F. 2d 548 (1958), where that court was faced with an allegation by certain producers that the Commission should base just and reasonable rates on field prices. The court rejected this contention, saying:

> We cannot agree [to] the proposition that the evidence thus far adduced makes out a *prima facie* case of reasonableness of the contract price of 16 cents. We do not hold that the evidence of field price is irrelevant. We do hold that evidence of unregulated prices in the field is not sufficient to warrant a finding by the Commission that a price comparable to them is just and reasonable within the intendment of the Natural Gas Act, *Id.*, at 553.

The Court further observed:

> The regulation of the prices at which thousands of "natural gas companies" may sell to the pipeline companies is a difficult one at best. It is a field which in many respects requires new formulas to test what is just and reasonable.

Rebutted in efforts to rely solely on contract prices, the Commission commenced the seemingly interminable task of determining just and reasonable rates to be allowed on an individual company cost of service basis for the country's major producers of natural gas. Realizing the futility of the individual cost approach, the Commission made the necessary determination that area rates be utilized. Significantly, the decision marked a step away from the individual company costs; the emphasis shifted to other economic indicia. New formulae for public utility regulation were necessary. It became possible under area pricing that some producers might not be able to operate under ceilings; it also raised the possibility that many producers would receive high rates of return simply because of the success of their operations. The departure signalled the demise of cost-plus regulation for natural gas producers. Recognition was accorded the fundamental difference that exists between the producer of a commodity and the seller of a service. The latter is readily amenable to utility regulation; the former clearly is not. Significantly, the same court that decided *City of Detroit* affirmed the departure from costs in the *Second Phillips* litigation. In 303 F. 2d 308 (D.C. Cir. 1961) Chief Judge Prettyman, author of *City of Detroit*, declared:

> * * * But what of a fair price for a commodity bought and sold by a merchandiser? Almost the whole of the economics of merchandising differs from the economics of public utility service. Are the just and reasonable prices of such a merchandiser limited to fair returns on his own investment and prices paid by him (and, if so, what investment and what prices), or are those prices reasonably measured by the fair prices for the product as measured by the open competitive market for the product, evaluated by Commission expertise and data on the whole of the market operation? Either criterion is a method of regulation. It seems to us that the choice must lie with the Commission. *Id.*, at 388.

In turn, the Supreme Court affirmed the area approach, 373 U.S. 294 (1963). Significantly, it there declared:

> We recognize the unusual difficulties inherent in regulating the price of a commodity such as natural gas. We respect the Commission's considered judgment, backed by sound and persuasive reasoning, that the individual company cost-of-service method is not a feasible or suitable one for regulating the rates of independent producers. We share the Commission's hopes that the area approach may prove to be the ultimate solution. *Id.*, at 310.

Although repeating assurances at oral argument that "composite cost-of-service data" would be considered, the Court went on to say that *City of Detroit*, insofar as it required cost regulation, is to be distinguished from area pricing because the circuit court did not have before it any questions relating to the area rate method. This precedent leads inexorably to the conclusion that, even though some consideration of costs may be required for an initial area pricing formula, the cost approach need not, in circumstances of workable competition, be the governing methodology. Nevertheless, five years after the area approach was initiated in *Second Phillips*, and over twenty years after the Court observed that "he who would upset the rate order under the [Natural Gas] Act carries the heavy burden of making a convincing showing that it is invalid because it is unjust and unreasonable in its consequences." * * * *F.P.C.* v. *Hope Natural Gas Co.*, 320 U.S. 591, at 601 (1944), this Commission retains its attachment to cost-plus. In the light of compelling authority, it must be concluded that fears of judicial review need not be entertained to preclude Commission departure

from strict adherence to cost-plus. In this proceeding there has been an extensive investigation into the operations of producers, with all parties having received a thorough opportunity to present their separate views and to review the evidence presented by others. Beyond a doubt, with due consideration being accorded the many difficulties inherent in any cost analysis of a joint product, it is clear that the prices adopted today bear a close and substantial relation to the weighted average prices negotiated in the field. The cost-plus rate and the negotiated contract rate fall within that zone of reasonableness that is essential to regulation. Therefore, it is not required in future proceedings that costs be the beginning and the end of just and reasonable rates. The time is ripe to abandon costs as the sole referential. Among the alternatives, competition has been shown to be sufficient to provide an appropriate and compelling measure of just and reasonable rates.

Inherent Limitations in Cost-plus Regulation

Cost-plus regulation alone is not an objective, independent determinant for just and reasonable prices for producers. Any determination upon evidence of costs will necessarily depend on numerous pragmatic adjustments that will, without consideration in detail of other relevant factors, permit a certain amount of variation that could otherwise be controlled. It is no difficult matter to appreciate the problem. Staff concedes that "costing for producers of gas is not, and likely never will become, as precise as is customary in utility regulation." The major inherent difficulties are fourfold.

Fundamentally, the factual and statistical presentations relied upon in the main opinion are but estimates. There are immense difficulties in the collection, selection, and presentation of data. Voluminous questionnaires are issued, but many go unreturned. Staff Appendix data in the largest of the five size categories is based on 93.8 per cent of the producers. In the next largest group only 30.9 per cent are available. The percentages are dropped drastically to 8.0 per cent in the third group, to 2.7 per cent in the fourth, and to but 0.8 per cent in the smallest. Although the excellent response in the largest category does provide good area cost coverage, there is a notable exception by the absence of crucial exploratory drilling costs. Specifically, unrecorded dry holes are of necessity incomplete. Any meaningful anticipation of probable accuracy is weakened by an absence of fully reliable statistical verity. Perhaps these deficiencies could be cured in the future, but the precipitous decrease for available questionnaire data on the small producer groups presents more fundamental problems, particularly since the small producers drill the greater proportion of exploratory wells. The smaller producers operate on extremely limited resources and are thus less likely to maintain books that would be adequate to provide meaningful replies. While 67 of 68 Appendix B questionnaire responses for the second largest group are acceptable for compositing purposes, 46 of the 105 Appendix C responses were inconsistent or incomplete to the extent that their data was entirely excluded. Consequently, as sales and production volumes decrease data credibility likewise decreases. Exhibit 255, among others, indicates there is an exact inverse relationship between sales volumes and per unit costs; as the former decrease, the latter increase. This statistical inaccuracy means that primary reliance on questionnaire data places the small producer—the one most likely to be undercut through *en masse* normative costing—in a triple squeeze: due to the high cost of compilation, a low percentage can submit cost data; a high percentage of the data submitted must thus be rejected; and such responses as finally filter into a composite exhibit must be discredited for low coverage on a voluntary basis.

Despite these inherent deficiencies, the issuance of the questionnaires is not inutile. To the contrary, their submission has been of notable assistance in arriving at rates which are just and reasonable, and in establishing, as evidenced in our opinion, that negotiated field prices are within the permissible zone of reasonableness, even from a cost perspective.

Of necessity, the Commission had to supplement questionnaire data by amplifying the information available from various published sources. Although this reinforces some aspects of data reliability, other problems arise in proportion. The separate publications are usually limited to the very large operators, and are thus even more restricted than under the questionnaire responses. Coverage of these outside sources is usually national and international, so that expenditures are presented in broad categories that portray many meaningful items in single dollar total; consequently, specific cost items that should require special regulatory treatment cannot be separately identified for the Commission's purposes. As various sources are necessarily utilized, approximation of these unknown components is effectively prevented by the obscure or overlapping categorizations used by each source. Statistical probability thus declines and, although such cost analysis provides a "zone of reasonableness" within which the required pragmatic adjustments can properly be made, there is no precise objective standard for the purposes of the industry.

After the cost components are adopted, the circular ceremony known as cost allocation begins. We have avoided some of the pitfalls, but our reliance on even the semblance of allocation requires that we exercise our judgment within a fairly broad range of rates. By definition, allocations occur because certain costs cannot be directly identified with certain functions of the various identifiable products or assets, and allocated costs thus present a distinct existence apart from directly ascertainable costs. Where the ratio to total industry costs is small, the gaps are insignificant; however, as the ratio increases, both the costs and the resulting rates, to the extent directly transferred, become less reliable and more subject to adjustment. As the speculative base becomes more pronounced, the choice of allocation formulae can produce a wider range of rates, but the logical relationship between any resulting rate and the current costs of supply becomes even more remote. Although the courts may have declared that "It is not the theory but the impact of the rate order which counts," I do not believe that merely because the results reached today are reasonable and have a valid reference to the prevailing market price at the wellhead that cost-plus should be employed in the future as the sole referential. The imprecise determinations can only be a transcendent command unduly complicating later proceedings, and the analytic principles evoked can have but the validity of a foregone conclusion.

The difficulties involved in allocations are not hard to appreciate. The allocations problem confronted by the Commission is that of attributing legitimate, but separate, costs to a largely joint product. According to witness Sherwin, the costs attributable to associated gas are 100 per cent joint, as that term is technically employed, and, for non-associated gas, 31 per cent joint and 24 per cent shades of joint and common. Thus, even for non-associated gas, only 45 per cent of the costs are directly attributable to the product committed to our jurisdiction. The Commission has previously stated the implications of this:

> While we must make allocations in all rate cases, the amounts involved in electric and gas pipeline cases have been comparatively small, and the allocations relatively simple. In the case of a producer, the amounts involved in the allocations of costs are major in size and extremely difficult to make. The result is that a producer actually could become bankrupt, or could

> make enormous profits, depending merely upon the methods of allocation used. 24 FPC at 543–544.

Strict adherence to allocation formulae would produce a spectrum of rates so wide and variant as to lend a sophist's support for the extremes, and as a practical matter to be capable of producing clearly unrealistic results. In such a case, as well as in the case of prescribed rates that come to rest somewhere between the extremes, the supposedly independent determination of legitimate costs is actually based upon pragmatic adjustments of either the formulae employed or, in a guise of expertise and trending, of the deceptively precise mathematical resultants. This certainly is no well-guarded secret:

> When an unrealistic result is reached, the formulae for allocations must be changed, in order to bring about a reasonable result. The allocation methods then become a means of supporting a result already arrived at, rather than a means of arriving at a result which was previously unknown. *Id.*, at 544.

Finally, even after statistical costs are collected, compiled, selected, allocated, and invariably trended and modified, they must still be related to reserve additions before the desired costs per Mcf can be found. An understatement of reserves found causes high per unit costs, and thus results in high rates. An overstatement has the reverse results. Despite the confidentiality attached by producers to their reserve figures, the industry's cooperation in this proceeding prompted them to submit a composite exhibit of estimated reserves for the Permian Basin. In addition, there are numerous published sources for reserves estimates. Nevertheless, such figures are no more than estimates, and their estimation entails a considerable degree of subjectivity. This is revealed on the record before the Commission as was similarly disclosed in the investigation into Phillips' individual costs. See 24 FPC at 544.

The statutory function of rate regulation is to arrive at reasonable results, and no criticism can be levelled at the attempt to stay within a zone of reasonableness. The use of composite figures to explain economic behavior is clearly a most useful analytic system; however, reliance on allocations, estimates, and other variations of expertise are not the only independent referentials that are desired or that can be utilized.

To the extent that cost analysis is productive of reasonable results, and with one exception our opinion today meets this judicial standard, it would be most helpful for our regulatory purposes if ascertainment of a producer's investment were to be presented on a basis conforming to sound accounting practices. The derivation of a return allowance is a three-step computation: first, ascertainment of the investment; second, determination of the period of time over which the investment is to be allowed a return; and, third, ascertainment of the rate of return. I concur in the Commission's determination on this issue because, on the record in this case, no other disposition is feasible. However, it appears that the yield concept deserves full consideration in future proceedings as a reasonable alternative that might be preferable to traditional methods.

In a 1963 publication by Arthur Anderson & Company, entitled *Accounting for Oil and Gas Exploration Costs*, it is concluded that the present practice of the industry of expensing exploration and development costs as incurred is in discord with the accounting and economic principles. Written for the limited purpose of discussion and study, the publication recommends that leasing, acquisition, carrying, drilling, geological, and other such costs, as well as general and administrative costs related to exploration and overhead, be capitalized and later amortized on an overall unit-of-production basis as production occurs. It states. "[s]uch aggregate costs include nonproductive exploration costs which,

in our opinion, are capital in nature," and later, "[t]hey should be capitalized since they are just as much a part of the cost of the reserves found as are the lease and well equipment on the producing wells." The pamphlet recognizes, however, that "* * * appropriate recognition should be given to such current reductions in income taxes as may result from the current deduction of such capitalized costs for income taxes as incurred. This is essential to a proper determination of costs."

The recommendation in the pamphlet may also be sound for regulatory purposes. At least, as recommended by Staff witness Spain, that portion of it which advocates full cost accounting for all finding expenditures should be thoroughly explored. Any lesser treatment is a refusal to recognize the full cost of acquiring productive assets. Such cost accounting has been undertaken on a very limited basis by the industry, and it appears that the results have provided more accurate knowledge of the functioning of the industry and of the results of expenditures. Without going into detail at the present, I believe the true yield method may be shown not to change the rates here established. In any event, it is not possible to utilize this control for our decision today: the record is not adequate, the various recommended returns are not directly transferable, and the industry has not generally accepted the principles involved.

AN APPROPRIATE BASIS FOR DECISION

These limitations inherent in cost-plus producer regulation do not, however, spring only from the allocations and adjustments, nor only from the inherent difficulties of data collection, selection, and compilation, nor only from the resulting deficiencies in the construction of a legitimate costing model, nor only through deemphasis of available reserves estimates. I believe the facts in this case reveal that in the future the Commission need not be confined to cost-plus regulation. The accusation of "drastic inflationary cycles" in wellhead prices in the last twenty years stands rebutted. As a matter of general principle, it is not sound to argue that cost-plus regulation cannot be supplemented because the rise in wellhead prices, experienced in the recent past, was due to producer-dictation of contract prices; that those prices were grossly in excess of cost trends; further, that the wellhead price increase was directly reflected in burner tip increases, albeit four-fold that at the wellhead; and, finally, that any attempt to consider factors in addition to cost-plus regulation would constitute an abdication of responsibility, and would result only in another round of similar, allegedly violent, price jumps.

The propriety of the price rise since 1945

Any detailed discussion of the accusation of price-dictation by producers will not be undertaken here;[2] however, long experience with the industry is convincing that, where price dictation exists, it is seldom with the seller. All available information and discussion lead persuasively to the conclusion that field prices are set after vigorous bargaining within a context of numerous restrictive economic forces. More particularly, in the Permian, there has been an essentially monopsonistic environment whereby the transmission company in a particular field would set, on a unilateral basis, the fixed, maximum rate for natural gas in the area. Accomplishing this unilateral price-dictation is particularly

[2] The problems are well-documented in numerous professional journals and academic surveys. Reference is made particularly to MacAvoy's *Price Formulation in Natural Gas Fields*, (Yale University Press, 1962); Neuner's *The Natural Gas Industry; Monopoly and Competition in Field Markets*, (University of Oklahoma Press, 1960); and Cookenboo's *Competition in the Field Market for Natural Gas*. (The Rice Institute Pamphlet, 1958).

possible for a company free of economic constraint. This was the situation for El Paso Natural Gas Company. El Paso not only purchases over 70 per cent of the interstate Permian gas, but it also produces over 15 per cent of its total volumetric purchases. In this connection it should be noted, as was established by the record in *United Gas Pipe Line Company*, Docket No. RP63–1, 31 FPC at 55 (1964), wellhead prices are uniformly depressed in areas where pipeline production is prevalent. Nevertheless, many have argued that, if transmission companies had possessed any bargaining leverage, the recent rise in gas prices *could not have occurred*. This argument must be rebutted.

It is clear that the wellhead price increases of the 1950's began at levels not even remotely approximate to the cost or value of separately found reserves. No responsible authority disputes this position. As late as 1960, this Commission is on record that:

> * * * rigid adherence to the rate base method will, in many cases, price the producers' gas completely out of market. This fact is now abundantly clear: Regardless of variations in allocations methods, allowance for incentives, and other disputed factors, computations of the cost of natural gas which have been presented in the many cases before us show that natural gas has been, in most instances, substantially underpriced. 24 FPC at 547.

When the Supreme Court ordered Commission jurisdiction over natural gas producers, gas was not paying its own way in the industry. The problem came to the forefront in 1948 when the Commission's *Natural Gas Investigation* established that gas was being wasted in enormous volumes, that it nevertheless had excellent value as a fuel, and that the most effective practice would be to establish a minimum price on sales of gas to pipelines in order to conserve the resource. It is paradoxical that, four years prior to its *First Phillips* decision, the Supreme Court should approve state-imposed minimum wellhead prices for natural gas to the end that it would not be wasted. See *Cities Service Gas Co.* v. *Peerless Oil and Gas Co.*, 340 U.S. 179 (1950). This disparity between costs and past prices is indicated by our opinion today.[3] If the analysis we utilize for new gas is applied to the average wellhead price for natural gas in 1947, the difference between the two is at least 2.4¢, with the average contract price being *below* the cost-plus figure. In 1947 gas sold at an average price of 6.0¢, but the Commission's present approach, if applied then, would have resulted in a price of 8.4¢. It was not until the late 1950's, according to the costs established today, that natural gas prices came to approximate the cost-plus rationale utilized by our opinion. Thus, the price rise of the 1950's resulted primarily from the gradual maturation of the natural gas industry into one where the product sold was paying a just return to the independent producer. Particularly anomalous, in view of allegations of "continuing inflation" of natural gas prices, is the fact that such an increased allowance to provide a return on investment and expenses is the least that should be accorded the producer as a result of his elevation to a "natural gas company" under the Act.

In addition to natural gas coming into its own, there were, in the main, four factors that led to increases. *First*, the sudden rise in interstate demand necessitated, because of our regulatory standards, an equally sudden increase in reserve capacity with a concomitant market allocation to the higher usage. *Second*, the resultant of such demand was an activation of favored nation and spiral escalation clauses. *Third*, there was an extensive renegotiation of escalation clauses by pipelines in order to preclude such a repetition. *Fourth*, a

[3] It is not possible to relate our present cost analysis in precise manner to past prices, primarily because of the absence of questionnaire data. Nevertheless, industry-wide statistics provide a meaningful basis for comparison.

competitive buyer's market existed temporarily when transmission companies entered new purchasing areas to negotiate contracts at prices somewhat above then extant market values. It is of special significance that wellhead increases occurred in the latter instance, particularly in the Permian Basin in the late 1950's for it indicates that, without a competitive purchasing structure, producers are not able to achieve the higher prices. Thus, taking the average wellhead prices for the Permian in 1947 and 1956, the prices were 4.0¢ and 9.7¢ respectively, which are prices significantly less than the costs that have been established by this proceeding. By the rationale today utilized, this Commission could have established maximum prices of 7.2¢ and 12.5¢ in those two years, and the difference between the costs and what El Paso was then dictating amounts to prices some 30 percent *below* the new gas ceiling that would have then been required.

Furthermore, it must be emphasized that there is absolutely no support, apart from a so-called "anarchic inflation" allegation discussed hereinafter, that transmission companies, even though they possess superior bargaining leverage, are, because of an alleged ability to shift the costs without concern, indifferent to using this leverage. This accusation has been clearly refuted, not only by the published authorities cited earlier, but by the record before us. Witness Mayer, who has participated for over thirty-five years in the negotiation of sales contracts for Phillips Petroleum Company which is the largest independent producer of natural gas in the United States, and has been a supervisor in the sales division since 1945, testified as follows:[4]

> Q: Turning first to matters of general rebuttal, I direct your attention to the question of the Examiner occurring during cross-examination of Mr. Frazier at Tr. 231/27,003, lines 1–4, concerning the degree of bargaining between pipelines and producers existing in the past and present in the Permian Basin and ask you to state what your experience has been in this regard.
>
> A: I have been intimately involved in negotiations with the pipeline companies in the Permian Basin for nearly twenty years. *I have yet to see the time that the negotiator for the pipeline didn't drive as hard a bargain as he possibly could.* In my opinion, the pipelines have negotiated, and will continue to negotiate, for the purchase of gas in every way which will result in the greatest benefit to themselves and their customers.

This experience of the industry cannot, as a matter of record, be disputed. Significantly, the Examiner, although not fully persuaded on this matter for the entire period of the 1950's, was able to conclude as follows:

> * * * There is presently intense competition between pipelines for the limited growth in city-gate demand. And now that the city-gate price has advanced materially and distributors' costs have increased, competitive price pressures in the ultimates market have resulted in an added cost consciousness on the part of pipelines.

Since we are here fixing rates for the future, the circumstances with which we should be most concerned are reflected in the above conclusion.

Reliance need not be placed solely on the above. It is more significant that the rise in the price of natural gas can be fully explained, and that this rise has been part of a long-term picture that cannot be overlooked if there is to be a dispassionate analysis of the price-rise argument. The Bureau of Mines has compiled data in its *Minerals Yearbook* into charts that begin with 1940 or 1945. Such data have been used to emphasize the price rise. This limited survey

---

[4] Tr., pp. 28, 138–139.

is misleading because it overlooks the experience of wellhead prices over a twenty-year period prior thereto:[5]

Year	Price (cents per Mcf)	Year	Price (cents per Mcf)	Year	Price (cents per Mcf)
1922	11.1	1935	5.8	1948	6.5
1923	10.0	1936	5.5	1949	6.3
1924	9.3	1937	5.1	1950	6.5
1925	9.4	1938	4.9	1951	7.3
1926	9.5	1939	4.9	1952	7.8
1927	8.8	1940	4.5	1953	9.2
1928	8.9	1941	4.9	1954	10.1
1929	8.2	1942	5.1	1955	10.4
1930	7.6	1943	5.2	1956	10.8
1931	7.0	1944	5.1	1957	11.3
1932	6.4	1945	4.9	1958	11.9
1933	6.2	1946	5.3	1959	12.9
1934	6.0	1947	6.0	1960	14.0

This complete presentation reflects the full scope of the price history of natural gas production: a germinal period of relatively high prices followed by successively declining periods which resulted in depressed prices that were extremely low; the low point was reached during wartime when price controls were imposed based on market conditions; and finally, there was a period of successive increases during the post-war period responsive to the increased demand. Significantly, these statistics establish that the moving average price in 1954, when federal producer regulation was imposed, was 1.0¢ lower than that of 1922, and the oft-emphasized increase from 1950 to 1960 was but 0.9¢ greater than the seldom emphasized decrease from 1922–1940.

Even the increase from 1945–1960 must be placed in further perspective. Based on *Minerals Yearbook* statistics, the record exhibits reveal the explosive volumetric growth experienced by natural gas sales over the relevant period: in 1935, 1.92 trillion cubic feet; in 1940, 2.66 trillion cubic feet; in 1945, 3.92 trillion cubic feet; in 1950, 6.28 trillion cubic feet; in 1955, 9.41 trillion cubic feet; and, in 1963, 13.88 trillion cubic feet. During this period demand increased over 700 per cent. This growth, when considered with the circumstances that production rates of return on average total capitalization have declined steadily since 1951,[6] and that several large supply areas have developed from what were once considered doubtful prospects, conclusively establish that there is no substance to the proposition that extravagant producer returns resulted in unnecessary exploratory drilling activity during the relevant period. The activity of natural gas production is simply not susceptible to the same precision of cost-control that is possible in most manufacturing and retail operations. Ultimately, unproductive outlays will always be the price of flowing gas, just as flowing gas will always be the product of once doubtful expenditures.

Reflecting a remarkable demand explosion, the high desirability of natural gas as an energy source doubled its relative position in the energy fuels market. Gas supplied but 14.1 per cent of this market in 1946. This increased to 17.6 per cent in 1949, to 20.5 per cent in 1951, to 24.5 per cent in 1954, to 27.6 per cent in 1958, and to 29.4 per cent in 1960. While the 1946–1960 rate of growth for

[5] Record Exhibit No. 25, Schedule 2. See also Bureau of the Census, *Historical Statistics of the United States* (1960) and subsequent supplements.

[6] Respondent's Exhibit No. 220, Schedule 11.

coal-lignite and liquid petroleum was a sluggish 2.4 and 4.7 per cent, respectively, natural gas experienced the rapid growth rate of 8.4 per cent.

The effect of this increasing demand on wellhead prices has been thus explained:[7]

> The sharp increase in field prices over the space of a year or so is undoubtedly responsible for much of the political support of price regulation for the industry. Such a rapid rise in prices is, of course, quite possibly compatible with the operation of a competitive market where consumption increases rapidly and where a part of the increase is in higher value uses, as has been shown to be the case in this industry. Total marketed production averaged 5.1 trillion cubic feet per year for the country as a whole in the period 1946–1950, compared with 8.8 trillion from 1953–1955, an increase of about 75 per cent, compared with the 86 and 93 per cent increases in price in [Texas Railroad District Number 4 and South Louisiana]. The relative price increases are not appreciably greater than the relative increase in consumption for the nation as a whole; and in these two areas marketed production was probably up more than the national total.

The increasing demand for interstate gas dictated that annual additions not only equal production, but that a reserve cushion also be added as a safety margin. As annual consumption increased, annual findings had to increase at a greater rate. Prices had to rise, not only to meet rising costs, but also to finance the annual increase in capacity. In other words, prices had to more than recompense the previous investment in order to provide more than current production. The result was the classic reaction of a free market: prices rose, not only to increase capacity in response to demand, but also to limit that demand until deliverability had accelerated.

The price rise has had, and continues to have, two other highly desirable effects upon the disposition of natural gas: it curbed waste, and it deflected gas away from such inferior uses as carbon black production. The record portrays this quite distinct inverse relationship between price and waste:

Year	Average wellhead price seven Southwestern States (cents per Mcf) constant (1947–49) purchasing power	Wasted and vented seven Southwestern States percent of net production
1946	4.1	24.7
1947	3.9	22.7
1948	4.3	15.7
1949	4.5	15.1
1950	4.7	12.2
1951	4.8	10.2
1952	5.6	10.0
1953	6.7	9.1
1954	7.4	7.7
1955	7.6	7.5
1956	7.7	7.6
1957	8.0	6.8
1958	8.7	5.1
1959	9.4	4.4
1960	10.1	4.2

The Bureau of Mines *Minerals Yearbooks* reveal the identical inverse relationship between price and less desirable uses:

[7] Cookenboo, *op. cit.*, p. 39.

Consumption sources	1940	1945	1950	1955	1963
Residential	16.7	15.6	19.9	23.4	24.5
Commercial	5.1	5.9	6.4	6.4	8.7
Total	21.8	21.5	26.3	30.3	33.2
Oil Field	26.8	23.5	19.7	16.7	14.2
Carbon Black	13.9	11.0	6.8	2.7	.8
Refineries	4.8	8.7	7.6	6.9	5.4
Electric Utilities	6.9	8.4	10.4	12.7	14.6
Other Industrial	25.8	20.9	29.2	30.7	31.8
Total Industrial	78.2	78.5	73.7	69.6	66.8

In evaluating the advisability of placing primary reliance on field-negotiated prices, it is necessary to appreciate that the increase in wellhead prices was but a slight portion of the increase in burner tip prices, and that neither increase was inconsistent with contemporaneous trends. Witness Jordan's exhibit reflects the following relationship between wellhead and burner tip price increases:[8]

Year	Wellhead prices	Average value residential use	Wellhead price as a percent of residential value
1950	6.5	69.0	9.4
1951	7.3	76.0	9.6
1952	7.8	83.1	9.4
1953	9.2	86.5	10.6
1954	10.1	89.3	11.3
1955	10.4	88.7	11.7
1956	10.8	91.3	11.8
1957	11.3	93.0	12.2
1958	11.9	98.2	12.1
1959	12.9	101.1	12.8
1960	14.0	103.4	13.5
INCREASE			
1950–55	3.9	19.7	19.8
1955–60	3.6	14.7	24.5
1950–60	7.5	34.4	21.8

The above clearly establishes that, while the years 1950–1955 saw a 3.9 cent increase in wellhead prices, they also saw a 19.7 cent increase in residential prices. The years 1955–1960 show a similar relationship: a 3.6 cent increase in wellhead prices and a 14.7 cent increase in residential prices. For the entire period, the relationship was 7.5 cents to 34.4 cents, revealing that residential price increases were the result not of wellhead price increases, but, among other things, of increases in the capital costs and expenses of transportation and distribution. The following nationwide figures are important:[9]

Disposition of consumer prices

Average overall prices	1954	1957	1960	Percent
Prices (per Mcf):				
Wellhead value	0.10	0.11	0.14	
Value at point of consumption	.38	.43	.50	
Functional shares (per Mcf):				
Production	.10	.11	.14	28
Other	.28	.32	.36	72
Total	.38	.43	.50	100

[8] Respondent's Exhibit No. 42.
[9] Respondent's Exhibit No. 32, Table 14.

Changes in consumer prices

Functional shares (per Mcf)	1954 to 1957	1954 to 1960
Production	+0.01	+0.04
Other	+.04	+.08
Total	+.05	+.12

These charts are persuasive indicators that producers have not been the cause of "anarchic inflation". To the contrary, the legitimate costs of producing and delivering natural gas have necessarily resulted in price increases which must be borne to the end that a sufficient and assured quantity of gas is available for ultimate users throughout the Nation. Significantly, our opinion today establishes that costs have risen to rates that are no more than is required to provide natural gas service.

The price indices at production and consumption points for various fuels, and a comparison of production point fuel price increases to general indices is conclusive in the cumulative statistical presentation. The record reveals the following:[10]

Comparative weighted average prices of mineral fuels at points of production in cents per million Btu

United States

Year	Natural gas	Crude oil	Bituminous coal	Pennsylvania anthracite
1945	4.6	21.0	11.7	23.2

[10] Respondent's Exhibit No. 25, Schedule 15.

These data reflect what has been too-lightly disregarded: that the rise in natural gas prices was not excessive in relation to the rise in interstate demand, the rise in wholesale price trends, the rise in price trends for competitive fuels, or the rise in average hourly earnings. They also reveal that criticism cast on the producer for residential price increases was 80 per cent misplaced, and accusations of extraordinary production returns were statistically unsupported. This overall picture is made clear by the chart on page 260. Rather than constituting a justification for rigid cost-plus regulation, the criticism is refuted by the extensive investigation and cross-examination that has occurred in this case. It must be concluded that natural gas has been earning no more than a fair return on its costs, and the absence of conclusive evidence to the contrary bolsters the presumption that the competitive factor in the field provides, within limitations, the necessary independent determinant to this Commission's regulatory responsibilities.

The absence of producer price-dictation in the Permian Basin

The early necessity for conservation laws in most states was a result of the ruinous competition that was possible in producing fields because of the law of capture. This era of active rivalry among producers is now past, but the opportunity for independent operation which led to state conservation regulation indicates the sense of independence that is common among the operators of producing properties. It is indeed fortunate that these early predatory practices have been eliminated. Furthermore, the prevention of drainage to protect correlative rights and the regulation of production to reflect market demand has not eliminated competition in other aspects of the companies' activities. The primary basis that leads to any presumption of a lack of competition has been the price rise. As discussed earlier, this has been no more than a reasonable rise responsive to high costs, and it was considerably less marked than the increases which resulted in other commodity-oriented industries.

Aside from the overwhelming concentration on costs by Staff and the California distributors, thorough consideration of the competition issue has been clouded in a failure to make precise definitions. The problems of description and categorization result from the various meanings attached to the concept of competition. In my view competition means a buyer is free to purchase alternative sources of a product from relatively small sellers acting independently of each other.

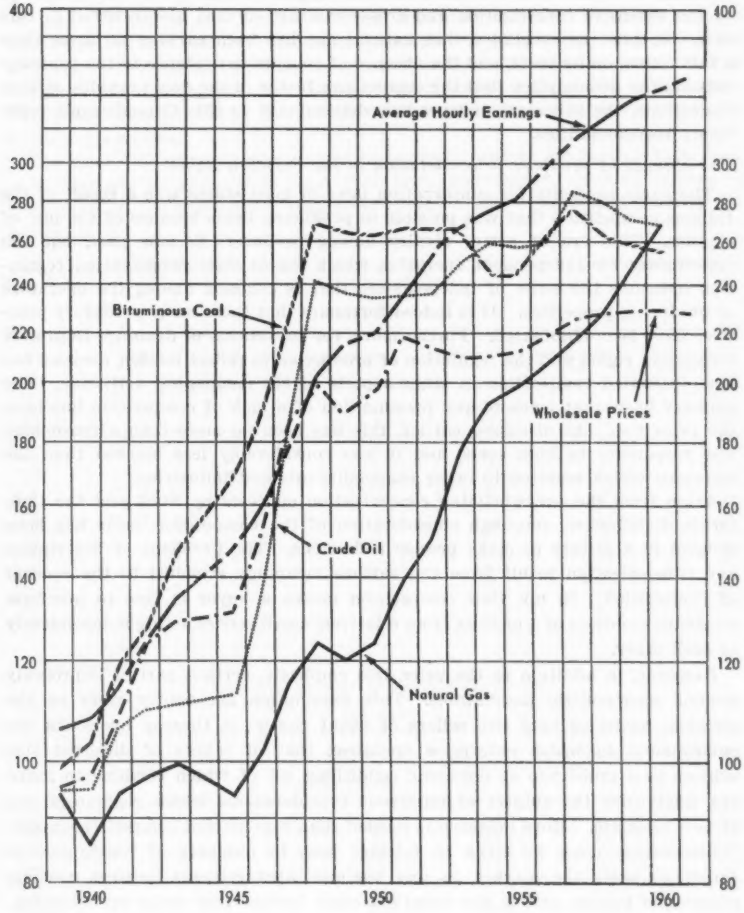
However, in addition to the price rise emphasis, certain parties improperly assume monopolistic motivations. This assumption necessarily rests on the classical model of only two sellers of equal power; it thereby overlooks the environment in which enterprise operates: that of sellers of different size subject to a multitude of economic conditions, all of which combine to make any final price the subject of numerous considerations which regulators can at best estimate. More evidence is needed than a restricted competitive model. Consideration must be given to relative size, to numbers of companies, to ability to enter the market, to any business arrangements between various sellers and buyers, and to the countless other factors that make up a market. Of particular significance to the producing industry are such special market conditions as acreage controls, flaring rules, and the prevention of lapse of the lease. The question is one of the power of a seller or group of sellers to dictate a price that is divorced from costs. This condition does not exist in the Permian Basin. It is clear that there is such a measure of effective competition that in future proceedings producers can be accorded a relative degree of independence to the end that contract prices determine the ceiling price we set for natural gas.

COMPARATIVE TRENDS OF AVERAGE PRICES OF MINERAL FUELS AT POINTS OF PRODUCTION

United States

1939-1961

INDEX NUMBERS 1935-1939 = 100



On the record before us, there is no evidence of monopolistic power possessed by producers in the Permian Basin. The issue, though properly raised by the producers, has gone unnoticed by the other parties. Respondents have met the burden of proof on the competition issue. Staff and the California intervenors have not. The state of the record is such that Respondents have made every possible showing of competition, and, further, they have shown that this competition is sufficient, under a majority of the contracts, to provide a meaningful methodology for determination of just and reasonable rates. It is no answer to say that the producing industry has not met its burden. The burden of proof is not solely on Respondents. Although this proceeding involves Section 4(e) filings, where the burden is expressly placed on producers, it is essentially a Section 5(a) proceeding in which our Staff must make the proper showing. Nevertheless, this case cannot turn on the burden of proof. There is sufficient evidence on all issues. Furthermore, that this is a regulatory proceeding does not detract from thorough consideration of relevant economic evidence to ascertain whether producers exercise undue powers over price. Certainly there is no basis for a presumption that there is no competition. The ramifications of the order we issue today require comprehensive and meaningful treatment of this issue.

Briefly, the record shows that, of all producers in the Permian, 361 were named in the order initiating this proceeding, but no one of these sells over eight per cent of the gas produced on a national basis. In addition, at least 2,280 producers in the Permian Basin supply gas to processing plants under percentage contracts. In the aggregate, there were 54 producers in 1960 who sold over ten million Mcf of gas per year. In the Permian Basin there are 20 producers selling some 80% of the gas produced. These numbers and sizes necessarily raise the presumption that there is such a degree of self-interested rivalry and of independent action as to preclude a presumption of concerted action. On the other hand, there is not a scintilla of evidence that any of the producers have ever acted collusively; they have not exercised their power in a manner harmful to the competitive market. There has been no parallelism in prices to indicate action by any producers to control price. This stands out clearly:[11]

Year	Company	Number of contracts	Price range

[1] Renegotiated.

[11] Respondent's Exhibit No. 25, Schedules 12 and 13.

Such a vast range in prices over the period of almost a decade certainly is suggestive of the fact that all producers, or even the major sellers do not exercise effective monopoly powers.

There is relative ease of entry into the business. Such discrimination as may exist comes, not from producers, but pipelines. Further, it must be emphasized that such factors as a rapid growth rate, excess capacity, and meeting the prices of a rival are conditions to be expected in a market that is rapidly expanding and coming into its own. The opening of markets and the high rate of technical progress usually characteristic of such a situation make for uncertainty as to the most profitable policies. Any uncertainty of prices under contracts, even when Transwestern broke El Paso's monopoly, reflects on more than unprecedented demand and not monopoly control by producers.

The sole non-competitive factor has been the long-term contract, required by this Commission as a condition precedent to certification. Early uncertainty as to the proper prices for natural gas and particularly its use as a waste product acerbated this twenty-year pricing policy by compelling producers to insist on various indefinite escalation clauses to the end that, once stable prices were realized at a level that returned costs to the producer, each seller would so benefit. These clauses have been negotiated in the Permian since at least 1945 when El Paso contracted with Phillips for a sale of gas at 3.5¢ per Mcf, but subject to indefinite escalation based upon El Paso's resale rates at the California border. Since the middle of the last decade, such indefinite escalations have been uniformly condemned. The following comment is relevant:[12]

> Many witnesses appearing before the committee, particularly those representing distributing interests and consumer areas, maintained that escalation clauses in existing contracts, unless their operation is controlled in some effective manner, could result in very large increases in the cost of gas to consumers—particularly in view of the fact that a contract for natural gas usually runs for 20 years or more, and a large proportion of the contracts presently in effect were entered into in recent years * * *
>
> It is provided * * * that where a rate increase is based on a price increase resulting from the operation of an escalation clause [except the so-called step-up and tax-increase clauses] in an existing contract the Commission may not consider as an operating expense for the purchase of such natural gas any part of the increase in price which results in a price in excess of the reasonable market price therefore.

We have endorsed the above recommendation by prohibiting the prospective operation of such clauses.[13] Our opinion today permits their further operation only to the extent they were negotiated in past periods and in any event such escalations cannot exceed the ceiling rates. Looking to the future the extensive impact of limited price increases in new contracts cannot approach the increases realized in the last decade. Thus, by this determination, there is a solution to the single factor that has compromised workable competition.

Finally, in determining the competition issue, it is relevant to consider an energy market broader than the natural gas industry of the Permian Basin. It is clear that natural gas is presently sold at a level competitive with other fuels and sources of energy. This is particularly the case on a national basis, and is the result of continuing economies in the coal and electric industries. If our analysis is expanded beyond the Permian to take cognizance of this national

energy market, there is evidence of those conditions that would indicate restrictive economic forces. There are alternative energy sources to provide an independent determinative of prices. The consumer's individual outlay does not restrict his freedom to select alternative sources; the energy market is in a state of equilibrium. For this reason, if no other, transmission companies cannot disregard the prices paid to producers, and, particularly for the future, it cannot be assumed that the pipelines do not have the same interest in their investment as the distributors have in their related investment.

Reliance on the price rise to justify a conclusion of producer price-dictation must falter in the face of overwhelming evidence that this rise was parallel to the rise in all other price indices, that the price rise reflected the elevation in the value of natural gas to a level that would return to the producer his reasonable costs, and that there is competition sufficient for our regulatory purposes. For these reasons, I rely upon the reasonable market prices in addition to the cost considerations in our decision.

JUST AND REASONABLE RATES BASED ON CONTRACTS

Far from undercutting our power to impose effective price ceilings, a price-demand approach would retain flexibility and would still present a direct relationship between cost considerations and the price ceiling. In view of the cost presentation herein, it appears that in the future reliance on competitive forces should be sufficient. The independent operation of substantial parts of the market will provide an average price accommodating to the mandate that controls be imposed upon prices for natural gas. To the extent possible, one part of an essentially joint product will be regulated in a manner responsive to the needs of both the industry and the consumer. So long as most producers can operate under a compulsory price ceiling, the supplies will be available, and by that ceiling the consumer will be protected from price escalations that are not acceptable. The question becomes one of methodology. Although it might be preferable to enact legislation to abandon any effort at price control other than such reasonable restraints as might be imposed upon pipelines, such limited controls are not totally removed from a method that has proven successful in the last few years.

Relevance of our in-line pricing policies

Following the Supreme Court's mandate in *Atlantic Refining Company* v. *F.P.C.* (*CATCO*), 360 U.S. 378 (1959), the Commission has followed a course in Section 7 proceedings of fixing ceilings at reasonable rates relevant to the existing market. It has thereby centered its attention on the weighted average prices under contracts which provide for the sale of substantial volumes of natural gas in interstate commerce. Indefinite escalation provisions have been removed, and rate increase moratoria have been imposed. Attention has been directed to permanent and temporary certificates covering contract rates, and the Commission has strenuously resisted all attempts to interject cost presentations submitted on an individual company basis. It has thus been successful in effectuating, simply, quickly, and with minimal disruption, what five years of agitation and uncertainty, fraught with numerous procedural disruptions, can scarcely improve upon: fixed rates that are sufficiently high to induce adequate reserve accretions and yet with provisions for rate increases that would be so gradual that any unpredictable economic disruption at the distribution end of the natural gas industry would be precluded. Although the procedure was notably unrefined, it has likewise proven to be remarkably efficacious. The in-line procedure took the notable step of avoiding cost-plus producer regulation and thereby illustrated

that a "sane, sensible, and effective" course to producer regulation was available. Significantly, it represented initial development of the policies we adopt today. Nevertheless, since in-line proceedings arise under Section 7, it is appropriate that there be a more thorough analysis of contract prices when consideration is given the standards of Sections 5(a) and 4(e). Thus, the Ninth Circuit has stated that the provisions of Section 7 for certificates of public convenience and necessity do "not mean that before certificating such a sale the Commission must determine that the proposed initial price is just and reasonable [by Sections 5(a) and 4(e)]." *United Gas Improvement Co.* v. *F.P.C.*, 283 F. 2d 817, 822 (9th Cir. 1961).

The record in this case provides substantial evidence that in the future we should perfect a system of producer regulation that considers costs, but relies on the competitive forces, which in themselves provide an independent determinant to prices apart from what producers might prefer to dictate. Thus, the logical focus of producer regulation on an area basis lies in the negotiated field contracts. They are executed under circumstances of market compulsion after full consideration by persons intimately associated with the industry of all the factors that a regulatory agency can only estimate. These contract prices provide a privately litigated answer to the question of what rates will be necessary to get the gas out of the ground. Any meaningful system of regulation would appraise the level of these prices as determined by arm's-length bargaining in a competitive market. The analysis should include intrastate prices for that market will provide useful information for comparative purposes. While it is to be expected that regulation will distort a competitive market, contracts continue to be negotiated above these ceilings, and in-line price conditions are refused by producers in favor of other markets. Finally, since costs now approximate revenues, it should follow that competitive prices would accordingly be in-line.

The focus on contracts would remain constant unless there were important departures in direct relation to current experiences and projections of production volumes, exploration and development expenditures, drilling success ratios, market demand reserve additions, and the general cost indicia of the national economy. Of these several economic indicia, the single most important one is the reserves added each year. This is the crucial measure of the ability of just and reasonable rates to elicit the necessary supply. For present purposes it is apparent that field negotiations have been successful in eliciting supply, and that no specific reserves to production ratio should be required. The other important economic indicia are exploration and development expenditures and drilling success ratios. Both are joint costs of the oil and gas industry, but substantial deviations of either over the long term will require corresponding rate adjustments. Necessarily, both relate to the supply elicited. It is these relationships that can best assist us in a determination of whether regulatory controls are successful in meeting current and projected needs. If adequate reserves were being elicited, an uncomplicated, practical decision would be one which imposed a single ceiling approximating the initial price mode or median for new contracts. If additions were excessive, based on current ratios, the ceiling could be lowered to inhibit exploration and dedication of further volumes to interstate commerce. If additions were deficient, the single ceiling would be adjusted proportionately upward, and, if the reserve posture required even more drastic remedies, contract rates could be increased upward pursuant to Section 5(a) as construed in *F.P.C.* v. *Sierra Pacific Power Co.*, 350 U.S. 348 (1956). Finally, if specific rates were unduly discriminatory or preferential

in specific cases they could be adjusted within the purport of just and reasonable rates.

Such a policy could be implemented with a minimum of time and expense. The regulatory burden would be greatly relieved, and Federal expenses would concomitantly be reduced. Although an orderly conclusion of pending area rate cases is presently required, contracts should provide an expeditious basis for setting just and reasonable rates in all other producing areas. Ancillary benefits would follow as cost-plus thinking is de-emphasized. More meaningful reserve data would be obtained. Difficult allocations could be of more limited impact. Cost questionnaires, indicative of whether trends in well-head prices were approximating general indices, would be far more simple and consequently far less expensive to complete. Since prices would be established expeditiously, they would be maintained current without resort to figures and testimony that are five years old. This would be achieved in addition to our current policy, clearly the most consumer-conscious yet effected, of imposing increased limitations to maintain current prices with provisions for filing for moderate increases in accordance with market determinations and other general economic trends.

The Reasonable Market Prices

Subject to these additional views on the course we should take in establishing just and reasonable area rates for the Permian Basin, I concur fully in the Commission's opinion. Our opinion establishes that profit-oriented costs and supply-oriented contracts do not, in the aggregate, depart in any significant manner from each other. To the contrary, an analysis of market prices establishes that contracts have apparently approached costs for the natural gas industry in the Permian, and, for the past few years, have maintained a level close to the costs analysis we here adopt. This is a significant stabilization. Thereby, a market price has been established which provides a reasonable measure of the rate necessary to elicit supply. From the record in this proceeding, for the period with which we are concerned, the overwhelming volumes of gas-well gas are sold under new contracts at the weighted average price of approximately 16.5¢. Considering this close proximity of the contract average to composite costs, it is clear that, by either standard, the rates we prescribe for the Permian Basin are just and reasonable.

The record establishes that, for all filed contracts in a seven-year period before and after 1960, there was a range in prices from 2.15¢ to 18.0¢.[14] The weighted average price for these contracts, based on volume, was 14.20¢ for 1962. This price is based on the initial contract price, and it is not shown what adjustments, if any, were provided for quality, taxes, and other circumstances. These have a definite impact on the regulatory rate we must establish. More particularly, as of early 1962, approximately one-half of the volumes sold was at an upward range from 15.0¢ to 17.0¢. Under various periodic escalations this price could be increased, by the end of 1968, to a price ranging from 16.0¢ to 18.0¢, with the overwhelming volumes being sold at prices approaching 18.0¢. Since we here intend price control up to an earlier date, Respondent's contract testimony is commensurate with the just and reasonable rate for the period. Other testimony establishes that, for contracts dated subsequent to 1960 but prior to the middle of 1963, the base prices range from 9.0¢ to 17.0¢ for gas-well gas, with the larger volumes flowing at rates ranging from 15.5¢ to 17.0¢ with the largest volumes at 16.0¢.[15] Based upon this survey of base prices under contracts, some as reduced under certificate conditions and accepted by producers, the 16.5¢

[14] Respondent's Exhibit No. 252.
[15] Staff's Exhibit No. 317A.

rate established by our cost analysis is clearly within the range of contract prices.

There are limitations in relying solely on the above evidence, primarily because various adjustments for deviations from the standards for pipeline gas are not necessarily reflected in the contract price for new gas-well gas. The weighted average contract price for gas-well gas is 14.76¢, apparently after certain proportionate adjustments to reflect deficiencies.[16] Among others, these deficiencies include excessive sulphur and hydrogen sulfide content, excessive water content, below standard pressure, and excessive carbon dioxide in the gas. From the record it appears that the possible range for specific adjustments will be from three to five cents; however, for all adjustments that might be necessary, the reasonable amount of the average adjustment will be in a range of from 1.0¢ to 1.7¢.[17] Adding this adjustment to the average weighted price of 14.76¢ a ceiling is indicated of from 16.0¢ to just below 16.5¢. In accordance with a policy of rounding upward, this would mean that a price of 16.5¢ is the just and reasonable rate for new gas-well gas.

Further analysis of the record evidence supports the above conclusion.[18] Since the contract prices must be considered in the light of the quality of gas sold, it appears clear that, of the limited volumes of gas sold at pipeline quality standards, the 16.5¢ rate is clearly in line. The highest price for new gas-well gas is 17.0¢, which was paid for an estimated annual volume of 2,126,400 Mcf under six rate schedules. All of this gas appears to meet pipeline quality standards, except for 180,000 Mcf of gas sold under one contract allowing a lower Btu content and containing no specification as to water content. A larger quantity of new gas-well gas was sold at 16.0¢—6,149,336 Mcf to El Paso, 9,751,680 Mcf to Transwestern, 2,444,772 Mcf to Northern, and 958,320 Mcf to West Texas Gathering Company. All contracts for sales to West Texas Gathering Company would allow delivery of "sour" gas. The 16.0¢ price might have been higher had the gas been required to be of pipeline quality. These contracts are silent with respect to water content. Contracts governing the 2,444,722 Mcf sold to Northern provided for a minimum Btu content ranging between 950 and 1,000 and had no provision with respect to water content. These contract provisions do not reveal the actual quality of gas delivered, but again it appears that the 16.0¢ price would probably have been higher for higher quality gas. It is indicated that a 16.0¢ price paid by Transwestern was negotiated despite variations in the quality of gas. Some 420,000 Mcf sold under three contracts is subject to contract provisions requiring that the gas meet all pipeline quality standards save that the contract is silent with respect to water. The actual water content of the gas delivered cannot be determined. The remainder of the gas appears to be below standard in either pressure or in hydrogen sulphide content. Some 1,108,000 Mcf of this gas may also be deficient in Btu content, and about 6,475,000 Mcf of this gas moves under contracts which provide no standard with respect to water. The El Paso contracts at 16.0¢ are uniform in fixing delivery pressure at 1,000 pounds but are silent on most of the other quality standards.

At the contract price of 15.0¢, estimated annual volumes of 8,433,048 Mcf of new gas-well gas were sold to El Paso and 2,007,324 Mcf to Northern. The 26 El

---

[16] Staff's Exhibit No. 334.

[17] A precise adjustment for quality cannot be ascertained from the contract exhibits in this proceeding. The Examiner made a general determination that one cent would be appropriate. See Examiner's Decision, *infra*, pp. 368–372. Subject to developments under the quality adjustment procedures we establish, the range is presently appropriate.

[18] Staff's Exhibit No. 334.

Paso contracts at this level are, with two exceptions, silent as to water content. Eleven of them require pipeline standards with respect to sulphur and hydrogen sulphide. One is silent on this subject, and the remaining 14, totaling nearly 3.5 million Mcf, do not require pipeline standards with respect to sulphur. Pressure appears to be below pipeline standards in the case of the majority of the 15.0¢ gas sold to El Paso, and possible Btu content deficiencies are indicated with respect to about one-third of this gas. The three contracts at 15.0¢ for sale of new gas-well gas to Northern provide for pipeline quality standards in all respects save that no standard was provided with respect to water content. Again we have no information as to the actual water content of the gas delivered. From the above it must be concluded that new gas-well gas delivered at prices below 15.0¢ is, from the record before us, deficient with respect to one or more quality standards.

Attention should be called to the fact that the prices set forth in this exhibit are not for all the market sales of gas in the Permian Basin Area. No information was included in this record as to particular nonjurisdictional sales although some attempt was made by the Staff to show that the average non-jurisdictional prices were lower than jurisdictional prices. I emphasize that such intrastate conditions of the market are relevant considerations to area pricing. Taking all these factors into consideration upon the evidence presented, it must be concluded that our price of 16.5¢ set for new gas-well gas is appropriate; therefore, a just and reasonable rate is established.

Despite the validity of the 15.5¢ base price (exclusive of State taxes) for new gas-well gas, it is not acceptable to the extent that there is not a full upward adjustment for high Btu content.

It is clear that the quality of a particular volume of natural gas has a definite impact on the value we should assign to that gas. Consumers are interested, not in Mcf's, but in the heating units derived therefrom. For variations from what is required to supply consumers adequate therms of gas, there should be proportionate adjustments. On the basis of the record before us it is a matter that is not readily susceptible to resolution, and, to determine the full extent of the adjustments that might be necessary, we have ordered procedures for negotiation of these matters.

It appears that natural gas from the Permian Basin is generally deficient in many of the standards required for pipeline quality as we have proposed in R–200, noticed at 18 F.R. 2.60, 2.61 (1961). A large amount of sour gas is found, there are several fields with large amounts of carbon dioxide, and low pressures are common. These deficiencies are to be reflected in downward adjustments from our base prices. On the other hand, Permian gas does have one quality—Btu content—that is apparently higher than is delivered to pipelines in other producing areas. I dissent from the anomalous position of requiring full downward adjustments for all quality deficiencies while denying to producers a right to obtain meaningful upward adjustment for the single quality standard that is above pipeline quality. I emphasize that this dual standard attacks the validity of our cost analysis since, absent proper upward adjustments, it is possible that producers will not recover their legitimate costs.

In our recent decision in *Texaco Inc.*, Opinion No. 464 (issued June 10, 1965), 33 FPC 1228, we determined that, for the Hugoton-Anadarko producing areas, 1000 Btu's was the standard for pipeline quality there. Significantly, we relied on the contract terms, although Staff had favored a weighted average base of approximately 1020 Btu's. It is appropriate to adopt area standards, but this being an area proceeding, all relevant circumstances should be considered. It is far from clear that the area standard for new gas-well gas is at 1050 Btu's. The weighted average for new gas-well gas is 1042, but this average is derived by excluding

carbon dioxide volumes; if the latter are included the weighted average is lowered to 1034 or lower. Furthermore, it should be noted that the weighted average for all gas flowing in 1960 appears to be at 1039 Btu's. If our attention is directed to the contract requirements of the pipelines, which is the standard for determining all the quality deficiencies, it is clear that the minimum required is 1000 Btu's or lower. The standard Btu provision imposed by the transmission companies for purposes of price adjustments or rejection is between 1000 and 950 Btu's, but the preponderance of the contracts requires 1000. The opinion is thereby left with an obvious gap of 50 Btu's by which producers are denied the benefits of the gas they sell. If we compare the area standard with the national standard, it is clearly at 1000 Btu's, as we have proposed in R–200. Finally, it appears that the 50 Btu gap is important solely to the California distributors as a result of the high Btu content in the gas delivered to them at the California border. The reasons for this high standard are not known; certainly no producer participated in the negotiations leading to these sales. Rather than approve a practice of unknown origin, I would rely on the uniform contract standard for the Permian area, for the Nation, and for our proposed R–200 to set an upward adjustment from 1000 Btu's for new gas-well gas.

There are major difficulties in basing regulation on contracts while adopting the directionality thesis. Under price-demand split-level pricing should be avoided. In addition, since the natural gas industry generates a large portion of its own capital, it thereby underwrites current exploration by the older production. Reinvestment is an accepted and necessary feature of the industry, and the revenues it receives must be a source of funds for continued and increased nationwide exploration and development. We can be assured that the needed gas will not be found unless we acknowledge a proper role to reinvestment. This conclusion is particularly compelling during a transition to effective just and reasonable rates. We must condition our determination today to developments under a two-price system. Directionality is presently acceptable as an exploratory device of the industry. Because of the variance in elasticity between casinghead gas and gas-well gas, price can be utilized as a device to elicit supply; however, such regulation must be premised on a two-price system to reflect market conditions. In these circumstances, the selection of a dividing line between old and new production can be made. In view of the necessary role of reinvestment and of the long pendency of these proceedings, the division date should be drawn between the years when reinvestment was the sole reliance and when directionality had begun to establish itself. Since this had occurred by 1960, I accordingly join in the division date for old and new gas. For the test year, the weighted average price for all flowing gas-well gas was below 14.5¢. Again, the record is deficient as to the quality of this gas. The record does establish that the weighted average revenues received for all gas-well gas flowing in 1960 was 13.05¢.[19] Applying an appropriate upward adjustment for quality deficiencies a price in the range of 14.0¢ and 14.5¢ is established. It is noted that this is a different standard for determining a price for old gas-well gas than for new. Nevertheless, it is an appropriate standard for determining a regulatory rate reflecting the price at which a majority of producers are able and willing to sell gas for a period encompassing several years during which costs were apparently being recovered. This is offset by the less demanding standard required for new gas-well gas to the end that an appropriate incentive is utilized. Further, the 14.5¢ ceiling applies to new casinghead gas and to

[19] Staff Exhibit No. 175, Schedule No. 1. It should be noted that the average initial price for gas-well gas sold in 1960 is 13.2¢. See Staff Exhibit No. 118.

residue gas from non-gas-well gas reservoirs. This reflects the relative inelasticity of those types of gas. Therefore, it can be concluded on the present record that the cost-plus rate of 14.5¢ for flowing gas is the just and reasonable rate, and I accordingly support the rate design prescribed. For future proceedings our opinion should lend support to this simpler and more realistic approach.

It follows from my dissent as to the appropriate Btu standard that I also dissent from the determination to permit an upward Btu adjustment only for new gas-well gas. The fact that tremendous volumes of high Btu content gas are sold in residue gas, in casinghead gas, and in old gas-well gas is not considered, although our quality standards otherwise apply to all types of gas. I cannot condone this discriminatory determination. Upward Btu adjustment from a base of 1000 should be applied to all gas from the Permian Basin. I would note that the additional revenues to the producers as a result of the 1050 standard will apparently be so minimal as to be meaningless. The better course would be to avoid any standard pending developments under the quality adjustment procedures.

Although I believe a more complete discussion of just and reasonable market prices should have been added to supplement the reliance solely on cost-plus, I support the rationale in the main opinion. The cost analysis there employed is not only reasonable; more important, it is a feasible synthesis of the cost evidence before us. Such costs are most useful as a basis for comparison to the contract prices. Our proceeding has established a significant point: there is no substantial difference between market and costs in the Permian. Either method is presently permissible for purposes of area ratemaking. Accordingly, with the single exception of the Btu standard, I join in the procedures recommended for applying and enforcing the prices determined here today.

Ross, *Commissioner, concurring and dissenting on limited issue:*

The instant decision represents, in my opinion, a noteworthy advance toward the goal of effective producer regulation and one which, with but one exception, I fully support. In addition to the Examiner and the parties, we are indeed indebted to our Staff and our predecessors on the Commission for their ingenuity in suggesting the concept of the area approach and for beginning this case.

The decision properly recognizes that the basic purpose of the Commission's rate regulation is to assure for the consumers of this nation an adequate supply of gas at reasonable prices. In the course of developing a methodology to meet this objective the majority significantly expresses a flexible and receptive attitude towards certain issues that were not adequately developed by the parties in this first attempt at area producer regulation, notably capitalization of E&D costs and the usefulness of econometric presentations. My principal purpose in writing this separate statement is to emphasize and focus attention on the changes forecast by the majority, and to suggest future potential refinements in both the methodology and basic data.

While the decision is essentially sound, there can be little dispute that the margin of error will be narrowed as more complete and meaningful data are made available. Surely regulators should not be expected to vouch for absolute accuracy of their predictions without comprehensive and comprehensible gas reserve information.

Since the advent of electronic computers, econometrics has become increasingly useful in many fields as a tool for analyzing complicated economic problems. For the first time in a proceeding before this Commission, an attempt was made to analyze and test the complex interaction of regulatory and market factors with the aid of such advanced statistical and mathematical techniques. The Staff's

econometric studies, commonly referred to as the Wein model, were a commendable effort to clarify the supply-eliciting function of natural gas field prices. This is one of the strongly contested and critical issues in this proceeding. The producers, drawing mainly on an analogy with unregulated competitive markets, argued that higher gas prices will elicit larger supplies. The Staff, on the other hand, stressed the inherent limitations on the industry's ability to respond to changes in gas prices. According to the Staff's presentation, the economic determinants of future gas supply include not only the price of gas, which is being fixed in this proceeding, but also various other factors such as the determinants of market demand, the price of oil, and the success ratio in exploratory drilling.

One valuable feature of the Staff's studies is the attempt to identify and quantify both the direct incentive effect of price on exploratory activity and the indirect "feedback" effects on supply due to the price elasticity of gas demand under conditions of inter-fuel competition in the market place. These opposing effects, as well as the independent effect of oil prices on exploratory activity, cannot be assessed profitably in the abstract, *i.e.*, by gut reaction, but should be quantified, if at all possible, in the interest of more informed regulation under the Natural Gas Act. An example of this questioning attitude is Staff's refusal to accept automatically the proposition that the supply-eliciting function of price in unregulated competitive markets, where price is the result of the push and pull of impersonal market forces, is duplicated in the gas producing industry.

In the long run, I am confident that such analyses will provide fresh insights into the behavior of natural gas supply. I am also confident that this modern economic tool, as it becomes better known, will be adopted by the industry for its own use. Inevitably, this will result in a better understanding of the industry both for the manager, the regulator and the consumer.

In view of the fact that directionality with a two price system has been accepted by the Commission, it is inappropriate for this reason alone to use the results of Staff's studies. Their usefulness in the context of this case has been to cause everyone to wonder about and question the heretofore unchallenged hypotheses of the petroleum industry. When better developed, I am sure the results will provide both a practical and *legal* foundation for better gas producer regulation. I am therefore looking forward to the continuing use and refinement of the application of econometric and other advanced analytical techniques to the difficult task of producer regulation in future proceedings. Surely we should strive for more objective evaluation of economic matters in contrast to relying on our "feel" in such situations.

In view of the basic approach adopted in the decision, the desirability of establishing future area rates in the context of a nation-wide proceeding—from both an economic and administrative standpoint—is strikingly confirmed. The price for new gas is based entirely on a nation-wide rationale and on nation-wide data. This same basis is used to support the price determined for all other gas. As the decision concludes, the search for gas is conducted on a national basis. This is true not only with respect to producers but increasingly regarding the pipelines as well. The evaluation of location on price, the importance of which the decision affirms, can be determined much more effectively—if not exclusively—in a proceeding which considers the interrelationships of the various areas of supply with the markets they serve.

From a purely administrative point of view, a nationwide proceeding is a practical necessity. This marks only the first area case, which covers three producing areas. At this time final decisions in the three pending area cases involving eight producing areas are far from imminent; yet a further consideration of Permian rates will be due in a relatively brief two and one-half years.

At this rate of progress, a review of Southern Louisiana rates could be due even before the Hugoton-Anadarko cases are concluded. It is easy to see that the Commission could well become involved in the determination and redetermination of the rates for but a fraction of the producing areas in the country, and never complete the job of determining the rates for all of the producing areas. Either this will be the result, or the Commission as well as the industry and other interested parties will be required to add tremendously to their staffs.

Considering area rates within the framework of a national proceeding would also obviate the necessity of plowing the same old ground time and time and time again. Area proceedings involve substantial time and cost not only for the parties but also for the Commission and its staff. While separate area proceedings have advantages for the first couple of cases, the law of diminishing returns rapidly takes over.

Another aspect of our decision which is ripe for further consideration concerns a method of pricing new gas, commonly referred to as project accounting. This method visualizes a project consisting of the finding of a given volume of non-associated gas reserves by the drilling effort in a specific test year (*e.g.*, 1960) and the subsequent production of that gas over an assumed depletion period. All necessary outlays to acquire the capital assets (*i.e.*, the reserves), together with an appropriate return on the investment over its productive life, are assumed to be recovered through the revenues traceable to the initial investment. Cash production expenses related to the lifting of the gas to the wellhead are also estimated and added to the investment charges to arrive at a total cost per Mcf to be recouped on a unit-of-production basis over the depletion period. This cost model, which capitalizes all investment outlays relating to the acquisition of the asset and then allows a return thereon during its period of commitment, requires what is sometimes called a "true yield". The acceptable method of determining such a rate is an investor-demand type of study focusing on the "capital attraction" rate or the experienced cost of borrowing in the capital market. This is the rate of return standard that is commonly applied by the Commission in regulating natural gas pipelines and electric utilities.

This method can be compared with that employed by the Examiner and adopted by the Commission which is probably best characterized as a form of cross-section accounting. Under the latter method, the costs are estimated for the volumes produced in a given year, assuming equal production from a universe of gas producing properties equally distributed by vintages (thus cross-cutting all vintage projects). Further, under a convention of accounting in the petroleum producing industry, but without logic in economic costing, the cost model of the distributors capitalizes only the cost directly associated with productive properties, which is only a portion of the total cash outlays made in acquisition of the reserves. Outlays for dry holes and other expenditures not directly associated with successful properties are presumed to be expensed in the year of outlay, rather than to be recovered in future years from the revenues of producing properties discovered in the course of a general exploratory effort. Thus, E&D expenses, not related to the production or output of the given year, are substituted for those E&D outlays of previous years which were incurred in connection with the successful exploratory efforts and recouped in the given year when the reserves are being produced. Cash production expense, depreciation, depletion, and amortization expenses, and a return on investment computed on a cross-section basis are also charged on a unit-of-production basis.

In selecting a cost model for new gas-well gas, consideration must be given to the fundamental character of the economic costing problem. Unit costs of production for any commodity or service can only be arrived at by a careful match-

ing of all necessary inputs with the associated output. This matching must, because of the time value of money, adequately reflect the timing as well as the cost of all inputs. Inputs allowed must strictly relate causally to the output and all such inputs, with their timing, must be fully represented. The project method of accounting meets this basic requirement. In contrast, the other method expenses the portion of the capital outlays which relates to unproductive properties as if they were current operating costs, even though that portion is inseparable, at the initial planning stage, from the successful E&D outlays. Such expensing practices can lead to a distortion of the investors' allowed return from revenues generated by the initial investment.

In addition, an ancillary benefit of the project method lies in the fact that the somewhat discomforting aspect of "Adjustment for Exploration in Excess of Production", which seems to charge current rate payers for additions to a company's capital assets, is avoided.

This costing approach of capitalizing unsuccessful as well as successful well costs has substantial support within the accounting profession. Arthur Andersen & Co. has enunciated this position clearly and forcefully:

> The purpose of exploratory activity is to discover oil and gas reserves for future use. Discoveries, however, are unlikely without the incurrence of some exploration costs for unsuccessful ventures. Such costs are necessary in the search for and discovery of new deposits of oil and gas reserves. Exploration costs for unsuccessful ventures are as much a part of the cost of the oil and gas discovered and produced as are the direct costs of productive wells.
>
> Only a portion of the oil and gas reserves discovered is likely to be produced and sold in a given year. The matching of related costs and revenues logically requires that the portion of all costs, including exploration costs, applicable to the oil and gas currently produced be charged to expense in the period of production.
>
> Because of the hazardous and speculative nature of the oil and gas industry, most companies have expensed their exploration costs as incurred. This practice has ignored the real capital nature of these costs, and has resulted in financial statements that do not show the total cost of the oil and gas reserves or of the current production therefrom. When exploration costs are charged to expense as incurred, profits are reduced or losses are shown in the exploratory years, because a substantial portion of the costs then being charged off does not relate to the income of the current period but to the income to be derived from future production of oil or gas.[1]

In addition, an excerpt from *Asset Accounting*, by William A. Paton, 1952 edition (pages 440 and 441) states as follows:

> In developing a wasting asset the costs of all explorations may be capitalized, even if some specific operations don't pan out, as long as the program is being carried on in a reasonable manner in the light of prevailing standards and techniques.
>
> In the development of an oil lease, for example, several dry holes may be dug for each operation that proves to be productive. In this situation the cost of the dry holes may be regarded as a part of the cost of the activities that resulted favorably; like the falsework used in the creation of a building they represent preliminary operations necessary to the end result.

It should be emphasized, however, that this is not an endless road as the previous source cautions.

---

[1] *Accounting for Oil and Gas Exploration Costs*, Subject File OI 2220, Item 124, Arthur Andersen & Co., January 1963, page 4.

> This interpretation, of course, must not be pushed to the point of justifying as assets the cost of development operations not warranted in the first place or long continued without success. (Paton, *Asset Accounting, Ibid.*)

Thus, while it may be appropriate to capitalize those unsuccessful ventures which can be related to the finding of successful production, this should not be interpreted as a blank check for loading the rate base with any other costs which have no bearing on productive properties.

Despite the seeming advantages of the project cost model, the record in this proceeding contains a meager amount of evidence directed to estimating a true yield rate of return and relatively much more directed to finding a rate of return under the comparable earnings test which is employed in the cross-section accounting method. With some reluctance in view of the size of the record here, I nevertheless conclude that the evidence on the critical aspect of rate of return on a true yield basis is not adequate to support the use of this method in this case.

My sole exception to the decision relates to the date of division between new and old gas which the majority fix to be January 1, 1961. I dissent to that finding because it is fundamentally inconsistent with the very basis of the two-price system adopted by the majority. This system was first advanced by witness Kahn and applied by Roseman. Implicit and explicit in their testimony, and as the majority emphasize, the purpose of the two-price system, the purpose of a higher price for new gas, is to provide the incentive to find necessary new reserves. It is a rate designed to encourage the finding of gas in the future, for the future.

The majority's decision repeatedly emphasizes this rationale:

> *Looking to the future* we are establishing a pricing system that will encourage the industry to expand and perfect its ability to drill directionally so that revenues from gas consumers can increasingly be devoted to finding additional gas reserves. (p. 186) [emphasis added]
>
> The incentive is built into the two-price system. *It provides a price for the future* related to current and future costs and payable only to producers who discover gas-well gas and dedicate their discoveries to the interstate market. (p. 186) [emphasis added]
>
> If a one-price system were to be adopted, average historical costs—not the highest current costs—would necessarily serve as its foundation, and we have no assurance that such a price would elicit the investments at current cost levels which are needed to bring forth adequate new supplies of gas-well gas. (p. 186)
>
> * * * if such a ceiling were fixed high enough to elicit new gas-well supplies it would result in windfall profits for all other gas and if fixed low enough to reflect costs for old gas it would not assure adequate supplies for the future. (p. 187)
>
> * * * bring forth needed gas supplies in the future and this fact supports our conclusion to fix a higher ceiling for new gas-well gas which will encourage exploration at deeper horizons directed toward finding gas. (p. 188)
>
> The separate price we fix herein for new gas-well gas in the Permian Basin should serve to furnish a practical test of whether in fact it will result in bringing forth additional supplies. (p. 188)

It requires no lengthy citations from Webster's dictionary for one to understand that incentive or encouragement relates to the future—not to the past. No matter how hard it tries, the Commission simply cannot incite or encourage a producer to find and dedicate gas to interstate commerce which he is already selling, has been selling for up to four and one-half years, and for which he would need a specific order from the Commission before being free to discontinue.

Insofar as the majority relies on the issuance of the Policy Statement, the decision strikes a sharp blow at a basic purpose of the Natural Gas Act and the regulatory process. This Statement was issued without notice, without hearing, without any opportunity whatsoever for interested parties to comment. Reliance on such a Statement, the basis of which is devoid of support in the record, is improper. This is especially true since the Statement itself recited:

> It is anticipated that these differences in price levels will be reduced and eventually eliminated as subsequent experience brings about revisions in the prices in the various areas.

How ironic it must seem to the consumers of the nation that the opposite is true—that our "subsequent experience" is viewed in the light of the Policy Statement.

Looking to the future, it is easy to see that this approach will result in a crazy-quilt maze of old and new gas prices, depending on irrelevant factors such as the length of time required to try the case, and the particular test year used. Thus, "new" gas-well gas can be four and one-half years old in Permian; but in South Louisiana, assuming (but not predicting) a final decision in 1967, "new" gas-well gas will be nearly seven years old! This is some legacy.

Irrespective of how this aspect of the decision is viewed, it makes no sense. I therefore dissent to this aspect of the decision. In my view, the new gas price should relate to gas sold under contracts executed after the date of this decision.

In response to this position which was advanced by the California intervenors, the majority has no rebuttal. It simply states: "We believe, however, that the intervenors' argument proves too much * * *."

Lastly, in order to avoid any future misunderstanding, I wish to note my disagreement with the modifications of the Examiner's method of determining the old gas price as set out in the majority's decision.

In summary, this opinion is a beginning—albeit a good beginning—toward implementing our responsibilities to establish just and reasonable producer rates. I believe that with improvements, including those here suggested which the Commission indicates a willingness to consider, we will make further progress toward achieving a fair and effective system of producer regulation.

BLACK, *Commissioner, concurring:*

I join in today's historic decision but wish to express briefly my separate views with regard to the Commission's determination of rate of return.

In the final analysis the allowance for rate of return is a judgment consideration. With some reluctance I concur in the Commission's exercise of judgment that on the evidence before us 12% is not excessive. I do not feel, however, that the record strongly supports such a conclusion.

Because of the great numbers of producers who are affected by our decision in this proceeding and in the area rate cases to follow, the importance of a careful rate of return determination cannot be over emphasized. Translated into terms of the price of Permian gas, the difference between Staff's recommended 9.5% and the Commission's 12% is about 1.5¢ per Mcf for both new gas-well gas and flowing gas. This means about $11 million *annually to* jurisdictional purchasers of Permian gas, or nearly $4.5 million for every percentage point of rate of return.

Serious deficiencies exist in the presentation both of respondents and of the staff on the rate of return question. The Examiner's basis for adopting a 12% rate of return is equally unsatisfactory. It is based on the earnings experience of nine "highly successful" non-integrated companies whose sales represent only about 4.5% of all jurisdictional sales made in the Permian Basin. Of these nine companies (which in my view is a woefully inadequate number to constitute a

representative sampling) only three producers are primarily responsible for bringing the earnings up to the 12% average. And of these three, two were the smallest of any of the exhibit companies. Their total 1960 United States pipeline sales were, respectively, 5.2 million Mcf and 3.2 million Mcf. Their Permian Basin sales were, similarly, but an infinitesimal part of the total. It is apparently conceded that the non-integrated producer is not typical of Permian Basin gas producers; indeed, the conclusion is unavoidable. Respondents' witness stated on the record that the typical producer is the large integrated company, and that the non-integrated producers constitute a class that is constantly diminishing in number. It is inappropriate that they should have been separated out as the standard for employment of the comparable earnings test. They simply are not comparable.

The Commission avoids any discussion of the adequacy of the non-integrated producer as a basis for comparison and instead rests our case entirely on a discussion of the risks of natural gas production cast in the most general terms. My colleagues employ as the starting point the rates of return allowed jurisdictional pipeline companies, which fall into the range between 6.0% and 6.5%, and then seek to establish that natural gas production is a riskier business than natural gas transmission. I agree; but the translation of this added risk in terms of percentage points of return on investment has only marginal support in the record and we should acknowledge this to be the fact.

The principal risk which characterizes the operations of the independent producer is, as the main opinion properly notes, the dry hole—or non-commercial well—risk. The Commission points out that we are allowing the recovery of dryhole and associated costs as operating expenses in determining the area price for gas, but goes on to observe that "the uncertainty whether productivity will meet the industry average nevertheless remains as a risk for *each individual producer* * * *." We are not, of course, making rates on an individual basis. A return of 12% will not obviate the risk of each individual producer in the Permian Basin; nor for that matter will a 50% return. On the Commission's reasoning it could be argued that we would have to allow a rate of return which would cover the least successful operation in the area. A basic rationale of the area-pricing approach as noted more than once in the Commission's opinion is its inherent incentive to exploration. While individual producers may not, in fact, earn a given return on their investment, by the same token no individual producer is *restricted* to a particular return. Efficient, prudent management—or just plain good luck—can produce a return which in the context of individual company rate making would be termed vastly excessive. But under our approach such companies can keep the fruits of their good fortune.

We are making rates for the industry as a whole, and the Commission properly observes that "there is a degree of predictability to production operations as evidenced by the fact that the industry as a whole has maintained over extended periods a consistent record of new discoveries and added reserves."

The main opinion effectively disposes of the producers' case for a 16–18% rate of return, and I will not comment further. I do, however, wish to address myself briefly to Staff's approach, which was joined by the California distributor intervenors, with the hope that the records in future area proceedings will provide the Commission with guidance to decide the proper rate of return on a more informed basis.

Staff's evidence, related to over-all earnings experience on total capital, includes the following:

(1) A national group of 35 companies, including both integrated and non-integrated oil and gas producers accounting for some 60% of reported 1960 pipeline sales in the United States. The simple average earnings of this group

for the years 1957–1961 amounted to 9.5%, the median 8.8% and the weighted average 9.3%.

(2) A selection of 31 companies in the Permian Basin (again including both integrated and non-integrated producers) selling 81% of all the gas sold in the Permian Basin in 1960. The same averaging techniques as applied to the national group produced returns of 9.5%, 8.9% and 9.3%, respectively.

Staff also made use of data published by financial institutions, notably the Chase Manhattan Bank and the First National City Bank of New York. The results (both for total manufacturing and for petroleum production and refining) are not markedly different than those produced by Staff's special studies. These statistics, together with information taken from the well-known *Fortune* magazine study of the 500 largest industrial companies, address themselves separately to a return on equity capital. Although today's Commission opinion does not speak in terms of a return on equity, it is nonetheless a traditional and important tool in arriving at a proper rate of return. Using Staff's selected integrated and nonintegrated companies, an over-all rate of return of 12% translates into 13.5% return on equity, assuming an equity ratio of 85%.

Chase Manhattan's group of companies (including Staff's selection) for the entire period *1934–1961* earned 9.44% on average total capital and 10.46% on average equity capital. For the five-year period 1957–1961 earnings on average total capital were 9.56% and 10.44% on average equity capital.

The First National City Bank figures, which included data for a large number of companies representing total manufacturing and a substantial group (124 in 1961) of petroleum production and refining companies, show for the petroleum companies a return of 9.66% on equity for the entire period 1925–1961 and 10.88% for the five-year period 1957–1961.

The *Fortune* study discloses an average of the mean rates of profit on equity for the petroleum industry to have been 8.88% for the years 1957–1961.

I cite these figures, not in an attempt to establish that the Commission's rate of return determination is erroneous, because I recognize that these statistics are in many respects not comparable and are likely subject to a variety of infirmities which make them inappropriate for the Commission to rely heavily on. My purpose is to indicate my belief that an over-all rate of return allowance of 12% is very probably a generous one.

In my view the principal infirmity in Staff's approach is the assumption that the unallocated earnings of the integrated producers necessarily reflects the level of earnings and thus the appropriate rate of return for the separate function of their gas production departments. Staff's position that the non-production operations of the integrated producers are riskier than those of gas production rests largely on argument. While it is true that the far-flung and diverse operations of the large integrated producers may be at least as risky over all as the production of natural gas, the record does not affirmatively support such a conclusion.

The Commission opinion asserts that "integrated returns are relevant to the instant issue" but notes that "Without a departmental segregation of costs and revenues, it is impossible to calculate production department returns."

Whether such a segregation can be made on another record or whether some other reliable means can be devised more accurately to reflect the earnings of gas producers on their jurisdictional investment, I express no opinion. I only emphasize my strong hope that the Commission's determination of rate of return will not be understood as some kind of immutable standard which we have developed in this pilot decision, or that it will discourage the vigorous and imaginative prosecution of the rate of return case in future area rate proceedings.

Perhaps the most important single reason for a liberal rate of return allow-

ance in the Permian Basin is that the greater part of Permian gas is substantially below pipeline quality. The Commission has provided for downward price adjustments to reflect these quality differentials with the result that much of the gas sold will not command the ceiling prices we have established.[1] The very strong likelihood that the producers will continue to find large amounts of substandard gas is characterized by the main opinion as a risk factor, and I agree that it is appropriate to reflect this special risk in rate of return, which may well be sufficient to justify a return allowance of 12%.

With the reservations noted above, I expressly concur.

[1] It should be noted, of course, that our allowance of upward adjustments in price to reflect heat value in excess of 1,050 Btu's without a corresponding downward adjustment until Btu content falls below 1,000 undeniably constitutes something of an offset to the producers' risk.

APPENDIX A

Docket No. AR61–1, *et al.*

PARTIES AND PROCEEDING CONSOLIDATED [1]

Part I

The order of December 23, 1960, made the following parties Respondents:

Abell, George T.
Ackers, D. E.
Ada Oil Co.
Adams & Ray
Aikman, Claude E.
Aldrich & Fullingim
Amerada Petroleum Corp.
American Trading & Production Corporation
Anderson-Prichard Oil Corp. (now Union Texas Petroleum, A Division of Allied Chemical Corporation)
Antweil, Morris R.
Ard Drilling Co., The
Argo Oil Corporation (now The Atlantic Refining Company)
Ashland Oil & Refining Co.

Part II

The following Respondents were eliminated as parties to the proceeding by subsequent orders of the Commission:

American Trading & Production Corp.
Barnes, R. C.
Bayview Oil Corporation
Bond Oil Corporation
Coline Oil Corporation
Columbian Carbon Company
Coronet Oil Company
Dansby, Ben, Jr.
Falcon Oil Corporation
Felmont Oil Corporation
Greene, Hazel
Halbouty, Michel T.
Hanlon-Boyle, Inc.
Howard, Alvin H. & D. E. Vasser
Indian Royalty Company
Kerr-McGee Oil Industries, Inc.
Maracaibo Oil Exploration Corp.
Mosser, H. J.
Poff, H. Bryan
Ryan, Katherine
Snowden, James H.
Tela Corporation
Terrill, J. W.
Young, Marshall R.

Part III

The following proceedings involving proposed increases in rates were consolidated. Proceedings marked with "*" are consolidated only insofar as they pertain to the Permian Basin, New Mexico and Texas Railroad Commission Districts Nos. 7–C and 8 areas. Regarding proceedings marked with "**", there remains open the question of the contractual support of the respondents to make

the increased rate filings. This question will be determined in *Amerada Petroleum Corporation, et al.*, Docket No. G–16117, *et al.*, and *Phillips Petroleum Company*, Docket No. G–11217, *et al.*

APPENDIX B

Docket No. AR61-1, *et al.*

The following discussion from the presiding examiner's initial decision, Appendix B, pp. 383, 384, is adopted by the Commission:

E. DRY HOLE COSTS

Roseman and Park divide dry hole costs on the basis of the relationship between successful oil and gas well footage averaged over a period of years. While this method might not be suitable for dealing with the dry hole costs of an individual company due to the variations in annual success ratios and productivity of successful drilling, as Respondent witness Porter showed, these variations tend to be minimized in the magnitude of the industry's total effort over a period of years. Therefore these witnesses' basic approach is sound on the industry level.

For the period 1955–60, Park determines the average annual dry hole footage and successful footage, separately for exploratory and developmental footage. This shows that 6.4 feet of dry holes were drilled for each successful exploratory foot, and 0.3 feet per successful developmental foot. These numbers are multiplied by the average annual gas footage, broken down between exploration and development, thus arriving at the total dry hole footage to be borne by gas-well gas. The total is then multiplied by the JAS 1960 average cost per foot for dry holes. The result is divided by the average annual reserve additions of gas-well gas to produce 1.56 cents per Mcf for dry holes. Park thus allocates dry hole costs in proportion to the relationship between successful gas footage and total successful footage.

Roseman also divides his dry hole footage between gas and oil in proportion to successful gas and oil footage, separately for "wildcat"[8] and other footage. He derives a combined ratio of 0.898 feet of dry hole per successful gas well footage as the weighted average for the period 1951–61. (The corresponding ratio for Park for the period 1955–60 is 0.891.) Then he takes the cost per dry hole foot drilled from the Census for 1958 and after adjustment computes the cost per Mcf of dry holes drilled.

Roseman makes three adjustments to the dry hole foot cost figure of $8.91, the Census figure for 1958.

The Appendix figures show a decline of 3.5 percent in dry hole drilling costs from the peak year 1958 to 1960. For the reasons previously given, it is appropriate to adjust the 1958 Census level by the trend actually experienced by the constant sample of companies in the Appendix. This adjustment reduces the cost per dry hole foot to $8.60 per foot.

Roseman makes a second adjustment to take account of the fact that gas wells are typically deeper and therefore more expensive than oil wells. Using the *Oil and Gas Journal* figures which show drilling footage by depth and by well type, and Appendix data which shows the Appendix cost per foot for 1960 in the various depth ranges, he finds that the average cost per foot of dry holes allocated to gas was 12 percent greater than it would have been, if depth had been disregarded.

Again, analysis of the figures allocated to gas by Roseman on the basis of successful wells at various depth ranges, indicates that the footage allotted to gas is 4 percent less than if, disregarding depth ranges, the allocation were

[8] *World Oil*, on which Park and Roseman rely for allocating dry hole costs, provides a breakdown between "wildcat" and total drilling. It appears that the term exploratory as used here by Park corresponds to the term "wildcat" used in *World Oil*.

made simply on the ratio of total successful gas well to oil well footage. This is a statistical indication that deeper wells tend to have a higher success ratio.[4] The combination of the second and third adjustments, an increase in cost of 12 percent for greater depth and a reduction of 4 percent for greater success ratio, results in an upward adjustment of 8.28 percent.

The adjusted cost per foot figure is $9.31 per foot which produces a cost of 1.42 cents per Mcf.

Roseman's trended Census cost per foot is preferred to Park's JAS cost. The JAS sample average cost reflects the overrepresentation of large producers, their deeper than average drilling, and consequent higher than average cost per foot. Roseman's adjustments which reflect the effects of depth and success ratios for gas wells are sound refinements. For these reasons Roseman's estimate of 1.42 cents is accepted.

The following discussion from the presiding examiner's initial decision, Appendix B, pp. 379–383, is adopted by the Commission:

B. LEASE ACQUISITION COSTS

Park, Roseman and Sherwin estimate lease acquisition costs for gas well gas on the basis of the relationship between lease acquisition costs and successful well drilling costs.

Data on leasehold acquisition costs in relation to successful drilling costs are available from the Staff Appendices B and C, the *Joint Association Survey* and the Chase Manhattan Bank's *Annual Analysis of the Petroleum Industry 1961* (Chase). Ratios between leasehold acquisition costs and successful drilling costs cannot be computed from the Chase data alone because the Chase drilling costs include lease equipment costs which cannot be broken out. However, the Chase figures for lease acquisition costs are separate. Roseman used this data and related it to the trended Census drilling costs (the Chase-Census results). The ratios from the above sources are shown for recent years below.

There is difficulty in using the data on this subject.

1. Lease acquisitions vary considerably from year to year and are significantly influenced by Federal offshore lease sales at which large blocks are sold at irregular intervals, chiefly to large producers. As shown below, the expenditures for leaseholds by the small producers have been stable in relation to drilling costs, while the expenditures of the large producers have varied significantly. Given the variability in the ratios, it is desirable to consider the results for a number of consecutive years. The JAS does not report any results for 1957 and 1958. The Chase-Census figures are available over a span of years and the Appendix data covers 1956–60.

* * * * * * *

Ratio of lease acquisition costs to successful well costs (percent)

(4) Exhibit 149, p. 45 and Exhibit 153, p. 12. Data in Exhibit 153 adjusted to separate out related lease equipment from reported total of "well equipment and related lease equipment."
N.A.=Not available.

To relate lease acquisitions to drilling cost, Roseman estimated drilling costs for oil and gas separately from the Census for 1958 and trended these results on the basis of the Appendix A experienced costs from 1957–60. The per foot results for oil and gas were applied to the total footage drilled of oil and gas wells as reported in *World Oil*, to obtain the total drilling costs for each year. As previously discussed, trending the drilling data on the basis of the trends shown in the Appendix A is a sound method for determining trends in drilling costs. Trending the 1958 drilling costs downward increases the ratio of lease acquisition costs to drilling costs. Roseman then relates the industry wide lease acquisition data of the Chase analysis to the trended industry drilling costs. He considers the annual ratios from 1955–61 * * * and correctly found no trend. He then determines the weighted average ratio for the years 1957–60 to be 26.4 percent, which provides a representative sample of years in which lease acquisition costs were at high and low levels. Applying this percentage to his drilling cost of 2.88 cents per Mcf for successful gas wells, determined from the first step, yields 0.76 cents per Mcf.

Sherwin's estimate for the relationship between lease acquisition costs and successful well costs is in the range of 33 to 37 percent. He begins with the Appendix data which for the years 1956–60 average 42 percent for the large producers and 26 percent for the small producers. He also considers the lower estimates of JAS and Chase. JAS doesn't cover the years 1957 and 1958, which the other estimates show were the two lowest years in any of the series. It is evident from the preceding table that for all the years JAS is available 1955, 1956, 1959, 1960, 1961, its ratios are never more than two percentage points higher than the Chase-Census ratios.

Sherwin's major reliance is the Appendix data for the large producers. The ratios for these large producers are much higher than either the JAS or the Chase-Census ratios. The ratio of 67 percent for 1960 is 29 percentage points above the JAS figure for that year and 30 points above the Chase-Census ratio. This last variance is probably due in part to extensive purchases by large producers of offshore leases at the federal sales occurring that year. Such lease sales are in the main confined to large producers and their affiliates, and are generally in large amounts. These transactions are reflected to a greater degree

in the Appendix results for the large producers than in the JAS or the Chase-Census results, because the national Appendix data underrepresent the small companies to a greater extent than the other two. Sherwin's upper limit of 37 percent is based in the main on an apparent trend in the results for the large Appendix producers for 1958, 1959 and 1960, 39 percent, 43 and 67 percent, respectively, although on other occasions he criticizes the use of Appendix data even for trending purposes. During this same period there is no trend in the ratios of the Appendix small producers. That three years is too short a period to establish a trend for this purpose is shown by the downward movement in 1961 for both the JAS and the Chase-Census ratios. In March 1962 there were large sales of offshore leases, and the 1962 data will probably reflect this, but the whole picture still indicates variability but no trend. Sherwin's estimate, being based largely on the least representative data, is rejected.

Witness Park combines his estimate for lease acquisitions with that for lease facilities. He estimates that these two items should amount to 50 percent of his already determined drilling costs per Mcf. Park's estimate is based in large part on his judgment and experience as an official of Texaco. He considered the JAS average results for these items for the years when this survey was published and the 1956–60 Staff average results for all Appendix B producers. Both show a ratio of 59 percent for lease acquisition costs and lease production facilities in relation to drilling costs. Park first adjusts this percentage downward to reflect the fact that lease production facilities are more extensive on oil leases. He then adjusts the percentage upward to a lesser extent to take account of the fact that gas wells are more widely spaced and drain a greater acreage than oil wells. These two judgment adjustments resulted in a net downward adjustment to 50 percent, of which Park assigns 40 percent for lease acquisitions and 10 percent to lease production facilities.

Park's 40 percent figure is higher than the JAS average ratio. Moreover, as previously noted, the JAS was not published for the years which the Chase-Census and Appendix ratios indicate were the two lowest in their respective series, 1957 and 1958. And, as previously noted, the JAS average is probably too high because it is overweighted by large companies whose acquisition costs are a higher proportion of well drilling costs than is true for the small companies. The average ratio for the years 1956–60 for all the Appendix B companies is 42 percent. The upward bias in the ratios resulting from the unrepresentativeness of Staff's companies has been discussed.

Park's upward adjustment is based on his experience that the spacing of gas wells is typically wider than for oil and therefore uses more acreage. He also gives his opinion that gas acreage is not correspondingly cheaper than oil acreage. He cites no study or data in support of his conclusion. He does not appear to have considered the relative values of oil or gas prospects. Park does not mention the factor that the drilling cost for gas wells is typically greater than for oil wells because of the greater depth of gas wells. This would tend to offset the effects in the relationship of possibly higher acquisition costs for gas acreage.

The record contains a single study which indicates that the cost of lease acquisitions for gas has not exceeded those for oil. In Schedule 7 of his Exhibit 224, Roseman relates the capital accounts for lease investment to the investment in lease and well equipment plus drilling cost for successful wells, classified by lease types. In other words he takes the gross historical investment in lease acquisitions for successful gas and oil leases, and relates this amount to the corresponding gross historical investment in successful wells and lease equipment. The study shows that lease acquisition investment was 22 percent for gas leases and 20 percent for oil leases. There is no dispute that lease facility costs on

successful oil leases are generally considerably greater than on gas properties. Hence it is probable that if the ratios were limited to the capital accounts for lease acquisition and successful wells, excluding the lease facilities, they would show that the ratio for gas leases was the same as or lower than for oil leases. In any event, the study indicates that the ratio of investment in lease acquisitions to total investment for successful leases is not significantly greater for gas than for oil. This study covers productive leaseholds only. The witness concludes that this limitation doesn't affect the comparison. There is no reason to expect that the respective ratios for oil and gas leases would be changed if leaseholds which are acquired and never go into production were to be included.

There is no evidence that recent investment in gas or oil leases would change the above ratios.

While not conclusive, this study indicates that it is a reasonable hypothesis that the ratio of lease acquisition costs to drilling costs is not significantly different for gas than for oil leases.

It is concluded that Roseman's estimate based on the Chase-Census ratio furnishes the most reasonable estimate for lease acquisition costs. Applying Roseman's ratio to his drilling costs yields 0.76 cents.

An analysis of the percentages in the table at p. 293 of this appendix setting out ratios of lease acquisition costs to successful well costs indicates additional grounds for supporting the presiding examiner's determination of lease acquisition costs. As the examiner noted, in each year for which JAS percentages are available they correspond closely to the Roseman percentages. In 1955 the two figures were the same; in 1956 the JAS figure was one percentage point higher; in 1959, 1960, and 1961 the JAS figure is higher by two percentage points. For 1957 and 1958 no JAS figures are available but the close correlation of the figures of JAS and Roseman for the years in which data is available would indicate that if JAS figures had been available for 1957 and 1958, they would have been close to the Roseman figures of 20 percent for 1957 and 23 percent for 1958. This would indicate that an average of the available JAS figures would be misleading and that a more representative average could be obtained by including figures for 1957 and 1958, based on the observed relationship to Roseman's figures. With this adjustment, the average of the JAS figures would be 28.5 percent, as compared with the 33 percent which is the average of JAS figures actually available. It seems clear therefore that the Roseman figures of 26.4 are not too low and we agree with the examiner that they should be accepted for the purpose of computing the lease acquisition cost.

APPENDIX C

Docket No. AR61–1, *et al.*

DETAILED ISSUES IN COMPUTING THE COST OF OLD GAS-WELL GAS

In this appendix we shall discuss in more detail several of the issues raised in connection with the historical cost of service determination of the cost for flowing gas at pp. 212–218.

Gas-Well Gas Produced from Combination Leases

Basic to the determination of production costs for old gas-well gas is the question of which lease categories should be included in the determination of such costs. There is no controversy over the inclusion of leases covering dry gas as well as gas condensate with and without lease separation. An issue has been raised, however, with respect to the inclusion of the so-called "combination lease", a term used to classify leases producing, or capable of producing, from both oil and gas reservoirs.

In computing its composite cost of gas-well gas, the Staff included data relating to gas-well gas from the combination leases for both production costs and for its E&D allowance. The producers concur in Staff's method insofar as it relates to E&D but contend that data from combination leases should be excluded from consideration in the production expenses and investment costs of gas-well gas because they involve unnecessary and unreliable additional allocations. The examiner pointed out that large amounts of gas-well gas are produced from the combination leases and that there are economies of joint operation which should be reflected in the costs.

Our decision to base the price of flowing gas upon the cost of gas-well gas was based in part on an effort to minimize the number and complexity of the necessary allocations. Furthermore, because the liquids represent a much smaller portion of the total in gas-well gas than in oil-well gas, such a cost is less dependent on allocations and more nearly represents an objective cost for the gas. With this in mind we must observe that to compute the corresponding production expenses and investment costs attributable to gas-well gas on the combination leases will require two distinct stages of allocations. The first stage is to divide the combination lease costs between all gas and all liquids by the use of the relative cost method. This must be done for all gas-well gas. However, there must then be a further breakdown of the costs assigned to gas between dry gas, condensate gas, with and without lease separation, and casing-head gas. This is a complex process, involving allocation formulas which are necessarily subject to dispute. Only when this step is taken can costs related to gas-well gas from combination leases be computed. If combination leases are excluded from the compilation of production costs the more complex two-stage allocation is avoided.

To utilize the costs of combination leases in determining production costs would involve the additional allocations which we believed should be avoided and would thus defeat a major purpose of limiting the cost to non-associated gas. There is nothing in the record to support the examiner's suggestion that somehow gas-well gas can be produced more economically on a combination lease. We believe the production expense and investment data for gas-well leases which cover some two-thirds of the gas-well gas produced in the area is fully representative of the costs for gas-well gas. Accordingly, combination leases will be excluded from the production cost computation of gas-well gas.

The use of combination leases in the computation of E&D, however, presents no further allocation problem. There are no E&D expenses directly associated with the combination leases. All that is needed to make the E&D computation are the volumes of liquid and gas produced from each type of well, and such volumes are available. Accordingly, we find that the data from the combination leases should be included in the calculation of E&D, which is consistent with the positions taken by both staff and respondents.

Allocation of Overheads

In addition to the costs directly associated with the producing leases there are certain costs which are incurred in connection with the producers' overall activities. These are corporate general costs and expenses, area and district costs and expenses, prepaid taxes and insurance, corporate general net investment, area and district net investment, and materials and supplies. Such overheads must first be allocated between operating functions (such as production and E&D, then between lease types, and finally between the gas and liquid products. There is no controversy about the allocation between operating functions, which was performed in most instances by the reporting companies

themselves. The specific issue concerning these overhead expenses is the allocation of such costs between the various types of leases.

The Staff allocated these overhead expenses to leases on the basis of direct lease costs and expenses, exclusive of DD&A (depreciation, depletion and amortization) for items which are expensed, and on the basis of relative gross investment in the leases for capital items and the materials and supplies. On the other hand the Major Producer Group would add DD&A to the direct lease cost and expenses as a basis for allocating the common, or overhead, expenses and would use net investment in the leases as the basis for allocating capital items and the materials and supplies.

The examiner adopted staff's methods of allocation, and we affirm the examiner's finding. First, as to the issue whether the overhead expenses should be spread over all of the direct expenses including DD&A, it is clear that they should not. Overhead expenses are largely supervisory expenses and have no bearing on DD&A, which are bookkeeping entries to reflect the use of the investment. They should be allocated on the basis of direct expenses being supervised, which are exclusive of DD&A.

The second question is whether to use gross or net investment as the basis for allocating capital items and materials and supplies, two of the items in the overhead category. In allocating the common investment items, gross investment more closely reflects management supervision than net investment which is affected by the amount of gas or oil already produced. The same is true for materials and supplies because such expenses continue regardless of whether the investment has been reduced by depreciation and depletion. We shall, therefore, allocate these two items on the basis of gross investment.

Reinjected Volumes

An important question relating to the volumes used in computing the cost of flowing gas is the treatment of gas that is produced from the well, but is reinjected for the purpose of improving operating efficiency and increasing the recovery of liquids. If the reinjected volumes are included the effect is to reduce the unit cost of gas sold below what it would have been if costs were applied only to volumes sold, and the volumes produced but reinjected were disregarded. This is true because the same costs would be spread over a greater volume.

Respondents maintain that reinjection operations relate only to cash production expenses, and that except for these expenses all other costs should be computed on the basis of the volumes sold, which would be a smaller volume (and at higher cost) than if the total volume produced including the volumes subsequently reinjected were used. On the other hand staff maintains that all costs—cash productions cost, DD&A, return on investment and exploration costs—should be applied to total volumes produced regardless of their disposition.

The use of total production volume, rather than sales volumes, in computing the cost per Mcf assures that the share of total production costs related to the liquids derived from reinjected gas are in fact borne by liquids. For example, costs of recycling include investment in reinjection wells and other equipment, which should be borne by the liquids. In our opinion the use of production volumes, an approach which was adopted by the examiner, is the proper one. The cost of obtaining the liquids is not confined to the current expense of lifting, processing, and reinjecting the gas; all the other expenses, such as production investment and the like, are necessary as well. If they were not incurred, there would be no gas to recycle for the benefit of the liquids.

The conclusion is in accord with our prior decision on this issue in *H. L. Hunt, et al.*, 28 FPC 897 (1962). In that case the Commission stated that pro-

duction volumes rather than sales volumes should be used in cost computation, and specifically mentioned recycled gas as included in production volumes.

> * * * For example gas that is recycled, gas used for off-lease purposes, gas used by other departments in drilling or production, and gas shifted to company gathering systems or plants all represent situations in which substantial volumes of gas may have been produced but would not be included in sales volumes.
>
> The overstatement of the unit cost of single product gas inherent in the use of sales volumes also distorts the allocation of joint product costs. For example it is obvious that under the relative cost method too much of the joint production costs will be allocated to gas if the production cost of gas-well gas has been overstated. [p. 902]

Application of Relative Cost Method

A. *General Approach*

As a preliminary matter we are confronted with a dispute over methodology. Phillips' Witness Cramer presented a variant of the relative cost method which has been referred to as the "Y" Ratio method. The relative cost method relies on an allocation ratio based on single product costs, but the "Y" Ratio method includes in its base the costs and production of joint products, which are the very costs to be allocated by the ratio to be derived.

The "Y" Ratio method requires the use of a cubic equation and results in a mathematical formulation that is solved with a computer. Complicated formulas, even mathematical ones, do not necessarily produce meaningful results. We are persuaded that the method proposed by Witness Cramer creates only an illusion of precision and is less meaningful than the relative cost method of allocation. Under these circumstances we agree with the examiner that no reason has been shown to adopt this method.

In applying the relative-cost method there are three detailed issues on which staff and the producer-respondents differ. One is whether gas condensate leases should be included in the gas leg, a second is whether shut-in leases should be included in the oil and gas legs, and the third is whether the joint products should be allocated on the basis of gross investment rather than on the basis of net investment.

B. *Gas Condensate Leases*

The Staff in deriving a gas leg added to the dry gas leases, the gas-condensate leases without lease separation but excluded the gas-condensate where lease separation occurred. Respondents argue that all condensate gas, both where lease separation took place and where it did not, should be included in the gas leg. In support of their position respondents urge that there is no difference from an operating and well investment standpoint between gas condensate leases and the dry gas leases which were included, and that all the gas condensate leases should be included to reflect representative conditions relating to production on joint product leases, because otherwise the gas leg is too small to be representative.

Essentially the respondents argue that all gas condensate production should be included in the gas leg because gas condensate and dry gas leases are similar. Their argument misses the point. Obviously if there is sufficient dry gas to provide a representative gas leg, no gas condensate at all should be added. If not, the issue is the extent to which gas-condensate lease types need be added to achieve representative conditions.

Producers responding to the Commission questionnaire for the major producers (Appendix B) produced 41,652,569 Mcf of dry gas in the Permian Basin in 1960, about 4 percent of their total gas production in that area. In computing the Permian Basin gas leg of such producers, staff added to this dry gas production 1,271,495 Mcf of gas-condensate gas produced by them from leases without lease separation.

In the past, in cases dealing with individual companies, the Commission has considered that a dry gas leg representing as little as 4 percent of the total gas production of a company was an inadequate sample, and has indicated that there should be added to the gas leg a portion of the gas condensate production for the purpose of obtaining a larger sample. *H. L. Hunt, et al., supra; Hunt Oil Company, et al., supra; Union Producing Co., et al., supra.* In none of these cases, however, did the amount of dry gas production approach the 41,652,569 Mcf of dry gas which would be the sample here if the gas leg were restricted to dry gas. Also, in the three cases cited, we were dealing with the nationwide production of individual companies and the only practicable method of enlarging the sample was to depart from a strictly single product leg and include a portion of the company's gas condensate production. In the present proceeding, however, if it were determined that the 41,652,569 Mcf of dry gas produced by the major producers in the Permian Basin were an inadequate sample it would still be possible to maintain an all dry gas leg by using the national production of dry gas by the same companies. Although the nationwide production of dry gas by these companies is only approximately 13 percent of their total gas production, it amounts to 862,395,237 Mcf annually, a production several time larger than all of that used in computing the gas leg in *Phillips Petroleum Company, supra* (226,681,178 Mcf). There is no question that the 862,395,237 Mcf is a sufficient volume for an adequate sample.

The total costs allocated to gas by the relative cost method vary only in a negligible amount, whether national production or Permian Basin production of dry gas is used as the sample. The Staff's inclusion of gas condensate without lease separation also has little effect. The computations of production costs are as follows:

Type of gas leg used	*Gas-well gas costs in cents per Mcf (at 12% rate of return)*
Nationwide dry gas production [1]	9.136
Permian Basin dry gas production	9.157
Permian Basin dry gas + gas condensate without lease separation	9.161

[1] This computation has been made using Permian Basin cost data but applying an allocation ratio derived from national statistics. We reassert that for flowing gas the area costs are to be used in computing production costs. The use of the national dry gas volumes would be for the sole purpose of developing allocation ratios.

It will be noted that the costs, as computed on the basis of an allocation ratio derived from national production, differ by approximately 0.02 cent per Mcf from the computation of such costs derived from the ratio of dry gas production in the Permian Basin, and that the ratio derived from Permian Basin production is more favorable to the producer-respondents. The computation actually used by the Staff, which included gas condensate without lease separation in determining the allocation ratio, varies from the determination made on the basis of the Permian dry gas only by approximately 0.004 cent, and, again, the miniscule difference is favorable to the producer-respondents.

We think that if there is an insufficient area dry gas leg the use of national dry gas production would be preferable to the inclusion of gas condensate production for the purpose of determining the allocation ratio. However, where an area gas leg is derived from dry gas volumes of 41,652,569 and where the use of national dry gas production would produce a result equivalent to use of the area dry gas production, we believe it is proper to use the area production leg. Since the inclusion in the gas leg of the small amount of gas condensate by staff resulted in such an insignificant difference in cost, for the purposes of this case we will adopt Staff's computation. Regardless of which of these two computations we choose, it would not alter the cost sufficiently to affect the price of old gas-well gas as herein determined.

C. *Shut-in Leases*

Staff in computing its gas leg and oil leg excluded shut-in leases for purposes of determining the allocation percentages, although the actual cost of the shut-in leases in the joint lease category is, of course, included in the joint cost when the allocations are applied. Respondent-producers contend that shut-in leases should be included in determining the allocation percentages, because they are part of the cost of producing gas and shut-in oil leases are part of the cost of producing oil. The issue has been previously determined by this Commission. "Non-producing properties should not be included in ascertaining the oil and gas legs for allocation of the joint production costs." *Hunt Oil Co., et al.*, 28 FPC 623, 624 (1962). Shut-in lease costs are not representative of the production costs of either gas wells or oil wells because they are essentially non-producers. Their inclusion in the oil and gas legs would distort an otherwise representative single product cost factor and thus defeat the underlying principle behind the relative cost allocation method.

D. *Gross or Net Investment*

In computing the gas leg and oil leg for determining the relative cost of the joint production, the separate costs of each product must include an element of return on investment. Rather than using net investment, Staff would allocate the return allowance on the joint production on the basis of gross investment in leases producing separate single products. Respondents would use net investment. They argue that the use of gross investment overlooks the fact that this particular use of the relative cost theory is applied to production investment for the sole purpose of computing a return on investment, and that such return is computed on net investment, not gross investment.

The fact that the purpose of the allocation is to compute a return on investment is irrelevant, the test being which method more nearly reflects the operating facts of the joint production. The basic fact which raises the issue between gross and net investment is that oil-only leases are generally more depleted than dry gas leases.[2] Thus, using net investment would tend to assign less cost to oil and more to gas than if gross investment is used. On joint product leases (except some combination leases), the depletion rate is the same for liquids as for gas. Allocation on the basis of the gross investment more nearly reflects that fact. If net investment is used as the basis for the allocation it would impose a comparatively greater burden on gas than oil because of the relatively

[2] Oil leases average 62 percent depletion, nationally, and 55 percent in the Permian Basin, contrasted with an average depletion for dry gas leases of 40 percent nationally and 37 percent in the Permian Basin.

lower net investment of the oil-only leases which are more repleted. Its use would not reflect the true state of affairs on many joint product leases. We shall, therefore, use gross investment for this allocation.

Lease Play Allowance

In our calculation of working capital for new gas, we included an additional allowance for lease play over and above the working capital allowance which would be justified under the traditional utility method.[2] The question arises as to whether this additional allowance should be permitted in the cost computation for flowing gas. In *Hunt Oil Company*, 28 FPC 623 (1962) and in *Union Producing Company*, 31 FPC 41 (1963) the Commission denied lease play allowances on the ground that since a year-end rate base was being utilized such an allowance was unwarranted. The rationale for this finding was that any money expended to obtain leases during the year would receive a full year's return, even though such properties may have been purchased late in the year. These cases were not precedents for excluding a lease play allowance under our new gas calculation since an average-year rate base and not a year-end rate base was being used. However, in the development of our composite cost of service for flowing gas, we are using a year-end rate base. Accordingly, in view of the findings made in the *Union Producing* and *Hunt* cases no additional allowance for lease plays is included in the cost calculation for flowing gas.

Computation of E&D Allowance

The Commission utilized the modified Btu method in allocating E&D costs. In its application of this method the Commission used an economic factor of 3.5 for lease liquids and 1.0 for all gas. The E&D costs related to the Appendix "B" respondents are set out on the following page of this appendix. The results are summarized below.

E&D allocated to gas-well gas

	Cost (return at 12%)	Unit cost (return at 12%)
		Cent per Mcf
Expense	$167,036,961	3.46
Return [1]	30,010,322	.62
Total	197,047,283	4.08

[1] In the costing of old gas, certain costs classified as E&D costs are "capitalized" and made part of an E&D rate base, while certain items are "expensed." In deriving the cost of new gas, no items except "expensed" items were classified as E&D, and, therefore, no separate E&D rate base was developed. All new gas cost items which were capitalized, regardless of whether they were applicable to E&D or production, were put into the production investment rate base. This distinction between old and new gas is one of accounting classification. The final cost computation under either method is not affected by this difference.

[2] In our computation of the new gas cost, there is a separate classification for working capital. In the development of a composite cost of service the working capital allowance is not set out separately but is combined with investment in property under the separate cost computation for production cost and E&D cost.

Allocation of Appendix B respondents' E&D costs using economic factors of 3.5 for liquids and 1.0 for all gas

	Volumes [1]		Unit Btu [1] (Millions per Bbl or Mcf)	Total Btu's [1] (million Btu's)	Economic factor	Adjusted Btu's (million Btu's)	Allocated expense		Allocated return allowance		Allocated expense and return allowance

[4] Return allowance data obtained from exhibit No. 168, schedule No. 6, line 33 times 12%.
[5] Summary of gas-well gas costs as computed by combining applicable costs related to gas only leases, gas condensate with lease separation leases, gas condensate no lease separation leases, and combined leases.

APPENDIX D

Docket No. AR61-1, *et al.*

RATE SCHEDULE - QUALITY STATEMENT

1. APPLICABLE SECTION 4(e) DOCKET NO(S). (If any) (Use space below if needed)

2. PRODUCER NAME

3. RATE SCHEDULE NO.

4. TYPE OF GAS (Check one)

A. ☐ NEW GAS-WELL GAS
B. ☐ RESIDUE GAS DERIVED FROM NEW GAS-WELL GAS
C. ☐ RESIDUE GAS NOT DERIVED FROM NEW GAS-WELL GAS
D. ☐ OLD GAS-WELL GAS
E. ☐ CASINGHEAD GAS
F. ☐ MIXED GAS (Give proportion of types A and B) _____

5. PLACE OF PRODUCTION (Give State, County, Field and Municipality)

6. QUALITY OF GAS	PRODUCER'S STATEMENT OF QUALITY AND TREATING COSTS		BUYER'S STATEMENT OF QUALITY AND TREATING COSTS (If same as producer, indicate by check mark)	
	CONTENT OR PRESSURE	COST PER MCF OF TREATING GAS TO PIPELINE STANDARDS	CONTENT OR PRESSURE	COST PER MCF OF TREATING GAS TO PIPELINE STANDARDS
A. HYDROGEN SULPHIDE CONTENT (In grains per Mcf)...				
B. TOTAL SULPHUR CONTENT (In grains per Mcf).....				
C. CO_2 CONTENT (Percentage of volume sold).....				
D. H_2O CONTENT (In pounds per Mcf).....				
E. CONTENT OF OTHER IMPURITIES (Indicate whether above or below customary commercial and pipeline standards).....				
F. ACTUAL DELIVERY PRESSURE (Pounds per square inch)				
G. TOTAL				
H. BTU CONTENT PER MCF (New gas well gas only).....				

7. APPLICABLE AREA CEILING RATE

cents per Mcf

8. BTU PRICE ADJUSTMENT * (State whether plus or minus)

cents per Mcf

9. APPLICABLE RATE (Ceiling rate less treating costs, with Btu adjustments if any *)

cents per Mcf

10. RATE HERE ESTABLISHED (Not above applicable ceiling rate as adjusted)

cents per Mcf

NOTHING HEREIN SHALL PREVENT THE SELLER FROM FILING FOR ANY INCREASED RATE PERMITTED BOTH BY THE CONTRACT (IN THE ABSENCE OF THIS STATEMENT) AND BY APPLICABLE ORDER OF THE FEDERAL POWER COMMISSION.

12. SIGNATURE OF SELLER, AGENT OR OPERATOR

11. DATE OF STATEMENT

13. SIGNATURE OF BUYER

NOTE:
THE TERMS HEREIN ARE THOSE USED IN THE OPINION OF THE FEDERAL POWER COMMISSION IN PERMIAN BASIN AREA RATE PROCEEDING, AR61-1. NEW GAS-WELL GAS IS NATURAL GAS DERIVED FROM GAS WELLS MOVING UNDER CONTRACTS DATED ON OR AFTER JANUARY 1, 1961. THE BURDEN IS UPON A PRODUCER TO ESTABLISH THAT PARTICULAR GAS IS NEW GAS-WELL GAS OR RESIDUE GAS DERIVED THEREFROM, AND ALSO TO ESTABLISH THE PERCENTAGE OF SUCH GAS PRESENT IN A SALE OF MIXED GAS.

* Btu price adjustment to be applied in case of new gas well gas only.

APPENDIX E

Docket No. AR61-1, *et al.*

APPLICATION FOR SMALL PRODUCER
CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY
(Section 157.40 of Regulations)

NOTE: Independent Producers of natural gas whose total jurisdictional sales on a nationwide basis for the preceding year, combined with those of "affiliated producers," were not in excess of 10,000,000 Mcf may file the information called for in the following forms(in four copies, to the Federal Power Commission, Washington D.C., 20426.) include volume of gas paid for but not taken under prepayment clauses or otherwise, and volumes of gas sold under other independent producer rate schedules in the proportion that the independent producer seeking to come within Section 157.40 has an interest in such sales. Do not include sales made pursuant to percentage sales contracts. If insufficient space is given for a complete answer, continue the answer on the reverse side, noting the relevant number.

1. NAME OF APPLICANT

2. STATE OF ORGANIZATION

3. LOCATION OF PRINCIPAL PLACE OF BUSINESS

4. TYPE OF ORGANIZATION (Corporation, partnership, joint venture, etc)

5. NAMES OF STATES IN WHICH AUTHORIZED TO DO BUSINESS

6. NAME, TITLE AND MAILING ADDRESS OF PERSON RESPONSIBLE FOR APPLICATION

NAME AND TITLE

MAILING ADDRESS

7. TOTAL JURISDICTIONAL SALES VOLUMES AT_____PSIA FOR PRECEDING YEAR

8. LIST ALL CERTIFICATES PRESENTLY HELD BY DOCKET NUMBER AND ALL CONTRACTS ON FILE WITH THE COMMISSION AS RATE SCHEDULES BY RATE SCHEDULE NAME AND NUMBER

9. IF APPLICANT DOES NOT HAVE ANY OUTSTANDING CERTIFICATES ISSUED BY THE COMMISSION FOR THE SALE OF GAS, LIST FOR EACH JURISDICTIONAL SALE OR TRANSPORTATION CONTRACT: (A) NAME OF PURCHASER; (B) SOURCES OF PRODUCTION BY STATE, COUNTY AND FIELD; (C) ANNUAL CONTRACT VOLUME DELIVERY OBLIGATION (indicate psia per Mcf); (D) TOTAL PRICE PER MCF AT TIME OF FILING

10. LIST ALL OWNERS OF MORE THAN 5 PERCENT INTEREST IN APPLICANT: (A) INDIVIDUAL NAME; (B) PERCENT OF OWNERSHIP

11. LIST ALL INTEREST OWNED BY THE INDIVIDUALLY NAMED OWNERS IN OTHER NATURAL GAS COMPANIES: (A) INDIVIDUAL NAME; (B) COMPANY NAMES; (C) PERCENT OF OWNERSHIP

12. LIST ANY POSITIONS HELD BY THESE INDIVIDUAL OWNERS IN APPLICANT COMPANY OR ANY OTHER NATURAL GAS COMPANY

13. IS APPLICANT OR ANY INDIVIDUAL OWNER LISTED, AFFILIATED WITH ANY PURCHASER OF JURISDICTIONAL GAS FROM APPLICANT (If so list name of buyer and seller for each such sale and nature of affiliation)

14. LIST ALL OWNERS OF MORE THAN 1/8TH INTEREST IN EACH GAS SALE CONTRACT TO BE COVERED BY THIS CERTIFICATE AND THE AMOUNT OF THEIR INTEREST.

Appendix F. Petitions to Intervene	415
Appendix G. Parties Filing Briefs	417

Wenner, *Presiding Examiner:* On September 28, 1960, in its decision in *Phillips Petroleum Company*, 24 FPC 537 (1960), *Wisconsin* v. *Federal Power Commission*, 373 U.S. 294 (1963), (*Phillips*), the Federal Power Commission decided that the characteristics of the natural gas production industry required the abandonment by the Commission of the individual company cost of service approach and that it adopt instead an area basis for regulating the price of gas sold in interstate commerce by independent producers of natural gas (gas). By order issued December 23, 1960, 24 FPC 1121, the Commission instituted the instant Permian Basin Area Rate proceeding. In that order the Commission defined the Permian Basin Area (Permian) as consisting of Texas Railroad Commission Districts No. 7–C and 8 and the New Mexico counties of Lea, Eddy and Chavez. The order named as Respondents those persons then having rate schedules on file with the Commission for the sale of Permian gas subject to its jurisdiction. The persons named therein are listed in Appendix E to this decision at page 407. The order of December 23, 1960, placed in issue the lawfulnes of the Permian rates of the Respondents so named, including the justness and reasonableness of such rates, and whether they were unduly discriminatory or preferential. There were also consolidated numerous pending proceedings involving suspended Permian rates and certain certificate applications of the Respondents.

Petitions to intervene were filed by some ninety parties of which forty-seven were granted and the rest denied. The petitioners and the disposition of their

requests are set forth in Appendix F. The Commission denied intervention to parties such as gas distributors which did not purchase gas produced in Permian. Among those denied intervention for this reason was the United Gas Improvement Company, a gas distributing company in Philadelphia, Pennsylvania.

A prehearing conference was held at Midland, Texas, beginning March 6, 1961.

In subsequent orders the Commission declared that cost of service studies of individual producers would not be received in evidence but that composite cost studies could be employed. *Cf.* orders dated April 5, 1961, 25 FPC 614, and May 14, 1962, 27 FPC 943.

A questionnaire regarding the operations of the Respondents was discussed and revised at several conferences among Staff and the parties to this proceeding. By orders dated August 2, 1961, 26 FPC 247, September 18, 1961, 26 FPC 514, September 25, 1961, 26 FPC 531, and January 11, 1962, 27 FPC 20, the Commission directed Respondents to reply to a revised questionnaire which consisted of three parts. Appendix A was directed to all Respondents and covered, in the main, drilling costs. Appendix B was directed to Respondents whose 1960 national company-wide jurisdictional sales were 10 million Mcf or more in the aggregate, and required the furnishing of data concerning national and Permian costs, revenues, and production volumes. Respondents whose company-wide jurisdictional sales were less than 10 million Mcf a year were given the option of supplying the data required by Appendix B or by Appendix C, a simplified version of Appendix B. The replies to these questionnaires were, in the main, received by the Staff by the spring of 1962. Staff tabulated the data so supplied and prepared composite data which it used as the basis for its major presentation in this proceeding.

In lieu of the disclosure of the individual producer reserve figures whose confidentiality the Respondents prize highly, Respondents agreed to submit an exhibit showing the estimated composite Permian reserves.

Since the composite cost of service type material could not be prepared until the Respondents had replied to the questionnaires, the first phase of the hearing was devoted to the presentation of economic and geological data, which were available. The hearing began on October 11, 1961, with the presentation of the economic case of various Respondents. In December 1961, the California Public Utilities Commission and the State of California (CPUC) and the California Distributor Interveners composed of the Pacific Gas & Electric Company, San Diego Gas and Electric Company, Pacific Lighting Gas Supply Company, Southern California Gas Company and Southern Counties Gas Company of California, (Distributors), presented economic evidence, and in May 1962 the Distributors made a further presentation of economic evidence.

The second phase of the hearing began in November 1962 with the submission by the Staff of the Federal Power Commission (Staff) of its cost case. Staff also submitted an econometric study in February 1963. In January and February 1963 various Respondents, Distributors and CPUC made further presentations based, in the main, on cost type evidence.

In the course of the second phase of the hearing the Presiding Examiner expressed concern that the subject of rate design was not being developed as fully and adequately as he thought desirable. In this situation, at the suggestion of the Staff, Mr. Charles H. Frazier, an official of the United Gas Improvement Company, but acting on his own behalf, offered, through Staff Counsel, to appear as an expert rate design witness to assist the Examiner in the solution of the problem, if the Examiner so requested. However, Mr. Frazier did not wish to appear on behalf of the Staff or of any party. Over the objection of certain Respondents, the Examiner permited Mr. Frazier to testify as the Examiner's witness and to present an exhibit on this subject. This witness was

fully cross-examined by those wishing to do so. This testimony stimulated other parties to submit rebuttal testimony and exhibits as alternative solutions, all of which were received in evidence.

The hearing was closed on September 12, 1963. On October 4, 1963, a briefing conference was held. Initial briefs were submitted on November 22, 1963, and reply briefs on January 15, 1964. The parties filing briefs are listed in Appendix G, page 417. Supplemental memoranda were filed thereafter by various parties in response to specific questions by the Examiner.

The numerous parties cooperated in procedures to facilitate the progress of the hearing. Various parties with common interests joined to submit a unified presentation. Thus the Distributors presented a single case and a joint brief. Sixty large producers combined to present a single case, with a few presenting additional evidence on matters of special interest to them. Twenty-two Respondents presented a joint brief, which was adopted by fifteen others. Some of the Respondents who relied on the joint brief also filed supplementary briefs limited to special points. Other Respondents filed briefs also confined to particular subjects. Warren Petroleum Company made a general presentation on Permian gasoline plant operations. Sun Oil Company participated on its own but avoided duplication. The small producers made a single presentation through the Texas Independent Producers & Royalty Owners Association and the West Central Texas Oil & Gas Association (TIPRO).

The attorneys for groups with respective common interests, *e.g.* Distributors and certain cities, Respondents large and small, pooled their efforts for cross-examination, different attorneys handling particular subjects, and in general, only a single attorney for each group cross-examining any one witness. Occasionally, when the interests of members of a group diverged or where the subject was extensive, there was cross-examination by several attorneys, but there was advance consultation and duplication was avoided. The coordination of the efforts of the large number of Respondents undoubtedly posed special problems, but it was accomplished with skill.

The attorneys engaged in substantial pretrial discovery, including conferences with opposing attorneys and witnesses to clarify exhibits and the extensive use of written interrogatories to prepare for and to shorten cross-examination. Work papers of witnesses were freely made available to interested parties, as were the compilations and machine runs of materials developed by Staff from the replies to the questionnaires. The attorneys are to be commended for their cooperation which materially assisted the trial of this proceeding.

The joint presentation by the group of Respondents referred to above and the joint brief presented by most of these Respondents seems to represent a consensus of the views of the Respondents. For convenience the term "Respondents" will often be used to refer to these two groups.

In general the position of the Respondent producers is: The national reserve-production ratio, the ratio of proved gas reserves to annual production, has fallen from 32.5 in 1946 to 19.9 in 1961 (18.7 in 1963). A ratio of 20 is the minimum level required to insure adequate supply. Present prices for gas, although arrived at after arm's-length negotiations, are insufficient to elicit the supplies needed to maintain this ratio. Respondents, in the main, support the directional hypothesis that gas reservoirs, as opposed to oil reservoirs, can be found by a search directed thereto. They contend that the trend in the cost of finding gas has risen substantially since World War II and that this increase is still continuing. Respondents also argue that, because of its joint cost nature, it is impossible to determine the cost of finding and producing gas, although they concede that the cost of finding and producing gas well gas can be estimated with a greater degree of reliability than the cost of oil well gas. On the basis of a consideration of the various economic and geological factors, Respondents' principal economic

witness, Dr. Foster, expressed the opinion that a single ceiling price of 20 cents per Mcf should be fixed in this proceeding.

TIPRO urges that prices be set between 17 cents and 21.8 cents per Mcf, with variations for physical or chemical qualities of the gas, if differing from pipeline quality. TIPRO also recommends that 13.5 cents be adopted as a minimum price, plus or minus quality differentials, and that all rates at that level be gradually raised by periodic escalation to the 17–21.5 cent level.

Distributors accept the directional hypothesis. They also concede that the cost of finding gas has increased materially during the postwar period, but they contend that the rise in the unit cost of finding gas has leveled off since 1958. Distributors advocate a two-price system: first a ceiling of 14.5 cents per Mcf for new gas well gas; second, a range of prices derived by adjusting existing gas contracts on the basis of an average price of 12 cents per Mcf and a ceiling price of 13.5 cents for residue gas and flowing gas well gas, and an average price of 9 cents per Mcf and a ceiling price of 10.5 cents for casinghead gas. Distributors make an independent determination of the cost of new gas well gas and of gasoline processing costs. Otherwise, they adopt Staff's "historical cost" basis for determining the price of flowing gas well gas, casinghead gas, and of the raw gas component of residue gas. Distributors deny that there is a shortage in gas supply. They contend that the Commission's reserve requirements for pipeline certification have been too high, artificially inflating the demand for uncommitted reserves; and that if these requirements be relaxed moderately, the present and future supply of gas will be sufficient to meet expected needs, and the cost of carrying gas inventory will be materially reduced.

Staff does not accept the directional hypothesis, and argues, that, in any event, gas supply is not significantly responsive to price. It also argues that finding costs for gas have not risen materially since the early 1950's. It proposes prices for gas based largely on a historical cost of service basis, derived, in the main, by applying the allocation methods used by the Commission in *Phillips* to the composite data of the Respondents contained in their replies to the questionnaire. In doing so, they arrive at fixed ceiling prices of 13.7 cents per Mcf for gas well and residue gas and 9 cents for casinghead gas. Staff also presents an econometric study whose thesis is that higher field prices for gas will tend to reduce consumer demand which will tend to reduce gas production, and in turn, exploration.

The CPUC proposes these price ceilings with this price structure: new gas well gas ceiling, 13.5 cents per Mcf; old gas well gas, average price, 11.95 cents per Mcf, with a ceiling of 13.5 cents; residue gas average price, 10.30 cents per Mcf, with a ceiling of 12 cents; casinghead gas, average price, 9 cents per Mcf, with a ceiling of 9.5 cents. The ceiling prices would be applicable only to pipeline quality gas, with lower prices for gas of lesser quality based on fixed differentials. It is intended that the application of these differentials produce average revenues equal to the average prices set forth above. CPUC's prices are based largely on Staff's "historical cost" studies. However, they present their own study of processing costs and of new gas well gas.

As an integral part of this decision, though placed in a separate section thereof and designated Appendices A, B, C and D, the Examiner has discussed the presentations of the several participants with respect to certain substantive issues.

The record contains much evidence relevant to the special institutions of this industry, which is necessary for an understanding and evaluation of the problems presented in this proceeding.[1]

---

[1] See *e.g.* the testimony of respondent witness, John F. Jones, and Exhibit 215, "Instruments in Common Usage in the Oil and Gas Industry."

I. The Economic and Institutional Factors Which Govern the Method of Establishing Area Rates

A. GENERAL CONSIDERATIONS

Natural gas presently supplies some 30 percent of the nation's energy requirements. Permian is one of the nation's major sources of gas. Though Permian supplies substantial amounts of the gas consumed in twelve states, physically, practically all of the gas sold in interstate commerce by independent producers in Permian flows westward to markets in California or smaller markets on the way.[2] The Distributors obtain more than 65 percent of their total natural gas supply from pipelines whose major source of supply is gas produced in Permian.

The production and sale of natural gas by independent producers is in many respects different from the operations performed by the typical regulated industry. The special economic and institutional factors affecting gas production must be considered to understand the problems presented; and any effective system of regulation must take into account these special circumstances. Some of these factors will be discussed in Part I of this decision; others will be considered later where appropriate. But the sum of these considerations is that regulation of this industry must be on the basis of its own unique characteristics. Techniques applicable to other industries cannot be rigidly applied to this industry.

B. JOINT PRODUCTION OF GAS AND LIQUIDS

Natural gas is produced to a considerable degree jointly[3] with liquids: with crude oil from oil casinghead reservoirs; with lease liquids from gas condensate reservoirs; and at natural gasoline plants, residue gas is a joint product with plant liquids. Even the gas from dry gas reservoirs is not produced entirely independently, as the search for oil and gas is still partly joint despite the industry's ability to direct its search between gas and oil in many areas. The joint production and joint nature of many of the finding and production costs of oil and gas are the source of many of the difficulties in the Commission's task of regulating the price of gas sold in interstate commerce.

The Commission does not have jurisdiction over the charges for the joint product liquids, which constitute in terms of value over 80 percent of the revenues of the oil and gas production industry. The Commission is thus in the position of regulating the price of a minor product of a substantially joint operation. The increasing development of directional finding, which will be discussed below, should ameliorate this aspect of the problem.

State prorationing regulations, reinforced by federal prohibition of interstate oil shipments in violation thereof, set standards for conservation practices for oil and gas production. Prorationing affects the supply and thus the price of gas. State regulations influence the rate of take from oil and gas reservoirs; and by restricting oil production to expected demand they affect the rate of production of oil well gas, the major gas produced in Permian. Thus in an economic sense the Federal Power Commission shares its pricing authority over interstate gas with the State commissions.

Although similar in many respects to other petroleum hydrocarbons, the gaseous nature of natural gas makes it much less valuable than liquid hydrocarbons with an equivalent energy value. From wellhead to burner tip it must be connected by an umbilical cord of pipes. For this reason it cannot be used efficiently

[2] The other states are supplied via exchange between El Paso Natural Gas Company and Northern Natural Gas Company.

[3] Products are produced jointly when they are produced together and when their respective output cannot be significantly varied.

as fuel for motor vehicles or for engines separated from a pipeline; and as a consequence, a Btu of crude oil or lease condensate is worth some 4 to 6 times the value of a Btu of gas, and a Btu of natural gas liquids some 3 times the value of a Btu of natural gas.

C. THE RISE IN THE NATIONAL PRICE OF NATURAL GAS

A significant economic factor has been the rise in the price of natural gas between 1945 and 1960.

Prior to 1945 natural gas had a low economic value. Its price averaged below 4 cents per Mcf. Vast amounts were flared from oil wells and from natural gasoline plants for lack of a market. Gas reservoirs found in the course of a search for oil were shut in.

Between 1947 and 1960 the average price paid by pipelines for gas trebled, from 4.95 cents to 15.61 cents. Even after adjusting for changes in the purchasing power of the dollar, prices in 1960 were some 2.3 times their 1947 level.

The record does not show comparable data for Permian, but the following gives some indication of the price trend. In 1945 El Paso purchased one-stage sour undehydrated residue gas at 5 cents per Mcf. By 1953 it was paying 7 cents; by 1958, 8 cents; and by 1960, 13.5 cents per Mcf for this gas. El Paso's purchase prices for three-stage sweet residue gas were: 1953, 10 cents; 1958, 11 cents; 1960, 17 cents. In 1959 Transwestern entered into contracts for three-stage sweet residue gas at an initial base price of 21.8 cents per Mcf.[4]

D. THE POST WAR INCREASE IN DEMAND

1. The Development of the Large Diameter Pipeline

The development of the large diameter high pressure pipeline during and after the war made it possible to transport to distant points the large amounts of gas which were already available or were being discovered primarily in connection with the search for oil. Vast networks of interstate pipelines increased the demand for gas by making it available to new markets. The average annual increase in net production between 1946–51 was 10 percent, and between 1951–56, 6.5 percent. The rate of increase slackened to an average annual increase of 4.3 percent for 1956–61. No party argues that the rate of growth will exceed Respondent witness Clark's estimate of a 3.5 percent annual increase through 1970.

2. Permian Pipeline History

About 50 percent of Permian production is consumed intrastate: in field use, local utilities and industries, and in the manufacture of carbon black. The other 50 percent is sold to three interstate pipelines. These interstate shipments are divided:

Name	*Percent total 1961*
El Paso Natural Gas Company (El Paso)	73
Northern Natural Gas Company (Northern)	18
Transwestern Pipeline Company (Transwestern)	9

El Paso began purchasing Permian gas in 1945 for interstate transmission in connection with its construction of the first pipeline from Texas to California. Although it was the sole interstate purchaser until 1954, El Paso's buying price increased several times during this period, but not to the extent it did later when it was faced with the competitive buying of other pipelines.

[4] The Commission, in certificating Transwestern, conditioned the initial prices to some 18 cents, the producer thereafter being legally able to file schedules for increases up to the contract prices, subject to suspension by the Commission.

Northern was certificated to buy in Permian in 1954. Permian Basin Pipeline Company and West Texas Gathering Company began purchasing in Permian in 1957, and prices advanced considerably during this period. Transwestern began its Permian purchases in 1958, and after its certification built the second pipeline from the Southwest to California. During the period of Transwestern's purchases the price of Permian gas rose substantially.

Under the two-party most favored nation clauses then in effect in most of El Paso's contracts, if El Paso had met Transwestern's competition in any one county in Permian, it would have affected all its existing Permian contracts, which in turn would have affected all its new contracts in any other county in Permian. Under the thrust of a threatened even greater increase in price due to favored nation clause operation, El Paso renegotiated almost all its Permian prices beginning in October 1959 and extending into 1960. Under this renegotiation, El Paso's purchasing prices were raised substantially and across the board. In return, the most favored nation clauses were replaced with a periodic increase of one cent every five years.

3. Commission Certification, Required Reserves, and the Position of the Pipeline Buyer

The buying position of the pipeline purchasers has been affected by these factors: The Commission for many years required pipelines seeking certification for new lines or extensions of old lines to show that they had under contract proved gas reserves amounting to approximately a 20-year supply for their jurisdictional sales over their entire system.[5] Since certification is a valuable privilege with a high market value, since pipelines are permitted to incorporate into their cost of service the price they pay for gas, and since the delivered prices for gas were not causing serious competitive problems with other fuels during the 1950's, pipelines vying for certification and seeking to sew up large blocks of uncommitted reserves necessary for this purpose were less sensitive to price considerations than they would have been under other circumstances. Also, it is reasonable to infer that Transwestern's bargaining and its attitude regarding the prices it was agreeing to pay for Permian gas in 1958 and 1959 were in some degree affected by these factors: 16 percent of Transwestern's stock was owned by Respondent Monterey Oil Company;[6] some 32 percent of Transwestern's stock was owned by Respondent Warren Petroleum Company (Warren), a subsidiary of Respondent Gulf Oil Corporation; Warren is the largest seller of three-stage residue gas in Permian.

More recently, as the Examiner's witness Frazier pointed out, the bargaining attitudes of pipelines have been changing. There is presently intense competition between pipelines for the limited growth in city-gate demand. And now that the city-gate price has advanced materially and distributors' costs have increased, competitive price pressures in the ultimate market have resulted in an added cost consciousness on the part of pipelines.

4. Relatively Inelastic Consumer Demand

Once residential and commercial consumers have installed gas using equipment, they are to a considerable degree locked in; their demand for gas tends to be fixed regardless of price *i.e.*, relatively inelastic. The demand of industrial consumers is generally more elastic because they usually have alternative sources of supply. However, in Los Angeles County, where a great amount of Permian

[5] The technical and economic considerations regarding the deliverability rule and its translation into required reserves will be discussed in the next section, E.

[6] In December 1960 Monterey's assets were sold to Humble Oil & Refining Company, but its interest in Transwestern was sold separately, apparently to Northern.

gas is consumed, natural gas is now virtually required throughout the entire year as a result of additional restrictions on the industrial use of fuel oil imposed in January 1964 to alleviate the smog situation. Also in California as a whole, industrial demand for gas is less elastic than in other areas of the country.

E. GAS SUPPLY: REQUIRED INVENTORY

The bulk of future supplies of gas, like oil, will come from future discoveries, from the results of the finding and development effort that will occur in the future. The reserves known today constitute the industry's current inventory. They serve as a base for new pipelines, as a cushion for the expansion of existing lines, and as a reserve tank to offset fluctuations in new findings. They are not a substitute for future production. If no reserves were to be found in the future, the industry would have to close down; and the size of existing reserves would merely determine the time when this would occur. As Messrs. Lyon Terry and John Winger, sometime vice-presidents of the Chase Manhattan Bank, have explained, "The proved reserves comprise only a small part of the total future supply—the more important part is that which is to be discovered in the future." *Future Growth of the Natural Gas Industry*, 1957, p. 15, published by The Chase Manhattan Bank. (66/7158–59.) The National Petroleum Council, the Oil Industry Committee set up officially to advise the Department of Interior, explains the significance of reserves for the oil industry in the following quotation, which is equally applicable to gas:

> Future supplies are not determined by the reserves known today . . . . A common mistake made in discussing future oil supplies is to consider only proved reserves. Frequently these proved reserves are compared with the current annual production to arrive at the number of years that supplies will last. By such calculation it would have seemed almost any time in the past that supplies could last only ten to twenty years. On this basis there have been many predictions that we are running out of oil. Such predictions have been false in the past. They are nonsense today because they fail to consider the rate of oil finding and development. It is future discoveries, not presently known reserves, that will determine available supplies for the long run. [Report of January 29, 1952, presented by Committee on Oil and Gas Availability to the National Petroleum Council, pages 40–41.] (66/7160–61.)

There are several measures of the adequacy of the industry's gas inventory. First, there is the Commission's deliverability rule. In the past, in certificating extensions by interstate pipeline companies, the Commission has in general required them to demonstrate that the volume of reserves which they control, whether by ownership or by contract, will be sufficient to maintain approximately 12 years' full deliverability of the total augmented volume of sales. Because deliverability declines after a certain number of years, the 12-year deliverability standard requires that a pipeline maintain committed reserves equal to some 20 times its annual sales. This requirement applies over the entire system of a pipeline even though it seeks certification of increased sales over only a part of its system, or even if it seeks only a minor extension. The original reasons for the rule were undoubtedly that in the early stages of a new, uncertain, and rapidly expanding industry the Commission felt it necessary to assure consumers who had purchased equipment that there would be adequate supplies; also a Commission certification of committed reserves of this magnitude would it was hoped, give assurance to investors in pipeline securities, reducing the cost of capital.

A second measure of the adequacy of the inventory is the pipeline life index, the ratio of the proved reserves owned or under contract by interstate pipelines

to their annual sales. A third measure is the national life index, the ratio of national year end proved reserves to annual production, or the R/P ratio. The pipeline life index can be lower than the national life index because there may be reserves which are not under contract to pipelines, and because intrastate pipelines may have a lower life index than interstate pipelines.

There is a further factor to be considered, the 20-year contract institution under which gas is typically sold. The 20-year contract implies an average rate of take from the reservoir of approximately one-twentieth each year. The 20-year contract has nothing to do with either the R/P ratio or the pipeline life index. It so happens that in recent years the R/P ratio has been approximately 20, and the Commission's deliverability requirement can be roughly translated into a 20-year pipeline life index. But it is perfectly possible to have 20-year contracts with a life index lower than 20 years. This can occur if the contracts are of different ages and the reserves are at different stages of exhaustion. Thus a 17.5 R/P ratio is consistent with the 20-year contract institution.

The maintenance of a 20-year inventory involves three consequences which should be considered in determining the necessity for maintaining this standard.

1. It inflates the demand by pipelines for new sources of gas and concomitantly reduces the immediately available supply, thus tending to raise the price for the supplies of uncommitted gas. For example, Transwestern's efforts to secure the contracts for a 20-year supply to obtain certification were a major factor in the rise in Permian gas prices during the period 1958–1959.

2. Carrying proved reserves for a period of 20 years is expensive. It locks up capital, the cost of which must be included in the price of the gas and thus ultimately be borne by the consumer. In Respondent witness Cram's model, the maintenance of a 20-year inventory of gas compared with a 17-year inventory increases the cost from 14 to 23 cents per Mcf. In Distributor witness Roseman's exhibit gas supply is carried for the 20-year contract period and a return allowed over this entire period. However allowing the national R/P index to decline from 20 to 17.5 by 1970 reduces his cost of new gas well gas almost a cent per Mcf. In Respondent witness Park's model, a reduction from a 20-year inventory to 17.5 reduces the cost per Mcf by over 2 cents per Mcf.

3. Under current purchasing and marketing conditions, and in the absence of a rapid rate of market growth, maintenance of a 12-year deliverability and a 20-year life index will tend to produce a serious situation of oversupply. This is evidenced in part by the take-or-pay situation of many pipelines, where they cannot currently absorb their contracted for deliveries. The testimony of Distributor witness Professor Kahn on this subject is persuasive. Intervener witness Grimm, manager of the gas supply department of Northern, and for 10 years assistant manager of Phillips' Reservoir Division, presented a study of this problem which merits careful consideration. It is not necessary to agree with all the details or assumptions in his study to accept the general thesis that, with the levelling off of the rate of increase in demand in recent years, constant maintenance of 12 years of deliverability (and 20 years of reserves) will lead to a considerable oversupply of gas and to unnecessary additional costs to carry this surplus. Grimm presented testimony to this same effect in another proceeding, *Northern Natural Gas Company, et al.*, 30 FPC 859 (1963). In its opinion in this case the Commission stated that Northern had showed "that if it is required to maintain 12 years of full line load at all times, it will accumulate excess supplies and will incur additional costs associated with maintaining an unneeded supply." (At p. 862). *Cf.* Order No. 279, 31 FPC 750, March 31, 1964.

Other witnesses for the three pipelines involved in this proceeding testified that the Commission's 12-year deliverability rule should be relaxed and that this

would benefit them. It would not result in a higher cost of money, nor would it trigger the acceleration clauses in their indentures. The requirements in the bond indentures of the several pipelines regarding maintenance of reserves are lower than the requirements imposed by the Commission, since, among other reasons, the indentures generally permit the inclusion of reserves which are reasonably expected to become available; and in some instances, for example Transwestern's, although there is an additional requirement for committed gas, the amount is lower than required under the Commission's rule. In arguing for the relaxation of the Commission's rule, it is clear that the pipelines desire to maintain lower reserves than are required under the Commission's existing rule; for if they intended to adhere to the same reserve levels, a change in the Commission's rule would be of negligible significance to them.

Referring to data published by the American Gas Association and the American Petroleum Institute respecting the reserve life index of oil reserves and gas reserves, Grimm testified:

> * * * Data published by these organizations indicate that the unregulated oil industry has maintained a reserve-life index which has varied between 11½ to 13½ years during the period from 1946 to 1961. The latest figure for 1961 is 12.1 years.
>
> In contrast to the history of the reserve-life index for the oil industry, the gas industry started with a high reserve-life index and has shown a declining index throughout the period with the exception of the year 1958. In 1946 the gas reserve-life index stood at 32½ years, whereas for 1960 and 1961 it was approximately 20 years. This is probably a healthy trend for it reflects a reduction in a superabundant gas supply, together with a smaller capital investment and lower unit cost than otherwise would be required. There is no practical reason why this index should not be permitted to decline to the 12- to 13-year ratio comparable to the oil industry. It is believed that it would stabilize at approximately this level if there were no pressure on the part of the regulatory authorities. The equivalent full-line-load life of gas supply with a 13-year reserve-life index is eight to nine years. (144/15,515.)

Messrs. Terry and Winger in their article *Future Growth of the Natural Gas Industry* state:

> Ten years ago reserves were 32.5 times annual production. As the gas business continues to expand, this ratio will no doubt continue to decline moderately. But a further decrease in the reserves-to-production ratio even below 20 should not be alarming so long as additions to reserves substantially exceed production. The proved reserves comprise only a small part of the total future supply—the more important part is that which is to be discovered in the future. [*Op. cit.* p. 15.] (66/7158.)

This view was adopted and quoted in part by Professor Kahn in his testimony on this subject in this proceeding.

The American Gas Association stated in its publication *Gas Facts*, 1957 edition, p. 6, with respect to the reserve production ratio:

> As long as new additions exceed production there need be little cause for concern about such an hypothetical ratio. (66/7159.)

The Distributors in this proceeding urge the Commission to accept an R/P ratio of 17.5 by 1970. This would be accomplished by relaxing the deliverability rule and permitting a slow drift downward to a 17.5 R/P ratio by 1970. The Staff argues that a 15-year R/P ratio with a 10-year deliverability index gives ample lead time to secure additional reserves if it is demonstrated in the future that greater reserves are needed.

It should be noted that the AGA's definition of proved reserves is conservative, and that a 15-year inventory of proved reserves indicates that probable reserves are greater.

Respondents, on the other hand, contend that a reduction in the reserve requirement would lead to "chaos" in the producing and pipeline industries. But aside from the matters discussed above, their arguments are insubstantial and unpersuasive, and are based in part on a failure to distinguish between the national R/P ratio, which relates reserves remaining at the end of a given year with the production in that year, and the rate of take under the 20-year contract which is based on the original reserves underlying the contracts. The two ratios need not coincide.

On the issue how much inventory is needed, the opinions of the purchasers, the pipelines and the distributors are more significant than those of the producers. The producers have an obvious interest in maintaining the required inventory at a high level. While the distributors and the pipelines will benefit from the lower costs of gas which a lightening of the inventory load will make possible, their views are also tempered by the need to protect their own enormous investments in gas facilities.

It is concluded that a 17.5 year R/P index in 1970 represents a satisfactory level for gas inventory and that this should be achieved by the Commission's relaxing its present reserve requirements. A decline in the R/P index to 17.5 by 1970 will be reflected in the requirement for growth in the cost determination for gas. If this is done, then some time prior to 1970 the Commission will have to decide whether to let the index continue to decline to an even lower level, maintain it at 17.5, or raise it. If it decides to maintain (or raise) the reserve level, the Commission will then have to increase the allowance for growth in cost and price levels. A 17.5-year reserve should afford adequate lead time to permit changes, if these prove necessary.

F. RECENT TRENDS IN GAS INVENTORY

Recent trends in gas supply are significant. The core of Respondents' case is that gas prices are so low that adequate supplies are not being found. This is coupled with an insistence that the R/P ratio must be maintained at 20 as a minimum.

Discoveries of gas additions in recent years have been substantially above current production. Discoveries consist of "new discoveries" and "extensions and revisions." The latter consist of revisions of findings in earlier years; on balance they generally amount to about twice the new discoveries. New discoveries provide a better picture of trends than total discoveries, because the data in the latter are often distorted by negative revisions which are concealed in the totals. For example, if it is found in 1958 that the 1954 reported findings for a reservoir were too large, the reduction is made in the 1958 findings, while the 1954 findings are not changed. Consequently, a negative revision will tilt a trend for a recent period downward for two reasons: the reported figure for the earlier year is not changed, even though it now appears that it was too large; while the later result is reduced, even though the reported figure for this period is regarded as correct. Negative revisions in some years are substantial; and a net positive figure for extensions and revisions may be lower than otherwise because additions have been partially offset by negative revisions. Thus the unusually low findings reported for 1960 were in part due to "tremendous" downward revisions in estimates made in earlier years by El Paso, particularly in the San Juan field. For this reason total findings are not an entirely reliable indicator of finding trends. This is indicated by the following recent results in Permian:

	New Discoveries MMcf	*Extensions and Revisions—MMcf*	*Total Findings MMcf*
1959	278, 523	1, 080, 311	1, 358, 834
1960	383, 531	661, 555	1, 045, 086
1961	405, 306	(16, 485)	388, 821

Here it is evident that new discoveries have been increasing while net extensions and revisions have been declining; in 1961 there was a net negative figure for extensions and revisions, indicating that negative revisions exceeded positive extensions and revisions for this year. The results for the total additions indicate a declining trend. More careful analysis suggests the contrary; earlier Permian findings were in fact lower than reported, and recent findings have been larger than indicated by the total findings. This is confirmed by the results for new discoveries the trend for which has been upward.

The table on page 319 shows the annual total year end reserves, annual procoveries, total findings, production, the ratio of new discoveries to production, and the ratio of total findings to production.

It is evident that the results vary considerably from year to year. But findings have continued to exceed production by a substantial amount; and while the trend of the findings to production ratio has been downward, the rate of decline has been decreasing. The 1961 and 1962 figures show a rise while the 1963 figure declines due to a fall in 1963 findings.

The table on page 319 shows the annual total year end reserves, annual production and the reserve production ratios. The national R/P ratio declined rapidly from 32.5 in 1946 to 23 in 1952, slowly thereafter to 21 in 1959, averaged about 20 for 1960, 1961 and 1962, and fell to 18.7 in 1963. The results are in part a function of the rate of total findings which vary erratically, so that the results of a single year have to be considered in the perspective of other years. The R/P ratio was high in the past when gas reserves were discovered, willy-nilly, as a by-product in a search for oil and the market for gas was limited by lack of transportation facilities. With the postwar expansion of interstate pipelines and the growth in consumer demand, the national R/P index declined. However, the rate of growth in demand has decreased from 10 percent annually during the period 1946–51, to 1.9 percent in 1961–62. At the same time the average annual rate of decline in the national R/P ratio was 5 percent for the period 1946–53, and only 1.6 percent for the years 1954–61, inclusive; from 1960–62 the R/P ratio was virtually constant at 20, falling to 18.7 in 1963. The decline in the national R/P ratio is a natural and expected result of the maturing of the gas industry.

Respondent witness Cram fits a "least-squares" trend line to the data for the period 1946–1960. Exhibit 1, Chart 5, Panel A. His trend line shows a definite continuous downward trend from the beginning to the end of the period, because the least squares method distributes the total change evenly over the entire period. The trend line suggests a further decline at the same rate if projected into the future. Yet visual inspection of the actual R/P ratios in the table on page 319 indicates that the rate of decline has been slowing up in recent years. The least squares trending method by its mechanical nature does not reveal a change in trend, and thereby distorts the results where a change occurs during an intermediate stage of a series.

Similar criticisms apply to the trend in the reserves added (findings) to production ratio shown in Cram's Exhibit 1, Chart 5, Panel B. Here the 1946 findings figure is unusually high, and the 1960 figure is low. The "least-squares" trend line is tilted downward by the height of the 1946 ratio and the depth of the 1960 ratio. That the downward trend line is questionable is indicated by the fact that the majority of observations for the first seven years are below

New discoveries and total findings of natural gas: Ratios to production, United States, 1947–63 (14.65 psia)

Year	New discoveries	Total findings	Net production during year	Ratio of new discoveries to production	Ratio of total findings to production
	Million cubic feet			(1)÷(3)	(2)÷(3)
	(1)	(2)	(3)	(4)	(5)
1947	3,410,170	10,980,824	5,629,811	0.606	1.95

the trend line, and the majority of observations for the most recent five years above the trend line. The trend lines in these exhibits show a continuous average decline in the ratio of reserves added to production and in the ratio of reserves on hand to production over the entire period 1946–1960. Similarly comparisons between the 1946 or 1947 figures and the 1960 or later figures which are made by

Respondents suggest that the decline in new supplies and reserves on hand to production will continue at the same average rate unless drastic increases in prices are made. But analysis of the figures and consideration of the factors behind them indicates that in recent years the rates of decline have been leveling off; and that the results have been what one would expect, where at the beginning of a period there was a large supply of shut-in reserves found as a by-product in a search for oil, a sharp increase in demand in the early part of the period, with a decline in the rate of this growth at the end. The results for recent years indicate that findings have been exceeding production despite the increase in production, and that, on the whole, the downward trend in recent years has been slight.

G. THE NATURE OF THE SUPPLY OF GAS

1. The Lag Between Investment in Gas Reserves and the Receipt of Income from the Flow of Gas

A significant supply characteristic of the gas finding industry is the length of time that elapses between the investment in finding gas and the receipt of revenues by the producer from the flow of that gas. Various producer witnesses have referred to a period of from 3 to 4 years as representing the time lag between the initiation of exploratory efforts and the commencement of sales, with the lag being as long as 15 years in some instances.

Pipelines typically buy gas under 20-year contracts, so a further period elapses until delivery of the gas is completed.

Gas wells generally take longer to deplete than oil wells. However, the prorationing rules that have been in effect in recent years in Texas and New Mexico have substantially lengthened the production period for oil well gas.

The consequence of this long production and delivery cycle is that most of the gas flowing today was found a considerable number of years earlier. In considering a specific unit of gas that is currently flowing, current outlays represent a small portion of the total outlays expended over time to produce this gas. A large proportion of the total outlays were incurred at some prior time to find the gas, with current operating expenses representing a small percentage of the total.

2. The Rise in the Dollar Cost Per Mcf of Finding Gas Between 1947 and 1960

Another relevant feature of recent gas production is the trend in the dollar cost of finding gas during the period 1947–60. Respondents list many factors which affect the cost of finding gas and show their cost trend, labor costs, the average depth of wells, the amount of gas recovered per foot, etc. The most significant index which reflects a variety of factors as well as changes in productivity is the drilling and equipping cost per Mcf of new gas additions during the period 1947–60. Two estimates, one by Dr. Foster for the Respondents and one by Dr. Joskow for the Distributors, have been presented. The results of these two estimates are shown in the table on page 321. It is unnecessary for the purpose of this discussion to decide which of the two indices is sounder because it is evident that, no matter which index one uses, the dollar cost of finding gas rose substantially between 1947–60. Dr. Foster's results show an increase of 88 percent over the period; Dr. Joskow's results show that 1960 costs exceeded those for 1947 by 61 percent, with the peak difference some years earlier than 1960.

Staff concedes that finding costs rose substantially during the years immediately following 1947. However, it argues that these "costs have not risen since the early 1950's," apparently since 1952 or 1953. (Brief p. 487.) Staff relies on the testimony and exhibits of several witnesses but the data do not sustain its thesis.

Indices of drilling and equipping cost per Mcf of natural gas reserves added—U.S. continental (1947–49=100)

	Foster [1]	Joskow [2]
1947	95.0	101.8
1948	100.8	100.2
1949	104.3	98.0
1950	108.7	102.6
1951	116.7	113.6
1952	124.9	114.1
1953	132.4	145.7
1954	139.7	154.5
1955	147.2	173.2
1956	156.6	159.2
1957	169.4	147.5
1958	174.3	140.7
1959	182.9	147.4
1960	187.6	160.6

[1] Exhibit 26, Sch. 37.
[2] California Distributor Intervenors' Response to Examiner's April 22, 1964 Request for Information Attachment; based on Exhibit 116, schedule 8, page 2.

Staff first cites the index of Distributor witness Joskow, which has just been referred to. This index was presented to show a long term trend. It uses moving averages of gas reserve additions which obscure the time when a change occurs. It is not cogent for the purpose for which Staff here relies on it and, in any event, it shows high points in cost per Mcf in 1955, 1956 and 1960.

The data of the other witnesses on which Staff relies are shown in the table below. Staff witness Loring's data on the drilling costs of the Appendix A respondents converted to an index show that drilling costs for gas well gas rose between 1955 and 1958, declining thereafter, but with 1960 higher than 1955. Staff witness Wein's data on the annual cost per foot of exploratory gas and gas condensate wells of the Appendix A respondents show a rise in costs until 1958, followed by a decline and a subsequent slight rise. Respondent witness Cram's annual cost per Btu shows peaks in 1954, 1957, and 1960 with dips in between.

Staff's selected indicators of recent cost trends

	Loring-Roseman gas and gas condensate wells cost/foot—total [1] (1958=100)	Loring-Wein gas and gas condensate wells cost/foot—exploratory [2]	Cram-Morton finding and developing expenditures per million btu's of reserves added [3]
1952			10.9¢
1953			9.2
1954			15.9
1955	88.3	$31.22	11.2
1956	94.8	30.83	10.9
1957	104.9	32.71	14.4
1958	100.0	29.80	11.0
1959	93.9	28.21	9.5
1960	94.2	30.26	13.5

[1] Exhibit 224, Sch. 3 (based on Exhibit 165, p. 44B).
[2] Exhibit 166, p. 22 (based on Exhibit 165).
[3] Exhibit 1, Sch. 3 as modified by Exhibit 220, Sch. 8.

Staff also compares the costs shown in CPUC witness Doran's cost of Permian gas well gas for 1960 with its own historical cost for such gas. This comparison is not significant for determining the year in which cost increases may have ceased.

Even if the exhibits and data on which Staff relies be accepted as valid for this purpose, they indicate generally a pattern of rising costs from 1953 to about 1958 with a decline thereafter until 1960. A description of this pattern as show-

ing simply that "costs have not risen since the early 1950's" obscures the significant fact that the data indicate a rise until about 1958.

In other sentences in its brief Staff seems to be arguing only that the unit costs of finding have shown "no upward trend" over the period 1953–60, or 1956–60. This is somewhat different than the conclusion that "costs have not risen since the early 1950's." It is important to make this distinction because the failure to do so obscures and reduces the period during which costs rose as well as the level to which they did rise. The first and last years of a series may be at the same level; but the events in between are also significant.

The second significant factor that has to be considered is therefore that finding costs for gas rose substantially between 1947 and 1960. This rise continued at least until 1958.

3. The Elasticity of Supply of Oil Well Gas

It will facilitate analysis if the terms "oil well gas" and "gas well gas" be defined as used herein. Oil well gas is gas produced from oil reservoirs. It is the same as casinghead gas, and includes associated and dissolved gas. Most Permian oil well gas is processed at natural gasoline plants; it is then included in the term "residue gas." In Permian 70 percent of production in recent years has been oil well gas. However, for the country as a whole, oil well gas constitutes only some 30 percent of total recent production.

Gas well gas is gas from gas reservoirs. It covers non-associated gas, gas from dry gas reservoirs and gas condensate reservoirs, and gas from gas cap wells.[7]

The discovery and production of oil well gas has been and will probably continue to be dependent on and controlled by the discovery and production of oil. There are two major reasons for this.

(a) Oil well gas is in joint supply with oil. It is physically found and produced jointly and inseparably from oil. The producer cannot direct his search toward either product separately from the other; the search is nondirectional. Also the production of oil well gas is governed largely by conservation practices established to encourage the maximum efficient recovery of oil.

(b) The value of oil well gas averages only some 1/17th the value of the products (oil and gas) of the oil reservoirs.

Because of these factors, joint supply and the low value of the oil well gas compared to the other joint product, oil, the price of gas has only a slight affect on the supply of oil well gas. The supply of oil well gas is governed by the supply and production of oil, just as the supply of sawdust is governed by the supply and production of wood, and not by the price of sawdust. It would take an extreme increase in the price of gas to affect significantly the supply of oil and oil well gas, an increase so large that it probably could not be carried out.

This does not mean that the price of oil well gas has no effect on the supply of oil well gas. In a marginal decision to drill for oil the price for oil well gas may have some influence. The price of the gas may also have some effect on a decision regarding the drilling of an existing oil well to a greater depth, or on the decision at what point an oil well is to be abandoned. Also the revenue from oil well gas becomes part of the total revenues of the producer and thus can be used to finance further search for gas, oil, or for any other purpose. But these factors exert only a minor influence on the supply of gas; hence the price

[7] Gas cap gas, gas from an oil well that can be produced free of the influence of oil production, is a special case. It is not found separately from oil; but it can be produced separately from oil and is not governed by the prorationing rules that affect the production of oil well gas. The statistics for gas well gas generally include production from gas cap wells and the definitions of the state regulatory commissions generally include gas cap wells in the gas well or non-associated gas classification. As a practical matter, it is expedient to include gas cap gas in the category of gas well gas.

of oil well gas will not significantly affect the supply of oil well gas. As Respondent witness Dr. Foster states:

> * * * An increase in gas prices would have no significant effect on oil drilling. * * * Well, I don't think price of gas is of sufficient incentive to drill for oil that there is much of a problem. * * * In general terms I would say that increase in gas prices would have a relatively minor effect on new supplies of gas from oil wells. (43/4,785, 4,786, 4,787.)

In technical economic terms, the supply of oil well gas is extremely "inelastic." The terms "elastic" and "inelastic" have been used by various parties with different meanings, resulting in some confusion. Thus Respondent witness Dr. Foster concludes that the supply of gas has been "elastic" and "relatively elastic" while Distributor witness Professor Kahn finds that "* * * there is no doubt at all that the supply of gas has been, at least until quite recently, markedly inelastic * * *" (1/494, 40/4542, 4553–4; 66/7102). The difference lies largely in the meanings they give the terms. Professor Kahn and Distributors use the terms elastic and inelastic in their technical sense, while Dr. Foster and Respondents use the terms to denote any degree of responsiveness of supply to price, or any significant degree of responsiveness. Elasticity of supply is a technical economic term expressing a specific relationship between changes in the price of a commodity and changes in the supply of that commodity. If a price increases 10 percent and the supply of that commodity also increases 10 percent, the supply is said to be price elastic, or to have unit price elasticity—that is, a one for one proportional change in both price and supply. A more than proportional increase is termed relative elasticity and a less than proportional increase relative inelasticity, *e.g.*, if the price increases 10 percent and the supply increases only 5 percent, the supply is relatively price inelastic. If the supply increases zero in the face of a price increase, the supply is termed "perfectly inelastic." To insure precision, further references to elasticity will use the term in its technical meaning.

It is evident that the supply of oil well gas is almost perfectly inelastic. Its supply is determined by oil supply and only to a negligible degree by the price of gas. In this situation, the price for gas will not be an effective instrument in eliciting the supply of oil well gas.

4. The Supply of Gas Well Gas, Directionality, and Elasticity

For the country as a whole, gas well gas constitutes the major source of present and future production. Gas reserves are an important aspect of gas supply and a considerable inventory of gas is required by the economics of the gas business. The percentage of gas well gas to total gas both with respect to production and reserves added has increased substantially during the period 1947–60. In 1960 gas well gas production constituted about 72 percent of gross gas production, an increase from some 64 percent in 1948. Proved reserves as of the year ending 1960 were 71 percent gas well gas and 29 percent oil well gas.

The statistics for gas reserve additions do not furnish a breakdown between gas well gas and oil well gas as such. The record contains two estimates of these respective annual reserve additions, Dr. Foster's and Dr. Joskow's, which are shown on page 324. Dr. Foster's method shows that gas well gas additions have grown from some 62 percent of total gas reserve additions in the period 1947–1949 to some 76 percent for the period 1958–60. Dr. Joskow's method shows that gas well gas has grown from 55 percent of the total to some 82 percent during the corresponding periods.

The situation in Permian differs from that of the country as a whole. In 1960, 30 percent of total Permian gas production consisted of gas well gas and some 70 percent of oil well gas.

Trends in U.S. continental gas well gas reserves added and gross production—1947–62

Gas well gas reserves added—million Mcf

Year	Total findings [1]	Gas well Gas [2]		Percent gas well gas	
		(Foster)	(Joskow)	(Foster)	(Joskow)
1947	10,981	7,284	6,463	66	59
1948	13,898	8,206	7,485	59	54

As noted above, during the period between the two World Wars, the price of gas well gas, like that of oil well gas, was extremely low, 1–4 cents per Mcf, because in most areas the gas could not be transported to the market on an economic basis. Producers hoped to find oil, but except in a few areas they were unable to direct their search between oil and gas reservoirs. Thus gas reservoirs were found largely as a joint and unwanted product, incidental to the search for oil. Many gas wells were shut in during this period, though producers sold whatever they could as long as the price exceeded the slight incremental cost of producing the gas, rather than sitting on it. The supply of gas well gas was relatively inelastic during this period, though not quite so inelastic as that for oil well gas, since it could be shut in for lack of a market.

So long as gas is purely a joint product with oil, *i.e.*, if no part of it can be found separately or directionally, its supply is likely to be relatively inelastic. At current prices, nationwide gas revenues (from both oil well gas and gas well gas) constitute only some 20 percent of the combined revenues from oil and gas. If gas supply is entirely joint with oil an increase of 20 percent in gas price will tend to produce an increase in this gas supply of some 4 percent. Such a supply

elasticity, 0.2, is extremely low, though not as low as the supply inelasticity of oil well gas.

But the problem of elasticity is a matter of degree; it is a quantitative problem. The supply of a product may be "relatively inelastic" in the technical sense, while its response to price may still be sufficiently great that the price for it can have a substantial effect on its supply. In this situation price can be a reasonably effective tool in eliciting supply.

Given the present range of economic prices for gas and oil the supply of gas can become elastic or achieve the lesser stage of being substantially responsive to price only if it can be found and produced to a considerable degree independently of oil. Directionality in the search for gas is thus a prerequisite to either supply elasticity or substantial responsiveness of gas supply to price. And so also is directionality prerequisite to the use of price as a tool in eliciting supply. The existence of directionality will not insure elasticity or responsiveness in supply; other factors may also affect the result. But a significant degree of directionality is a prerequisite to that degree of responsiveness which will permit the use of price as a tool in determining the economic behavior of supply.

It is obvious that directionality or the separate search for gas can apply only with respect to gas well gas. For physical reasons the search for and production of oil well gas must remain joint.

a. Directionality in the Search for Gas Well Gas.—The evidence in this proceeding indicates that sometime during the 1950's producers became able to direct their search to a considerable degree toward the discovery of either gas reservoirs or oil reservoirs. It is probable that this directional capacity was being increasingly developed during the early 1950's but it first becomes statistically apparent after 1956. The reason is that the search for oil rose rapidly until after 1956 when the current glut in oil began. During the period 1947–56 there was a substantial increase in oil exploratory drilling. During the same period there was also an increase in gas exploratory drilling, and also an increase in gas price. For the period 1947–56, it is impossible to determine from the evidence presented whether the increase in gas exploratory wells resulted from a nondirectional search for oil, where some of the exploratory drilling happened to produce gas reservoirs, or whether the increase in gas wells resulted from an independent search for gas reservoirs resulting from the higher price for gas. However after 1956 oil exploratory drilling began to decline rapidly, while gas prices continued to rise. It is the behavior of gas exploratory drilling during this period that suggests that many producers have developed the ability to drill directionally for gas, and that as a consequence the supply of gas well gas has become considerably more elastic than it had previously been. This matter warrants the closest analysis.

It is useful to begin by considering the economic changes in the fortunes of oil and gas during the period between 1947 and 1960. Domestic oil and gas revenues increased sharply after World War II, with oil revenues reaching their peak in 1957. The following table shows the abrupt change in the revenues of oil and gas thereafter:

	Oil Revenues	*Gas Revenues*
1957	$8,079,000,000	$1,202,000,000
1960	7,419,000,000	1,790,000,000

Between 1957 and 1960 domestic oil revenues declined 8 percent while gas revenues increased 48 percent. This change is reflected in the results of the industry's search and discovery efforts for oil and gas.

A convenient measure of the industry's efforts in searching for gas and oil is its drilling activities. These are divided generally between exploratory and developmental drilling. Exploratory drilling is a crucial facet in the long run

discovery of new reserves, whereas developmental drilling develops reserves connected with known reservoirs or formations. The future supply of gas depends on the exploratory wells the industry will drill. For these reasons, directionality when used herein will refer to exploratory drilling. The table below shows the industry's well drilling footage for the years 1950–61 for gas and oil, broken down between exploratory and developmental drilling.

U.S. continental successful well footage

[Thousands of feet]

Year	Exploratory Footage		Developmental Footage	
	Gas	Oil	Gas	Oil
1950	1,253	3,607	12,432	89,088
1951	1,502	4,767	12,444	90,339
1952	1,963	4,752	13,294	93,395
1953	2,160	5,322	16,088	96,813
1954	2,382	5,525	16,475	107,837
1955	2,251	5,626	17,680	115,523

1959	2,606	4,003	24,001	90,607
1960	2,185	3,331	26,014	83,207
1961	2,109	2,922	27,070	82,586

Sources: Exhibit 21, Schedule 9. *World Oil*, February 15, 1962.

NOTE.—This table is copied from Exhibit 21, Schedule 9 and is updated from the source used in preparing that exhibit, *World Oil*. *World Oil* provides a breakdown between "wildcat" wells and total drilling. It appears that the term "exploratory" used in this table corresponds to the term "wildcat" used in *World Oil*.

As compared with the 1955–1956 peak, oil exploratory footage fell by 49 percent in 1961, while gas exploratory footage declined only 12 percent; the 1959–1960 average was 0.3 percent higher than the average for 1955–56. The footage of oil developmental wells fell 28 percent between the 1955–1956 peak and 1961, while gas developmental well footage rose by 43 percent. Two conclusions are suggested by these data: first, the stability of gas exploratory drilling relative to oil after 1956 reflects separability in the search for the two products; second, exploration is still markedly less completely directional than developmental drilling, as evidenced by the uninterrupted and continued sharp increase in developmental drilling of gas wells while exploratory drilling declined slightly.

That the search for gas can be made on a directional basis is supported by the testimony and exhibits of witnesses for six large producers, Phillips Petroleum Company, Pan American Petroleum Corporation, Socony Mobil Oil Company, Inc., The Atlantic Refining Company, Shell Oil Company, and Sun Oil Company. These witnesses testified that their geologists have been predicting prior to drilling whether exploratory wells would yield oil or gas, and have kept formal records of their results of their predictions in recent years. They have submitted data covering all the exploratory wells drilled over several recent years by their companies showing the predictions and their accuracy tested by the results. There is no challenge to the reliability of the data. The results show a high degree of accuracy, in the main from some 80 to above 90 percent. These predictions were analyzed by a mathematician whose testimony shows that the results could not have been achieved by chance.

Mr. Allen, general geologist for Respondent Phillips, testified that Phillips' geologists have found that:

> * * * below certain depths in some areas and at all depths in other areas the productive reservoirs which have been found are predominantly gas reservoirs. For example, below 8,000 feet in the Texas and Louisiana Gulf Coast, more than half of the producing reservoirs are gas and below 12,000 feet

approximately 70 percent are gas. In Pennsylvania and West Virginia, gas reservoirs predominate below 5,000 feet. In northeastern Ohio, from the Clinton formation on down, gas again predominates. In other areas, such as the Green River Basin, the Anadarko Basin, and the Arkoma Basin, gas reservoirs predominate at all depths.

Of more immediate interest to this particular Permian Basin hearing, as Mr. Hills has pointed out, in the Delaware and Val Verde Basins of Texas and New Mexico which comprise the southwestern part of the Permian Basin Area, few oil reservoirs have been found below 6,000 feet, but this is the area in which the deep Puckett and Brown-Bassett gas fields have been found. Anyone drilling below 6,000 feet in those basins, should, on the basis of experience, realize that he is spending his money primarily in the search for gas. Obviously, in these areas and at these depths, the primary objective of many of our exploratory expenditures must be for gas. (1/161–2.)

In the Permian area in the Delaware and Val Verde Basins gas predominates below 6,000 feet; even the few oil wells found there have been mostly commercially unimportant. In the remaining portion of Permian oil generally predominates at all depths. However, there are also many particular areas in Permian where gas predominates. See *e.g.*, Respondent witness Hill's Exhibit 2, a map showing the principal oil and gas fields in Permian.

Phillips' Midland Division covers the general area of Permian. Phillips submitted a breakdown showing the accuracy of its predictions for the entire Midland Division, for the Delaware and Val Verde portion of the Midland Division, and for the Midland Division excluding the Delaware and Val Verde Basins. The accuracy of the predictions for these three areas was 88 percent, 87 percent and 88 percent, respectively.

After analyzing the results of Phillips' predictions, Allen testified that "Phillips can focus its domestic exploration toward and does search independently for oil and for gas," and again:

> * * * most of the casinghead gas that is found in the future will be found as a result of the search primarily for the oil with which it occurs. However, with respect to the nonassociated gas which includes gas from dry gas reservoirs and from gas condensate reservoirs, the future discovery of that type of gas will depend to a great extent upon an objective search for that gas as such. (1/158.)

Allen states that in approaching a totally unexplored area he would not be able to make predictions with respect to finding oil and gas, but he adds that only a very small percent of the industry's exploratory drilling is in such completely unknown areas. Respondent witness Brackbill of Shell also states:

> * * * most of the areas of the United States have been sufficiently explored that when an operator goes in to drill a well, he pretty well knows that his major objective is some formation which is gas-bearing in such and such a location, or oil-bearing, or both, but just to say that he is going out and drilling for whatever he can find, this may have been true 20 years ago but I certainly don't think it is true today.
>
> I think Mr. Allen pretty well explained that. The industry is a lot wiser than it was just prior to the war. (Tr. 35/4147–8.)

Distributor witness Kahn after considering the testimony of the producers concludes that "* * * clearly we are at or have already crossed that threshold of a high degree of separability" in the search for gas, and "The industry has learned to a large extent, to divorce the search for gas from the search for oil. The preponderant amount of gas is now discovered in nonassociated form." (66/7,264, 7,291.) Distributor witness Netschert refers to "The very recent realization that nonassociated gas is a common hydrocarbon occurrence at depth

and the emergence of the ability of the industry to direct at least part of its search for natural gas alone * * *" (57/6,342) and again to "the search for gas for its own sake." (57/6,299.) The Distributors have accepted the validity of the Respondents' contention that they can successfully direct their search for gas or oil, stating on brief "There can be little question with the conclusion that producers have been increasingly successful in concentrating their effort in directionalizing their search and to a significant degree are now able to search for gas." (Distributor brief, p. 20.)

The Staff disagrees. It contends that "Directional ability, to the extent it exists, is not new" (Brief, p. 251), which is not relevant in disproving the ability. What is new is that this is the first case before the Federal Power Commission where producers have claimed that they could search for gas directionally.

Staff argues that the six Respondents have not shown themselves typical of the producing industry and that there is no indication that the industry in general can imitate them. These six companies are active in most of the gas-producing areas. Allen testified that "Any other producer that has available an adequate staff of geologists either internally or on a consulting basis, and adequate information can do what the six companies have done." (237/Appendix A, p. 32.) More importantly, the statistical evidence previously cited showing that gas exploration remained stable in the face of the oil decline indicates that the ability to search directionally is not confined to the six companies which decided to keep specific records of their directional predictions.

There is testimony that small producers often do less advance geological research than large producers, preferring to rely more on the results of drilling; hence in general they may be less able to direct their search than large producers. But some 75[8] large producers (those selling over 10 million Mcf of gas annually in interstate commerce) sold approximately 82 percent of the jurisdictional gas sold in the United States in 1960. And in Permian some 49[8] large producers sold approximately 87 percent of the jurisdictional gas sold in 1960. The large producers also drilled to greater depth than the small producers. The evidence indicates that the significant future discoveries of gas are likely to occur at depth below 6,000 feet. Thus they are more likely to be discovered by companies which are in a position to make the studies for directional drilling; or if drilled by small producers on farmouts, they will probably have the advantage of the large producer's research. In any event, it is unlikely that even a small producer would engage in expensive deep drilling without having secured the kind of geological research that would permit directional drilling in circumstances where such information could be obtained.

Staff also relies on the testimony of Texas Railroad Commissioner Murray and witness Abel, a small producer. Commissioner Murray conceded that directional drilling could be done in certain specific areas; and Abel testified that, like other small producers, he preferred to spend his money on drilling rather than seismic research. There is no indication that either witness was familiar with the extensive statistical data, testimony or analyses on this subject submitted by Respondents and the Distributors. These two are the only dissenting witnesses on this subject outside of Staff witness Wein.

Staff argues that the increasing proportion of gas successes to total wells in recent years does not result from the higher price for gas and directional ability, because there were several earlier periods, 1909, 1915, 1930, when the proportion of gas to total productive wells also increased. From this, the Staff witness concludes that the proportion of gas wells to total wells varies cyclically and that

[8] These figures include gasoline plant operators selling residue gas whose raw oil component is to a substantial extent produced by numerous percentage sellers.

the recent increase is merely the upswing of the most recent cycle with a downswing in the proportion likely in the future. No explanation is offered for this cyclical behavior. Staff's data does not relate gas exploratory wells to total productive exploratory wells; it relates total gas wells to total productive wells. Total productive wells are heavily weighted to development wells, more than 90 percent. Development wells are weighted to oil due to the more intensive spacing of oil wells than for gas wells. Moreover, in 1909, 1915, and 1930 producers who found gas reservoirs were not as likely to be drilling the full complement of development wells to prove the total reserves, as they would where they found oil reservoirs. Analysis of the absolute numbers of the gas wells for these earlier periods shows that there was no cyclical change in the number of gas wells drilled; the peaks for the percentage of gas wells to total wells simply reflect low points in oil development drilling.

With regard to the future, the ability to drill directionally is based on accumulated knowledge; so the ability is likely to increase with the geological knowledge that is always accumulating from drilling. Now that the directional hypothesis and the statistical results on which it is based have been made widely known, producers are more likely to seek the kind of knowledge that will permit such predictions. Finally, there is the element of incentive in connection with the directionality hypothesis. If price incentives are offered for new gas well gas, the only gas which can be sought directionally, producers are likely to be motivated by the profit prospects to acquire the knowledge and techniques to increase their ability to search for gas directionally.

The evidence adduced does not, of course, conclusively prove the validity of the directional hypothesis. But the industry statistics, the testimony of the witnesses for the six companies, and the fact that these companies explore on a national basis suggest that the ability is not confined to a single or a few areas. The Commission needs more data and study for a final evaluation. That can and no doubt will be furnished in future cases. But the preponderance of evidence in this proceeding is that there are areas and depths where gas predominates, and that the search for this gas is in large measure separate from that for oil. Accordingly, it is concluded that, to a very considerable though undefined degree, the industry can direct a substantial part of its exploration toward gas or oil reservoirs.

b. Effect of Directionality on the Elasticity of the Supply of Gas Well Gas.— The consequences of the directional hypothesis are most significant for regulatory method. So long as drilling is nondirectional the supply will tend to remain markedly inelastic, and the regulatory agency will not be able to employ price as an effective tool for eliciting supply. In that situation the Commission may have the power to control the price, but this power will not enable it to induce the needed supplies to be brought forth.

Since gas is still a minor part of the total oil and gas production industry, any attempt to push up the aggregate oil and gas effort by manipulating the gas price alone would be absurdly expensive in terms of the results it is likely to achieve. But if the producers can drill directionally for gas, the elasticity of supply will be substantially increased, because they will be able to direct their efforts toward gas when it is economic for them to do so. This will tend to reduce the time lag when new gas supplies can be made available. So even if the elasticity of supply remains below unit elasticity, if price will evoke a substantial supply response, it can be used as a reasonably effective instrument in eliciting supply.

The increasing proportion of gas well gas reserves added to total gas reserves added throughout the recent period of rising prices suggests a growing directional ability and responsiveness of gas well gas to price. The annual propor-

tions expressed as a percentage derived under the methods of Drs. Foster and Joskow are shown in the table on page 324.

Staff not only denies that the producers' directional abilities have been shown to be substantial, it denies further that "gas price has had or is coming to have a significant impact on exploration or gas supply even if the industry's exploratory ability is highly directional," because "the evidence instead demonstrates the absence of significant responsiveness of gas supply to gas price." (Brief p. 255.) "Gas supply (in the sense of reserve additions) [9] and exploration have not been responsive to price." (Brief p. 236.) Respondents, on the other hand, contend that "the supply of gas is price elastic" and "that the supply of gas is substantially and significantly dependent upon price." (Joint brief p. 60 and 40/4,553–4.)

The controversy between Staff and Respondents about whether the supply of gas is elastic, or alternatively, substantially responsive to price changes, centers about the parties' respective interpretation of Respondents' Exhibits 306 and 24.

Respondent witness Foster's Exhibit 306 is a study of the relationship between the average new contract price of gas and exploratory activity as measured by gas exploratory footage for the seven southwest states for the period 1945–62; these states produce 95 percent of the country's gas. Chart 1 of the exhibit expresses the results graphically and is reproduced on page 331. The Presiding Examiner has added to Dr. Foster's chart an index of oil exploratory drilling corresponding to the index of gas exploratory drilling shown in the exhibit. The data used in Exhibit 306 plus the additional data are shown below. The chart makes clear that there is a high correlation between the increase in gas prices, gas exploratory drilling, and oil exploratory drilling between 1945 and 1956. After 1956 the three indices diverge; gas contract prices continue to rise to 1959 and then decline slightly; gas footage begins to decline in 1957, rises again briefly in 1959 and then drops sharply till 1962, when it reaches the 1955 level; oil exploration begins to fall in 1956 and continues precipitously downward.

Relationship between average new contract price of gas and exploratory activity—seven Southwest States,[1] 1945–62

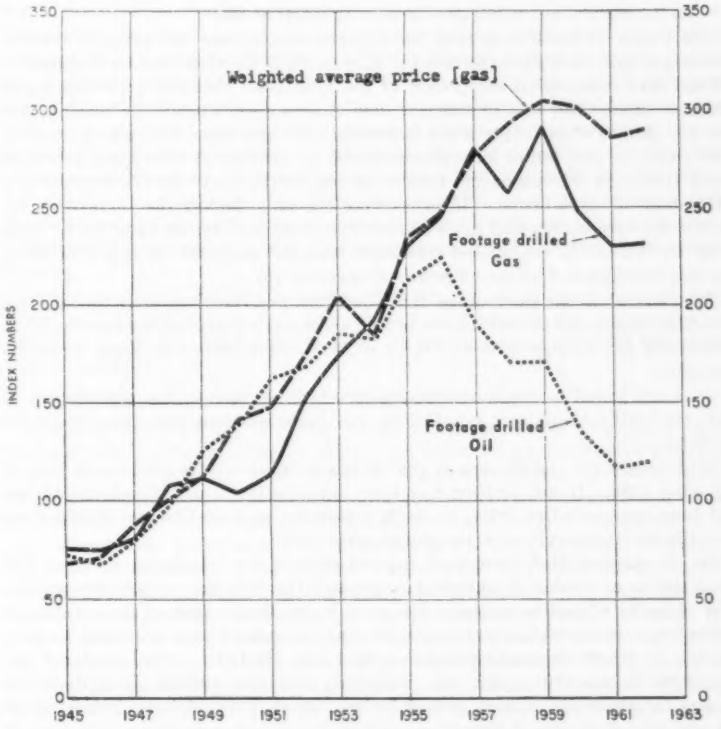
RELATIONSHIP BETWEEN AVERAGE NEW CONTRACT PRICE OF GAS AND EXPLORATORY ACTIVITY
(MEASURED BY GAS EXPLORATORY FOOTAGE)

SEVEN SOUTHWEST STATES, 1945-1962

(1947-1949=100)



The behavior of gas exploration footage throughout this period suggests that it has been a function of at least two major factors: first, the effects of a non-directional search whose major economic motivation was the increased demand for oil; second, the directional search for gas stimulated by the rise in the price of gas. Both factors pushed gas footage up from 1945 to 1956. After 1957 when oil exploration began to drop, gas exploration also fell, but not as much as oil. Gas price alone was not strong enough to hold gas to its level. But gas price was strong enough to enable gas exploration to resist plunging with oil. The supply of gas is not elastic, for if that were so, the correlation between the gas price index and the gas exploration index would continue after 1956. But the results suggest that the supply of gas was responsive to gas price to a considerable degree.

Dr. Foster's analysis of the data is:

> * * * the statistical correlation is quite high for each of these series. The mere fact of a close correlation does not, of course, indicate the existence of the cause and effect relationship. I made other studies bearing on this exercise of judgment as to the causal relationship, or rather the meaning of the correlationship. It is my belief that the increase in gas prices over this post-war period has had a strong and extremely significant affect on drilling activity in exploration for gas.
>
> The basic reason for that conclusion is that I can not explain the behavior of the data drilling activity productive of gas and productive of oil on the basis of any other hypothesis. (205/24759–60.)

Dr. Foster is sound in noting the high correlation over the entire period between gas price and gas exploration. Also sound is his view that an explanation of the data requires an acceptance of the hypothesis that gas price had a significant effect. But this hypothesis alone does not explain all the results, such as: the failure of gas exploration to continue its correlation with gas price after 1957; the rise and fall of oil exploration and its correlation with gas exploration until 1956; and the subsequent path of gas exploration between the orbits of gas price and oil exploration. If price were the only factor, the correlation between gas exploration and price should have been maintained after 1957. Note that Dr. Foster in the quoted statement does not deny the existence of other factors although he does not affirmatively mention any.

Staff examines the gas footage data since 1955 and concludes that "an increase in initial base price in new contracts was accompanied by little recent change in successful gas footage drilled." Brief p. 238. These comments apply to Staff's analysis:

It is not sound to reach conclusions about the existence of a relationship of this type without at least considering the available data over the full period 1945–62.

Staff misses the significance of gas' ability to maintain its level above that of oil after 1956. If gas drilling has been nondirectional and if gas supply has not been responsive to price, as Staff maintains, gas exploration should have paralleled oil exporation in its plunge after 1956.

Dr. Foster and Staff have each focused on half the significant results. The explanation of neither is sufficient to explain the behavior of gas exploration. The capacity of gas to maintain the level it did in the face of the oil decline indicates a considerable directional ability and responsiveness of supply to price, though an elasticity considerably less than unit elasticity. The supply of gas measured by gas exploration was "relatively inelastic" during the period; but it was far above the almost perfect inelasticity that would have characterized oil well gas, or all gas, if directional exploration and responsiveness to price had been negligible.

These conclusions are also applicable to Exhibit 24, which is similar to Exhibit 306.

Staff argues that its "econometric studies show that gas supply is not responsive to gas price." Brief p. 252. The Staff's pioneering econometric study is, however, based on a nondirectional hypothesis. The crucial exploratory equation is for total exploration, gas and oil. It does not differentiate between the relative effort directed toward gas or oil within a given total level of exploratory effort. Staff witness Wein acknowledged that if the directional hypothesis were to be accepted, a materially different equation would be required. Since the directional thesis has been found to be a valid working hypothesis, the results of the econometric study presented herein are not relevant or material to the problem.

Staff argues that gas well gas supply will not be affected by the price for gas because 23 percent of Respondents' revenue from gas condensate leases consists of liquids. But the substantial percentage of 77 percent of the revenues from gas condensate leases comes from gas.

Staff also contends that gas well gas supply will not be responsive to price even if the producers can drill directionally for such reservoirs because the size of the reservoir and its potential value is not predictable under the directional theory as thus far established; and in view of these circumstances and the other unknown factors which "enter the calculus of whether or not to drill on a particular prospect. . . . Price differences of a few or even several cents would not often be crucial in the decision making process". (Brief pp. 243–4.) The problem in this case does not concern the decision whether to drill a single prospect; it concerns the industry's decisions regarding thousands of prospects in a huge area. This whole industry operates on probabilities and the averaging of results over thousands of prospects. In considering over-all results, price differences of several cents are important, and knowledge of the probable product increases the producer's ability to respond to the economic incentive of price.[10]

During the period of rising gas prices between 1947 and 1960, the ratio of gas well gas reserve additions to oil well gas reserve additions increased substantially. The only reasonable explanation for this behavior is the existence of a considerable directional capacity and a consequent ability of gas supply to respond to price.

Staff's conclusion on brief at p. 243 "that despite the presence of some directional capabilities (as between gas and oil exploration) gas supply has not been and is not now responsive to price" is not in consonance with the weight of the evidence.

5. The Effects on Supply of the Contractual Dedication of Gas

Typically gas is sold under twenty-year contracts. After a producer enters into such a contract, he is legally obliged to deliver the gas contracted for, to the extent it is economically available from existing facilities. Generally a producer has found a considerable amount of gas before the contract is negotiated. An increase in price thereafter will not substantially increase the supply of gas that has already been found and made available. Sometimes the producer is obligated to undertake further development, more often not. However, even though the contract does not legally oblige him to continue to develop additional supplies, as a practical matter he has strong economic incentives to do so, if it is profitable. So long as the contract remains in existence, he cannot sell the gas which is subject to the contract to any other purchaser. The contract will continue for its full 20-year term unless the gas is exhausted, or unless terminated by mutual agreement. A purchaser is unlikely to agree to terminate a contract with a price advantageous to him if there are indications that additional reserves could be developed on an economic basis from the underlying dedicated acreage. Furthermore, if commercial production ceases, the producer is likely to lose his lease. Also most gas contracts cover sales from areas or acreage that has been explored to a considerable extent and partially developed. Where these costs have already been incurred for committed gas, the producer is likely to develop and deliver the additional reserves if it is profitable to do so on an incremental cost basis, rather than just sit on the gas. In these circumstances raising the price for committed gas is not likely to increase supply to a substantial extent, because the institutional and economic incentives will tend to induce the producer

[10] Staff's position here is inconsistent with its approach in other parts of its brief, that the industry and its behavior must be considered and analyzed on the basis of its over-all results, and not on the basis of individual prospects.

to obtain and deliver the gas anyway. As a result, the supply of committed gas tends to be much less elastic than the supply of new gas.[11]

There are marginal situations where the supply of gas will be considerably affected by price, even though the gas has been dedicated under a contract. Thus a producer may be at the marginal point where the cost of reworking a flowing gas well will not quite equal the expected revenues to be obtained under an existing price; or the price will not quite justify pumping a well whose pressure has reached the abandonment point. There are also situations where at a particular price, the cost of further exploration or development will not equal the prospective revenues. In these cases, even though the gas be committed, its supply can be affected to a considerable degree by the price, because the producer is, economically, at the marginal point of further investment, and, legally, at the point where he is under no further obligation to make an additional investment under the contract. These marginal situations will, of course, tend to occur at any price level. While they do and will continue to exist, in the main, the supply of committed gas is much less elastic than the supply of new gas. This is true of all gas, but the principle is most apposite for gas well gas. The supply of oil well gas is so largely dependent on the search for and production of oil that the additional effect of a "commitment" with respect to oil well gas is not nearly as significant as in the case of gas well gas. For a particular gas well prospect there is a point where supply will become responsive to price, the point at which prospective revenues are greater than prospective costs, (taking into consideration alternative opportunities); more technically this is the point at which marginal revenues equal marginal costs. At prices substantially below this point, an increase in price will not evoke additional supplies because the prospective cost of adducing this supply exceeds the prospective revenues. Respondents imply that there is a particular price at which the supply of gas in general will become elastic. However, for the industry as a whole, there is a range of points at which responsiveness to price will begin, depending upon the varied anticipated costs and estimated revenues of thousands of individual prospects. For the industry as a whole, which is what is being considered here, there is a supply-price schedule rather than a single point at which supply elasticity will increase.

6. Conclusions on the Nature of the Supply of Gas

The foregoing suggests these conclusions:

a. Discussion of the elasticity of the supply of gas as such is no longer meaningful. At the present time the subject is meaningful only when applied separately to gas well gas or oil well gas.

b. In the past, the supply of gas was extremely inelastic because gas was found largely as an incident to exploration for oil, except in a few areas.

c. The search for gas as such is a more recent development and that search has become directional to a considerable degree. There are definite areas and depths where gas predominates. If this gas is needed, it must be searched for and found separately from oil.

d. As a result of the ability separately to direct the search for gas well gas and the contemporaneous rise in the price of gas, the supply of new gas well gas has become responsive to price, though it has not achieved unit elasticity.

e. The supply of committed gas well gas is much less elastic than that of new gas well gas, though there are marginal situations where, it being no longer economic to continue further development or production under the contract, an increase in price will tend to elicit additional supplies.

[11] That economic and institutional factors tend to have certain consequences is not to say that they or their consequences are desirable or undesirable. It is just a matter of describing a situation.

f. The directional capacity and the responsiveness of new gas well gas to price are the elements that mark a sharp break with all earlier cases in the Commission involving producer gas rates. The evidence in this proceeding warrants the acceptance of substantial directionality and consequent responsiveness to price as a valid working hypothesis in dealing with costs and rate design in this proceeding. This breakthrough affords an opportunity for a new approach.

H. GAS FINDING COST AND PRICE TRENDS

The indices of cost per Mcf of reserves added for witnesses Foster and Joskow between 1947 and 1960 show increases of 88 percent and 60 percent, respectively. The index of the average price paid by interstate pipelines shows an increase of 215 percent over the same period. Even in terms of constant purchasing power, price per Mcf increased 134 percent, much more than the increase in cost per Mcf. That intrastate prices increased less is suggested by the index of average prices received at the wellhead, which shows an increase of 134 percent, compared to the 215 percent increase in interstate prices.

I. RECENT TREND IN THE COST OF FINDING GAS

The indices of Respondent witness Foster and Distributor witness Joskow of drilling and equipping costs per Mcf of gas reserves added are the best measures of the cost trend in finding gas over the whole period 1947–60. Both indices show a substantial increase in cost over the entire period. Dr. Foster's index shows a fairly uniform rise throughout the period, while Dr. Joskow's shows a slacking off in the last years, except for 1960, which results from the unusually low findings reported for that year. The statistical techniques employed in these exhibits for smoothing out the data are useful in presenting a description of the trend over the whole period. But they obscure short-term movements or intermediate changes that would indicate recent trends.

The IPAA index of drilling costs shows a rise in cost over the period 1947–60, but a slackening in the rate of increase after 1958. Moreover the actual rise in drilling costs since 1958 was probably less than shown by the index. This is because this index is based on posted or listed prices for various items. The upsurge in oil drilling from 1954 through 1957 was accompanied by a rise in drilling costs. The period since 1958 has been one of price weaknesses in the drilling contracting industry, reflecting the decline in oil drilling, and, because of the greater amount of oil than gas drilling, the consequent decline in total drilling. In such a period, discounts from list prices of industrial goods and services are common but these are not reflected in the IPAA index. If consideration is given to this factor, the actual rise in costs since 1958 was probably less than shown by the IPAA index.

Dr. Foster's index of drilling costs per foot 1947–60 shows a generally uniform increase over the period, but a negligible rise between 1959 and 1960. This index is based in part on the IPAA index and on the American Association of Oilwell Drilling Contractors prices.

The Staff Appendix A results show the costs of drilling and the footage drilled for each of the years 1955–1960 for some 240 companies which accounted for about one-third of the industry's well drilling activity in 1960. These companies were not selected on a random basis. That the sample is not representative of the level of industry costs is shown by the fact that in 1960 these companies accounted for 24 percent of the wells drilled in the United States but 34 percent of the total footage drilled. This indicates that these producers drilled deeper wells than the average producer. The data show the annual drilling costs over a 5-year period for a large sample of identical companies, many of which operate in many areas of the country. The results of a group of this type and size are

likely to reflect the general forces making for changes in costs. Hence, the Appendix A sample can provide a sound indication of relative drilling costs during the different years, even though these results are not representative of the absolute level of these costs. Supporting this conclusion is the trend for the years 1955–60 in depth of wells, which shows an increase for the Appendix A companies of 7.3 percent; this parallels the industry-wide increase in depth shown in the more complete World Oil Series of 8.2 percent. Also the figures for the Appendix A companies show that the drilling costs of most types of wells and at most depth ranges rose between 1955 and 1957 or 1958 and declined thereafter. The wide range and general consistency of the over-all results suggest that these results are indicative of a general trend for this period.

The tendency shown by the Appendix A results for the cost rise to level off during the period immediately preceding 1960 is in consonance with the general pattern of the IPAA index and Dr. Foster's drilling index. This is also consistent with the general price trend. The Bureau of Labor Statistics Wholesale Price Index for all commodities rose from 66.1 to 100.7 between 1946 and 1960 (1957–9=100). Between 1955 and 1960 it rose from 93.2 to 100.7. But between 1958 and 1960 its rise was only from 100.4 to 100.7. Other general price indices also show that the rate of increase in general costs and prices slackened after 1958.

The conclusion is warranted that the rise in the cost of finding gas tended to level off during the period immediately preceding 1960.

J. THE TWO-PRICE SYSTEM

The economic and institutional factors previously discussed suggest several conclusions regarding the design of a price system.

The largest future source of supply of gas will probably consist of new reserves of gas well gas. There are certain areas and depths where this gas predominates. The supply of gas from oil wells and from gas wells found only as an incident in a search for oil will probably not be sufficient to meet demand. The bulk of the gas well gas, coming from gas predominating areas will become available only if the separate economic cost of finding and producing this gas is met.[13] As Respondent Texaco's witness Park stated in referring to his exhibit on new gas well gas:

> One of the basic reasons for making this analysis on gas well gas is that in 1961, nonassociated gas constituted 89 per cent of the natural gas reserve additions and about 72 per cent of the gross production of natural gas.
>
> While these percentages are for the most recent year, both percentages have been increasing for the past several years and are expected to be maintained if not increased in the future.
>
> In addition, there has already been testimony in this record by producer management to the effect that the domestic oil situation is such that if consumer demands for continued, adequate, expanding natural gas resources are to be satisfied, the brunt of the task will fall to the search for and development of nonassociated natural gas supplies. (158/17,659.)

Since costs for gas have increased during the period 1947–60, additional supplies of gas well gas require that the current costs for such supplies be determined and used as the initial basis for the price of this gas. An allowance below the economic cost will not be effective in eliciting the supply of gas well gas. A cost based solely on averaging the historical costs of all flowing gas, or even on all flowing gas well gas, may return to producers as a group the sum of the costs they have incurred in the past and render them whole. But such a cost

[13] In some respects the search will probably always be joint.

allowance on an area basis will not provide the incentive for producers to seek new supplies of gas well gas whose current cost exceeds the average historical cost. Therefore the cost for new gas well gas must be independently found and used as a basis for the price of new gas well gas.

Because of the time lag in finding and producing gas, the rise in costs over time, and the change in the nature of the search, most of the gas now flowing was discovered many years ago, and to a substantial degree, as a by-product in a search for oil, or at a time when it took a much lower gas price either to elicit the required exploratory efforts or to induce the commitment of those supplies. If the price for new gas well gas were to govern all old (flowing) gas, an unnecessarily high price would be paid producers. Furthermore, this high price would not serve to any great extent to elicit new supplies of gas well gas, because producers receiving this high price for old gas would be free to reinvest it in oil, chemicals or real estate.

For these reasons, the basis for pricing flowing gas and future supplies of oil well gas should be determined on a different basis than for new gas well gas.

The primary basis for the two-price system is that in the special economic and institutional background of the gas finding industry, it uses price more efficiently than a one-price system as a tool to bring gas to market. It pays the current economic price required to elicit new supply and this payment is made only for results achieved. For other gas, the price is determined on a different basis. The producer is paid for what he produces.

The two-price system is fairer both to the producer and to the consumer: the producer receives the current economic cost for gas for which he incurs the expense of a separate search at today's price level; and the consumer pays the premium price only for that gas which will tend to be found as a result of the separate higher cost search. The producer will receive and the consumer will pay a lower price for the old vintage gas, or the gas found jointly with oil.

Staff advocates a one-price system, *i.e.*, a pricing system under which the price for new gas well gas is determined on the same basis as for old gas well gas, in this case, historical cost. Staff's rationale is threefold: (a) gas well gas cannot be found directionally to any significant degree; (b) gas (including gas well gas) is not responsive to price; (c) costs have not risen since early in the 1950's. A further reason might be that gas well gas supplies which might be found directionally are not needed because adequate supplies of gas will be found as an incident to the search for oil. Under these conclusions, the average historical cost for gas well gas will return to producers their average costs. The price won't significantly influence the supply; but under Staff's view no price (in the range of reasonable probabilities) for gas can do this.

Respondents advocate a one-price system, Distributors and CPUC a two-price system.

The Presiding Examiner concludes that the rise in the price of gas in recent years has been due largely to the substantial increase in demand acting upon a sluggish supply. He further finds that gas well gas will be the major source of future gas reserves and that this source will be discovered in major part through the directional search for gas reservoirs. Because of the substantial rise in the cost of finding gas over the past two decades, a one-price system for currently flowing gas and for new gas well gas will either not be high enough to influence the search for and eliciting of the gas well gas supply to the extent needed; or it will provide an unreasonably high price for old gas or new gas found in a directional search for oil. Against the background of the economic and institutional factors governing the finding and production of gas, equity and efficiency of price as a tool indicate that a two-price system be adopted in the establishment of a rate system in this proceeding.

312-270—69——25

II. THE COST OF NEW GAS WELL GAS

The first requirement for determining the price for Permian new gas well gas is to determine an appropriate cost. After that, other relevant factors can be applied to determine the price.

First, it is necessary to make clear the term "cost." As an economic matter, cost is the measure in dollars of the effort needed to elicit the supply of a product. Economic cost is sometimes termed "alternative opportunity cost" or "avoidable cost." These phrases refer to methods of determining economic cost by measuring the supply that would not be elicited if the particular cost effort were devoted to the next most profitable activity.

In the case of a purely joint product, it is impossible to isolate a portion of the total costs and use this portion as the separate cost, in the economic sense, of one of the products. The expenditure of that amount of effort will not produce the separate product. Only the expenditure of the total joint costs will produce both joint products.

For various purposes it is sometimes necessary to divide joint costs among the separate products. One can divide or allocate total joint costs by various accounting methods or physical formulas: for example, according to the relative sales receipts from each product, according to the ratio of the cost of producing each product separately, though under different circumstances, according to some physical measurement such as weight, volume, Btu's, etc. But the division of joint costs into separate parts by these methods does not measure the cost of producing the separate products. The results attributed to the separate products will not, if expended separately, elicit the supply of the product. Much, much confusion in this case results from the practice of certain parties of referring to and treating the results of their allocations of total joint costs as the cost of the separate items. They aren't. If oil well gas is being sought, the expenditure of the dollar amounts which represent the division of total costs that have been allocated to oil well gas, won't yield much of this gas; the incurring of this cost in a search for oil well gas (or in a non-directional search for gas) may well produce a good deal of oil, but only incidentally, some gas.

For many products a part of the costs are joint, and reasonable allocations are used to divide these joint costs. The problem is more difficult in this industry. Where, as in the case of oil well gas, all of the costs are joint, and the gas is the minor product produced with oil, the results of allocations of total costs have little economic meaning.

In the past, one of the problems in determining the price of gas has been that since the search for all gas was in the main joint with oil, the cost of gas could not really be determined. What was attempted in the *Phillips* case was to determine an equitable, reasonable, fair division of total costs. So long as these costs were not regarded as influencing supply, the only requirement was the reasonableness and fairness of the division of the total burden between gas and oil. But no matter what the answer, the price for the minor product, gas, would not significantly influence its supply under the theories then existing. But in the instant case the problem is of a different dimension. Because gas well gas can now be found separately to a significant degree and because its supply can now be influenced by price to a degree warranting the use of price as a tool in eliciting this supply, it is necessary as an economic matter that its price be related to cost, so that the price paid measures the cost to elicit units of supply. Therefore, the first and most important task in this case is to determine the cost of new gas well gas on an independent basis.

Because gas well gas can now be sought and found separately, the expenses and expenditures relating to it can also be separately determined to a greater degree than was possible when the search was nondirectional or joint. While

the ability to search for gas well gas directionally reduces the allocation problem to a considerable extent, it does not eliminate it entirely, partly because at this stage statistics on many separate items of cost are not available, and partly because the search is not yet completely directional and probably never can be. When it is said that the cost of gas well gas must be determined independently and as a separate item, it is not meant that a pure cost can be refined. What is meant is that a reasonable approximation of the separate cost for new gas well gas should be determined. In a large industry it is only rarely that the pure cost of a single product can be isolated. There is almost always the burden of some joint costs and common costs in the form of overhead. But reasonable approximations of costs are used as working tools in most industries. So here, even though the separate determination of the cost of new gas well gas may not be precise, it can approach to a considerable degree the cost of finding new gas well gas. In comparison, the divisions which result from the allocations of the joint historical costs relied on by Staff bear much less relation to cost. As explained by Respondent witness Sherwin:

> Coming back to my illustration, if you take the cost of non-associated gas and compare it to the cost of associated gas, or perhaps to the traditional cost of service, including those that have been introduced in this proceeding by parties testifying prior to February 28, you can see the results, you can measure the impact, I will say.
>
> Now, in my study, for example, on the cost of non-associated gas, the proportion of cost that is directly identifiable with gas, and therefore requires no allocation in the sense that the cost of associated gas does, is 45%, as indicated at transcript 14,376.
>
> The joint costs, as there stated, are 31%. The remaining costs which are in part in the nature of common costs and in part in the nature of joint costs, are 24%. But when you come to the cost of associated gas, 100% is joint. To that extent there is a very significant difference in terms of reliability between the cost of non-associated gas as presented by myself and Mr. Roseman, and, for example, the Staff's cost of service. (164/19,171.)

Estimates of cost for new gas well gas were submitted for the Respondents by Dr. Sherwin and Mr. Park, for the Distributors by Mr. Roseman, and for the CPUC by Mr. Doran. The Staff rested on its presentation of allocated historical cost because it did not accept the validity of the directional hypothesis and, in its view therefore, the determination of the current economic cost of gas well gas is of little significance.

A. NATIONAL OR PERMIAN COST BASIS

In determining the cost of new gas well gas, the first issue is whether the cost for new gas well gas should be determined on a national or a Permian basis. The question is not whether a national price should be established and then applied to Permian; it is whether national costs should be used as the point of departure in determining Permian prices.

The considerations in favor of using national instead of area costs as a basis for pricing here are:

1. A pricing system based on national costs will tend to induce capital to flow into areas where unit costs are low. A system based on area costs will tend to produce a high price for a high unit cost area and will tend to make investment in such an area as attractive as in a low unit cost area. This will tend to shunt capital away from areas where its marginal efficiency is high.

2. The supply area for the West Coast is broader than the Permian area. West Coast supplies come from the San Juan Basin, the Rocky Mountains,

California and Canada as well as from Permian. These alternative sources affect the demand for and the value of Permian gas. The increase in the mobility of gas supplies causes gas discoveries in any part of the country to have an impact on the market for gas in other parts, if only by backoff. In general it would be desirable to use costs which are based at least on an area as extensive as the market and the value factors affecting it.

3. National costs are likely to be more accurate than area costs because of the geographical fragmentation of company-wide costs required by area costing. Even where the company has local divisions, costs are interrelated and many costs are common.

4. Much information and many factors to be considered are more available on a national than on an area basis. Thus the growth allowance for the country is related to the needed future national R/P ratio. But there is little evidence here of the appropriate future R/P ratio for Permian gas. Such a factor could only be determined in relation to all the other areas from which the West Coast draws its supplies.

5. The principal economists for Respondents, Distributors and Staff, Dr. Foster, Professor Kahn, and Professor Wein all testified that costs should be determined on a national basis. No economist testified to the contrary.[12]

6. All parties agree that exploration and development costs should be determined on a national basis. This is necessary to take account of dry hole costs incurred outside the specific areas enumerated by the Commission, exploration in new areas such as Florida, Oregon, etc. Thus the Staff's historical costs are a synthesis of national exploration and Permian production costs. The same is true for CPUC witness Doran's cost of new gas well gas.

7. The only estimate of the cost of Permian new gas well gas, that of the CPUC, is not acceptable as an estimate of the separate cost of this gas. Doran's estimate is analyzed in detail in Appendix A, p. 376. The major reason why it cannot be used as an estimate of the separate cost of new gas well gas is that it is largely based on Staff's allocations of the joint costs instead of being an independent determination of new gas well gas costs. Thus Doran's results reflect Staff's allocation of exploration and development expenditures (E&D) to gas well and gas condensate well gas by the modified Btu method; his allocation of production operating expense, return, and depreciation, depletion and amortization (DD&A) allowance between liquids and gas from the condensate wells is governed by the results of Staff's relative cost method. These Staff allocations produce results which may be equitable divisions of the joint costs. But, as will be explained in Appendix D where the Staff costs are discussed, so far as determining the separate economic cost, they are fictions. Doran's reliance on Staff's allocated data is so great that his results are too far removed from an economic cost determination for new gas well gas to be acceptable.

We turn therefore to the determination of the current economic cost of gas well gas on a national basis. There are three current national cost studies for gas well gas, those by Respondent witnesses Sherwin and Park, and by Distributor witness Roseman.

Dr. Sherwin relates all costs incurred during a year (which are termed expenditures) to production for that year. He treats all these expenditures as current expenses whether they are typically capitalized or expensed. These

[12] The only witness who testified in favor of using area costs as the point of departure in determining prices was CPUC witness Doran who is a rate engineer. The Staff witnesses presented area costs exhibits, but they did not present any testimony supporting the use of area instead of national costs.

expenditures are related to current production of gas, not reserves added. Consequently, the study does not show the cost of providing new gas supplies, but only an artificial relationship between current expenditures and gas currently sold. Sherwin's study is based on the hypothesis that in the course of the year, the producer will receive back all the expenditures he has made during the year; hence there is little justification for a return element; nevertheless, a return margin on expenditures of from 13 to 15 percent for cash dividends is allowed. His study does not reflect the traditional accounting method used by the industry for treatment of capital. Also many of the items he uses are close or similar to those used in the presentations of Park and Roseman, which represent the major presentations on this subject by Respondents and Distributors. In the interest of clarity attention will be focused on the exhibits of witnesses Roseman and Park, although note will be taken of a few special items in Sherwin's estimates.

Distributor witness Roseman presents a computation of the national industry wide average unit cost of 1960 levels of finding and producing new reserves of gas well gas. He relies on the general industry accounting practice, whereby exploration and development expenditures (E&D)[14] are charged off as current expense, and production investment is capitalized.

Respondent witness Park presents an estimate of the financial requirements of the cost of financing new supplies of gas well gas on an industry basis. He capitalizes all E&D expenses, although this is not customary in the industry. The basic difference between the Roseman and Park studies lies in their respective treatment of capitalized items and the return on capital. Roseman illustratively applies the Staff's 9½ percent rate of return to his capitalized costs. Park applies a discount rate of 10 percent to his equivalent of Roseman's capitalized costs plus the E&D which he also capitalizes. Initially, it will be useful to analyze Roseman's estimates comparing these with the corresponding estimates of Park, leaving till later Park's special treatment of E&D and certain other aspects of the capital problem.

The studies of Roseman and Park differ from Staff's historical cost of service study. The latter uses the average historical investment for the capital costs, regardless of vintage. The current cost studies of Roseman and Park deal with current costs as a measure of the current requirements of producers for finding additional gas well gas supplies. These studies are concerned only with recent cost incurrence and the recently experienced gas productivity because that is deemed reasonably representative of what the average cost will be for supplies brought forth in the near future. Roseman and Park are seeking not 1960 cost figures, but a normalized estimate centering around 1960 which will reflect the average expectation of cost for this period and the near future. Of course, such an estimate would remain valid only to the extent that there are no significant changes in future costs of finding and producing reserves.

The second difference is that the Roseman and Park studies are concerned with determining the cost of gas well gas additions. Lacking direct data for certain items they resort to estimating techniques, generally relating the known to the unknown by establishing certain normalized relationships. For example, Roseman and Park estimate lease acquisition costs and investment in other production facilities by determining the relationship of these items to successful well drilling costs. In their expert opinion, the relationship is indicative of the respective costs. The results are an estimate—but an estimate of cost. In contrast, the Staff cost of service presentation is the product of successive allocations of joint costs the results of which are remote from economic cost.

[14] E&D includes principally dry hole expenditures, geological and geophysical expenses, and lease rentals. Production investment includes successful well costs and lease facilities.

B. THE COST OF NEW GAS WELL GAS

In this section a computation is made of the national industry-wide average unit cost at 1960 cost levels of finding and producing new reserves of gas well gas. For convenience of analysis all costs will be expressed in cents per Mcf.

The cost estimates that are adopted below are based largely an a study of the estimates for new gas well gas costs by Distributor witness Roseman and Respondent witness Park. In the main, the analysis and the conclusions follow that of the Distributor witness. His study follows the customary industry accounting practices of expensing exploration and development expenses; his analysis is based on the theory that funds for exploration at any given time are derived from then current production. Park capitalizes his exploration expenses; his model is based on the assumption that the cost of current exploration should be borne largely by future gas production. This is not the usual industry accounting practice. The items comprising the respective specific cost estimates of Park and Roseman are examined in detail in Appendix B. The conclusions regarding the estimates for specific items are presented below. The table on the following page summarizes the estimates of these two witnesses and the estimate which the Presiding Examiner adopts. The major items in the analysis are:

1. Capital recovery charges. These production investment costs cover the tangible and intangible costs of successful wells, lease acquisition costs, and the cost of other production facilities. It is customary in the industry to capitalize these charges, for they represent long-term investment in the industry and produce revenues over time. This capital investment is recovered annually through charges to depletion, depreciation and amortization (DD&A), on a unit of production basis. Thus for each Mcf of gas produced, as shown on the table, the DD&A charges will amount to 3.95 cents.

2. Return on capital. In this analysis it is estimated that the reserves are depleted at an even rate over a twenty-year period. On this basis, the average net investment in the unrecovered capitalized costs per Mcf of gas produced would be 10 times the gross investment per Mcf of reserves added. Pending the recovery of capitalized costs through DD&A charges as the gas is produced, the capitalized items earn a return. The average investment per Mcf of gas produced is 3.95 cents $\times$ 10=39.50 cents. It is determined below that the return on investment in this proceeding should be at the rate of 12 percent and that this return should be allowed for a period of twenty-one years to account for the depletion period plus a one-year lag between productive investment and the initiation of revenues. Hence the return on fixed investment per Mcf produced is 5.21 cents. The return on working capital at 12 percent is 0.20 cents, making a total return allowance of 5.41 cents.

3. Production Operating Expenses. This item covers direct and indirect operating expense related to current production and is estimated at 2.88 cents per Mcf.

4. Exploration and Development Expenses. Exploration and development expenses (E&D) include geological and geophysical expenses and lease rentals at 1.05 cents, dry hole costs are 1.42 cents, and exploratory overhead at 0.54 cents, totaling 3.01 cents per Mcf.

E&D expenses are customarily expensed by the industry. As they are incurred each year they are charged against current production. But demand is growing, and over the years a greater amount of reserves must be found than an amount needed merely to replace current production. Hence exploration outlays must be at a rate which takes account of this growth. It has previously been determined that a national life index of 17.5 years by 1970 will be satisfactory. To achieve this result, annual reserve additions as shown by Roseman have to be 1.37 times annual production until 1970. Hence the E&D expenses must be

Current national cost of new gas well gas

	Respondents	Distributors	Examiner
Production investment costs:	*Cents*	*Cents*	*Cents*
Successful well costs	3.10	2.88	2.88
Lease acquisition costs	1.24	.76	.76

Return	8.45	3.90	5.41
Dry holes and other exploratory costs	3.12	3.00	3.01
Allowance for growth	2.15	1.11	1.11
Royalty and production tax	4.33	2.79	3.06
Other	.54	.64	.34
Total	23.24	15.39	16.88

[1] *Respondents*—Carrying Cost at 10% compound interest on all finding and development expenditures. *Distributors*—Return at 9½% on average investment and working capital. *Examiner*—Return at 12% on average investment and working capital. (Return on average investment adjusted to reflect one-year lag.)

[2] *Respondents*—Net lease credit from Exhibit 250 plus stipulated 0.2¢ plant credit. *Distributors*—Gross lease credit from Exhibit 224 reduced by 12½% royalty and 5% production tax, plus 0.2¢ plant credit. *Examiner*—3¢ gross lease credit reduced by 12½% royalty and 5% production tax, plus 0.2¢ plant credit.

[3] Staff estimate.

[4] *Respondents*—7% on ⅞ net working interest. *Distributors and Examiner*—6.42% on ⅞ net working interest.

increased 37 percent to cover the required growth. This additional cost is termed the "allowance for growth", and amounts to 3.01×37 percent=1.11 cents per Mcf.

5. Liquid Credit. In addition to the revenues to be received from the sale of the gas, the producer of gas well gas can expect to receive revenues from lease condensate and from plant liquids estimated to average 2.68 cents per Mcf after royalty and production tax. After crediting the liquid revenues, the balance plus an allowance for regulatory expense, royalty and production tax, represents the total current cost of new gas well gas.

6. Regulatory expense. An allowance of 0.14 cents per Mcf is made.

7. Royalty and Production Tax. Royalty at 12.5 percent of the selling price must be paid to the lease owner and this item is treated as a cost, 2.11 cents per Mcf.

The average Permian production tax rate in effect at the close of 1963 was 6.42 percent which results in an allowance of 0.95 cents per Mcf. No federal income tax is allowed because the gas production industry does not pay federal income tax on its gas production.

The national cost of new gas well gas is thus determined to be 16.88 cents per Mcf.

C. THE RATE OF RETURN ON THE PRODUCTION INVESTMENT IN NEW GAS WELL GAS

We turn now to the question of the rate of return on the production investment in new gas well gas. This investment includes the cost of successful wells, lease acqusition costs, and the cost of other production facilities. The rate of return being considered here is the appropriate rate of return on capital invested in finding new gas well gas, which it has been previously determined can to a

considerable degree be found by a directional or directed search for this gas as such.

Only Staff and Respondents presented evidence on rate of return. The Staff proposes a rate of 9.5 percent on all gas. The Staff, it will be recalled, rejects the directional hypothesis. The CPUC and the Distributors accept the directional hypothesis and also recommend that the Staff rate be adopted in computing the return for new gas well gas as well as for all other gas. Respondent witness Morton proposes a rate of 16–18 percent for all gas. Respondent witness Park also presents evidence on return based in part on capitalizing the E&D expenditures which are normally expensed. This second presentation will be discussed after the analysis of return on the traditional basis is completed.

Rate of return deals with the earnings the investor expects to receive on the capital he invests in the enterprise. The two major standards for determining the rate of return have traditionally been:

1. The capital attraction standard. The return should be based on the anticipated cost of obtaining or retaining the investor's capital.

2. The comparable earnings standard. The investor should have an opportunity to earn what he would reasonably expect to earn in other businesses or industries of comparable risk.

Rate of return concerns the future, what prospective earnings the investor should have an opportunity to earn from capital he embarks in the enterprise. The method of analysis both for the capital attraction and the comparable earnings standards considers the results of the present and the recent past; but the purpose is to evaluate the future on the basis of the present and recent past: to estimate the probable future cost of capital, or the reasonably anticipated earnings of comparable industries.

With regard to the capital attraction standard, Dr. Shaffner for the Staff, relying on a study of the Chase Manhattan Bank, indicates that the cost of equity capital for the petroleum industry declined some 1.5 percent between the period 1951–1955 and 1956–1960, from about 8–10 percent to approximately 7 percent. If the traditional earnings-price ratio method for determining the cost of capital is considered, the earnings-price ratio for the petroleum industry for the years 1956–1960 inclusive was 6.8 percent. This is evidence of the then current cost of equity capital, though the capital attracting rate of return may be above or below the earnings-price ratio, depending on whether investors are anticipating higher or lower earnings in the future. The petroleum industry largely generates its own capital from depletion and depreciation allowances and retained earnings.[15] Thus the cost of equity capital is to a considerable extent the cost of retaining earnings in the industry, rather than the cost of obtaining new capital from outside investors. For this reason, in using the earnings-price ratio method of determining the cost of capital for the industry, it is questionable whether it is appropriate to make allowances for flotation costs or discounts for market pressure in connection with floating new issues of stock. The basic evidence of the capital attracting rate is thus 6.8 percent for the industry. Whether and to what extent a premium ought to be added to take account of the factor of investor anticipations regarding future earnings cannot be determined from this record.

However, both the Staff and the Respondents rely on the comparable earnings standard to derive their rate of return. Using this standard, the Staff rate

[15] The generation of capital to a substantial degree from internal sources has been a common feature of large scale American corporations, except for utilities, during the post war period. See *Economic Report of the President*, 1964, p. 285, Table C–66, indicating that, of the funds obtained by United States corporations (including utilities) between 1952 and 1963, some 24 percent were from external sources and some 76 percent from internal sources.

is derived as follows: A selection was made of all producers selling two million Mcf or more to interstate pipelines in most years, which have issued stock held publicly and traded in recognized markets, and which regularly issue public reports on their earnings. Twenty-six integrated [16] companies and nine non-integrated companies meet these standards. The years 1957–1961 were selected as representative of a recent period since they reflect the high returns for 1957, the low returns for 1958 and three average recent years. The results for the 35 companies for the five-year period show that the average return on capitalization weighted by the companies' average 1960 capitalization was 9.3 percent. The average earnings on capitalization for the non-integrated producers on the Staff list for the period 1957–1961, weighed by their 1960 capitalization, were 12 percent.[17]

The capital structure of the industry is a relevant factor in considering the rate of return, for it determines the proportion of total earnings that go to debt and to equity. The capitalization of the petroleum industry is substantially equity with a low debt component. The percentage of debt to total capitalization for the industry has been decreasing since the peak of the oil boom in 1956. The integrated companies on the Staff list have an average debt of some 15 percent, while the debt of the non-integrated group averages 17 percent. Respondent witness Scott's study shows that 12 percent is more typical for the non-integrated producer. A consequence of the low debt of the petroleum industry is that there is little apparent leverage in its capitalization, particularly in comparison with a pipeline where the debt component, sometimes as large as 70 percent of total capitalization, permits trading on the equity. The capital structure of the petroleum industry resembles manufacturing rather than pipelines or electric utilities. On the basis of the average capitalization of the companies in the Staff list, an overall return of 9.5 percent will return approximately 10.5 percent on equity, and an over-all return of 12 percent will yield some 13.5 percent on equity.

The Chase Manhattan Bank in its annual study *Financial Analysis of 33 Petroleum Companies—1962* points out that various industry practices provide capital comparable to debt in giving leverage to the equity capital of producing companies:

> At the end of 1962 the Group's ratio of debt to total capital employed was 13 percent—the lowest since 1946. The 5.1 billion dollars of stated debt does not, however, include capital made available for the Group's benefit through the means of long-term lease rentals and production payment loans. From incomplete data currently at hand it is estimated that the Group's debt would be almost double the stated amount if these additional sources of financing were included. On that basis, the ratio of debt to capital employed would be close to 25 percent. The Group is also contingently liable for guaranteed loans and other obligations amounting to approximately 525 million dollars. [At pp. 19–20.]

[16] Integrated companies are those which engage in the refining, processing and the distribution of petroleum products, in addition to finding and producing oil and gas. There are no large companies which produce oil exclusively or gas exclusively .

[17] Dr. Shaffner defines his Group I companies as "principally producers of gas and oil." Their weighted average earnings during the five years 1957–61 were 12 percent. Two of his nine companies derive a slightly greater percentage of their revenues from gas gathering activities than from oil and gas production. If they are omitted, the earnings of the group will be increased 0.2 percent. The two companies are non-integrated companies, since they do not refine or market their products. The major financial difference between these two companies and the other non-integrated companies lies in the greater percentage of debt in their capitalization. The inclusion of these two companies increases the percentage of debt of Dr. Shaffner's Group I companies from 12 percent to 17 percent. However, witness Scott's estimate of 12 percent debt for non-integrated companies has been adopted for this purpose.

Witness Scott's testimony suggests that these practices are used by petroleum producers other than the 33 companies in the Chase Manhattan study.

Another factor is the dominating position of the integrated companies. They produce the bulk of the gas. As Respondent witness Morton says, "the typical oil and gas producer is, of course, the large integrated company." (168/19,810.) In Permian the integrated companies sell 70 percent of the estimated amount sold to interstate pipelines. To an even greater extent the integrated companies are the predominant factor in the Staff earnings study. This results from the fact that a good proportion of the integrated companies meet the standards for inclusion in the Staff list: they sell two million Mcf interstate, have stock publicly traded on recognized exchanges, issue regular annual reports; whereas only nine of the thousands of non-integrated producers meet these standards. As a result, the weighted average return for both the integrated producers and the combined integrated and non-integrated producers is the same, 9.3 percent.

It is probably impossible to use the earnings of the production departments of the integrated companies as a basis for determining the earnings of the oil and gas producing industry. Intracorporate sales of oil reflect company policy, market strategy, and tax considerations. No party proposes using the earnings of the production departments of the integrated companies, and there is no data on this subject in the record.

The Staff recommends that the comparable earnings standard be determined from the weighted average earnings of the integrated and non-integrated producers on its selected list, where the size of the integrated group counts heavily. The earnings of the petroleum industry itself are thus used as the standard to determine the appropriate earnings on gas production. This avoids the difficult problem of comparing the risks and earnings of other industry groups. However, it raises the question of the use of the over-all earnings of the integrated companies to determine the appropriate earnings for gas production.

Basic to the Staff proposal is its view that: Gas is found largely as a by-product in the search for oil; and the rate of return serves little function in eliciting supply. The problem is largely one of determining a "fair rate." Thus, Staff witness Shaffner states:

> * * * this rate is, in my opinion, arrived at from the point of view primarily of fairness, in providing a return on oil-well gas which is produced primarily as a result of the production of oil, it is assumed that if there was any incentive involved in drilling a well, there was an incentive to drill for oil rather than for gas.
>
> Now as to gas well gas, the question depends on these contingencies I have developed towards the end of my testimony, and there is a question in my mind as to whether that is something the industry can find if it wants, or if this is something which they may happen upon accidentally when drilling for either oil or gas, whichever they happen to find in an exploratory sense. . . .
>
> * * * since this is geared primarily to oil well gas, that is, gas which results from wells that are producing primarily oil, or in the alternative, to gas in general, if it be assumed and established that the industry is unable to direct its exploratory drilling to finding either oil or gas on the basis of a prior determination that they know what they are going to find when they prepare to drill. . . . (133/13,758–60.)

Dr. Shaffner recommended a return of 12 percent, the earnings of the non-integrated producers, for new gas well gas. if it were determined that gas well gas could be searched for directionally and if it were determined to be "in the public interest to provide a 'gas production inducement' rate of return in excess of the fair rate of return needed to attract capital." However, Staff seems to have abandoned this proposal on brief, in consonance with its view that the search for

gas well gas is not significantly directional and that the price of gas cannot significantly affect its supply. The Staff's final recommendation is therefore a rate of 9.5 percent.

The other Staff arguments in favor of using the earnings of the integrated companies as the essential standard are that the integrated companies produce the bulk of the gas; the investor can invest only in the whole integrated company; and so his risk is diversified among the various company operations;[18] the return of 9.5 percent is high in relation to the return on most utilities; and finally that it is taken as "axiomatic that other things being equal, the rate of earnings experienced by the going petroleum industry indicates at least an adequate return for any part of the industry." (Brief, p. 410.)

There are several objections to the Staff's inclusion of the integrated companies in determining the comparable earnings standard. First, there is little evidence of comparability between the average of the risks and operations of integrated companies—refining, petro-chemicals, marketing gasoline—and the risks and operation of finding and producing gas. Second, there is no evidence that integrated companies earn at the same rate for their various operations. Third, it has been determined that gas well gas can be found by a directional search and that the supply of gas well gas, while not elastic, will be influenced by its price. If the return from gas well gas is less than the return from oil, producers will be induced to slant their search for oil compared with gas; also if the return from gas well gas is insufficient, producers can refrain from searching for gas, to a considerable extent. Thus the rate of return for gas well gas must be enough to induce the partly separate search for gas. For this purpose the average earnings of the integrated companies are economically irrelevant.[19] The Staff's inclusion of the returns of the integrated companies in the comparable earnings standards is therefore rejected for the instant purpose.

Respondent witness Morton's presentation is partly statistical and partly based on his analysis of the nature of the risk of the industry. His conclusion is that the appropriate rate of return should be 16–18 percent.

Dr. Morton first considers the average rate of return earned by various industry groups for the years 1947–1961 inclusive. The averages for this period are unduly influenced by the abnormally high earnings experienced by most industries immediately after World War II and during the Korean War period due to shortages and inflated demand. The earnings of the petroleum industry during the years 1947–1957 were higher than its earnings before or since, as shown by the history of the earnings of the industry from 1925–1961. The period after 1960, which is the period for which earnings are being projected, can reasonably be expected to reflect lower and more stable earnings. This is indicated by a comparison of the earnings on capitalization for the most recent five-period compared to the earnings for the period 1947–1961 for several of Dr. Morton's groups, which is shown below:

Group	Percent of return 1947–61	Percent of return 1957–61
FPC Class A & B electric utilities	6.0	6.1
FPC pipeline companies	6.3	6.3
Fortune's 50 largest manufacturers	11.8	9.7
Fortune's 50 medium size manufacturers	12.0	9.4
13 oil and gas producers (non-integrated)	18.1	14.5
Chase Manhattan 33 Petroleum companies	11.9	9.6
14 Petroleum refiners	11.2	8.3

[18] Natural gas does not pass through the gamut of an integrated company's operations as, it is arguable, is the case with crude oil.

[19] In the *Phillips* case the Commission considered the earnings price ratios of the integrated and non-integrated companies, but the underlying principle in *Phillips* was that the search for gas was substantially non-directional.

The earnings for the full period 1947–61 are higher than those for the recent period 1957–1961 because of the distorting effects of the high earnings during the earlier years. Also Dr. Morton's exhibit shows that there was a steady downward trend in the earnings of the industrial group from 1947–1958, after which earnings leveled off. Consequently the 1947–1961 averages used by Dr. Morton are not representative of a recent period and are not a sound basis for predicting earnings in the near future.

Dr. Morton's group of thirteen oil and gas producers does not purport to be a representative sample of non-integrated producers. They were selected by Dr. Morton and his associates, who tried to include some small and some large producers, but "the main consideration was the availability of data." As Dr. Morton states:

> But when we deal with oil and gas producers, we are dealing with a relatively small number of companies that are constantly being diminished. The typical oil and gas producer is, of course, the large integrated company. They do most of the oil and gas production, but we do not have a breakdown of their earnings from the viewpoint of gas production and oil production and other types of operations which would require allocation, so we used the 13 small oil and gas producers not because they are the best representatives of oil and gas production in the United States, but because it was practically the only information available that did not require allocation. (168/19,810.)

Also for the critical recent period, Dr. Morton's group of thirteen is not even a sample of identical companies: there is no 1960 data for one company and no 1961 data for four of the companies, because they were acquired by integrated companies.

Dr. Morton also shows earnings on equity for a selected group of non-integrated producers, supplied privately to him by the First National City Bank. Dr. Morton did not know the basis for the selection. These figures show return on beginning year equity for the period 1947–1961. The arithmetical average for the entire period is 17.4 percent. The rates for 1947, 1948, and 1949 were 19.9 percent, 35.9 percent, and 21.7 percent; after that they decline. The number of companies in the group varies from 71 to 88 for the years 1957–1961. For this later period, the average return on beginning year equity is 13 percent. On the basis of Respondent witness Scott's testimony of an average of 11.6 percent debt ratio for non-integrated producers, this translates into approximately 12 percent return on total capitalization. If an adjustment is made for average instead of beginning year equity, the rate is slightly below 12 percent.

In the extensive collection of data on earnings presented in Dr. Morton's exhibits, there is a single instance of earnings on capitalization as high as 18 percent: the average earnings of this 13 non-integrated companies for the years 1947–1961. This is an unrepresentative sample for an unrepresentative period. There is only one other case of earnings on capitalization as high as 15.5–16 percent. This result may be inferred from the results of the First National City Bank study for the period 1947–61.

On brief Respondents emphasize the results for these two groups to support their conclusion of a 16–18 percent return. This contrasts with Dr. Morton's reiterated refusal to stress these particular results. Thus he indicates that the 18.1 percent average return for his group of thirteen companies was not a crucial factor in his recommended rate of 16–18 percent. Its contribution is similar to that of his other data and its particular significance is stated to be largely that of an indicator of a downward trend in earnings:

> Every figure contributes something. It is used as part of my judgment, but the important thing here, again, as I have indicated, is that in recent years the rate of return has been down. * * * (168/19,805.)

Dr. Shaffner's selection of non-integrated companies does not involve the same degree of judgment that was used in making up Dr. Morton's list. Dr. Shaffner set definite standards: companies selling 2 million or more Mcf annually, publicly held, traded on recognized stock exchanges, issue annual reports. He included every company that met these requirements. There were nine such companies, eight of which sell interstate over 10 million Mcf annually. The average return on capitalization for this group for the most recent five-year period 1957–61 was 12 percent, which is in consonance with the First National City Bank results.

The earnings of Dr. Shaffner's group of nine non-integrated companies are probably not typical of non-integrated producers, or of small producers who are of course non-integrated. The nine producers whose stock is traded on the stock exchanges are an unusually successful group of non-integrated producers whose success has permitted them to become public companies listed on major stock exchanges. This conclusion finds support in Respondents' Exhibits 254, Schedule 7, and 255, Schedule 4, which analyze revenue and capitalized investment data for the year 1960 from the Staff questionnaire. These exhibits show that the ratio of net revenues to net capitalized investment was about one-third as much for the Respondents selling under 10 million Mcf compared to those selling over 10 million Mcf—4.0 percent vs. 15.0 percent. The absolute numbers reflected in these ratios are not comparable to earnings on capitalization. But the relative values of the two ratios suggest that the small producers are earning less than the large producers and that the earnings of the three groups of non-integrated producers, Dr. Morton's thirteen, the First National City Bank list, and Dr. Shaffner's list of nine, are not representative of small oil and gas producers selling under 10 milliion Mcf annually. This conclusion is consistent with the testimony of the small producers, such as Scott Hammonds, that their earnings have been low in recent years (though the reason would appear to be the oil glut rather than a decline in the price of gas). The Staff Appendix includes the results for 1960 for approximately 136 companies including some 94 selling less than 10 million Mcf annually. These results may not be representative of the earnings of small producers. But they are hardly less representative on this score than the earnings shown in the other three selected lists of non-integrated producers.

With regard to the comparable earnings standard, it is concluded:

1. The over-all earnings of the integrated companies are not relevant for the purpose of determining the return of directionally found new gas well gas.

2. The earnings of the production departments of the integrated companies are not usable, and there is no evidence regarding them.

3. The over-all earnings of the non-integrated producers are the relevant earnings.

4. No representative group of non-integrated producers has been presented.

5. The standards for selection of Dr. Shaffner's group of non-integrated producers are known and objective, and all companies meeting these standards were included.

6. The earnings of this group are higher than those of the typical non-integrated producer.

7. The best evidence in this record regarding the earnings of non-integrated producers is the 12 percent average earnings on weighted average capitalization for the years 1957–61 for Dr. Shaffner's group of non-integrated companies.

Turning now to the intangible factors connected with rate of return, Respondent witness Morton states that:

> The special or unique risk of the gas producing industry is the exploratory risk. It is the risk created by the lack of predictability between input and output, both in physical and value terms. (137/14,476.)

Respondents argue that this risk should be reflected in a rate of return from 16–18 percent.

Dr. Morton's first proof of the unpredictable relationship between imput and output in the industry is a study of the ratio between new field wildcats and total dry holes drilled as new field wildcats for the years 1945–61. He also makes the same study for all exploratory wells. Inspection of his Exhibit 220, Schedule 7, shows that the ratios are stable. The success ratio has been consistently about one out of nine for wildcats, and about one out of five for all exploratory drilling.

Dr. Morton then shows the cash outlay per million Btu's of oil and gas reserves added. Since the problem in this case concerns gas, the emphasis should be on gas; measurement in terms of Btu's of oil and gas combined is not significant. Also aggregating gas and oil in the form of Btu's of itself introduces additional elements of variability: the product mix between oil and gas is not the same each year; and the validity of the method subsumes that the cost per Btu of gas and oil is the same. In any event Dr. Morton's table shows that while the results for particular years vary, the average of a series of years is not unstable: the average for the five years 1952–1956 is 11.6 cents per MMBtu; for 1957–1961 it is 11.9 cents. Respondent witness Cram uses five-year averages of this same data to indicate cost trends, indicating he believes they are sufficiently stable for statistical comparisons.

Finally, Dr. Morton shows a table indicating annual variability between dollar outlays per million Btu's of gas and oil for seven companies. The companies do not purport to be representative and the exhibit is entitled to little weight.

On brief Respondents also argue that "Reserves added by a given exploratory and developmental effort fluctuate widely over time . . . . (Brief p. 90a). Respondents then compare the reserves added in certain high years with other low years. But the results referred to by Respondents are irrelevant as proof of the proposition cited above because they do not relate the reserves added to a "given exploratory and developmental effort." And if the exploratory and developmental effort is to be related to gas reserves added, the appropriate measure of reserves added, for this particular purpose, would be the new discoveries rather than the total findings, the majority of which consist of extensions and revisions, which involve substantial corrections for previous years. Also an appropriate series of years and a proper measure of the exploratory and developmental effort would be necessary. These elements are lacking in Respondents' comparison.

Respondent witness Porter places the problem of the risk of unpredictability between effort and output in perspective. So far as the chances of success are concerned, the results of drilling any one well or the results of the efforts of a company that drills a few holes per year are unpredictable. For the industry as a whole over a series of years, the results are reasonably constant and predictable because here one is dealing with large numbers which tend to average out. Thus Porter points out:

> The risks of an individual company may vary considerably from the risks of the total industry. A single company, because of limited funds, may be precluded from achieving over-all industry average success ratios merely because it may exhaust its funds before it can approach a program anywhere near an industry average of experience. . . . The relationship of results to

> the amount of finding effort for individual companies is erratic whereas for the industry as a whole some fairly consistent relationships exist. This is true because of the magnitude of the total industry's undertaking and because of the group nature of the effort. . . . During the years 1956 to 1960 the entire industry has drilled between 11,704 and 16,173 exploratory wells per year. I understand that no one company drills more than two or three percent of those wells. Of the total exploratory wells drilled in those years, the successful wells in terms of achieving some production ranged within the narrow limits of 18.7 percent to 19.8 percent. Stated another way, the number of dry exploratory wells for each producing well was between 4.04 and 4.35 wells. Footage of exploratory wells drilled indicates the same consistency in results on an industry composite basis. . . . The individual company results range from complete failure to more successful than the industry, depending upon the luck or skill of the individual company. . . . This wide range of possible reserve additions leads me to believe that there is not necessarily a consistent relationship of an individual company's results to its effort. However, for the entire industry there do seem to be some consistent results to effort in relationships. (158/17,392 *et seq.*)

Thus the results of a single effort or a small number of efforts may well be erratic either measured in terms of successful wells drilled, or in terms of reserves added for successful wells. But the average results of the industry's activities measured over several years are predictable. For the industry there is a fairly consistent efforts-to-results relationship over time.

What is true for the industry is also true for the larger companies though to a lesser degree. The larger the company the more its results will tend to approximate those of the industry.

The risk of the individual producer may be viewed as partly subjective in that it is a function of the ability of the person subjected to the risk to sustain the risk until such time as he can achieve average results. The history of the large producers indicates that over time they have been uniformly profitable. No major producer has undergone the experience of Studebaker in recent years.

The nature of the risk is quite different for the small producer because he may not be able to continue operations until he achieves average results. Even here it should be noted that small producers do not customarily put all of their resources into drilling a single hole. They are skillful in sharing risks and dividing their resources among a number of operations. Not only do wildcatters share their risks with each other, but they frequently share them with outside investors in high income tax brackets who are risking, to a large extent, dollars which would be subject to high tax rates. Nevertheless, the nature of the risk of the individual wildcatter is of a different order than that of the large producer. It is partly for this reason that the decision is made in Part IV herein to create a separate class of Small Producers.

With regard to elements such as dry holes and wells which while technically successful do not yield gas in commercial quantities, the industry wide method of pricing gas well gas takes these factors into consideration by aggregating industry costs and setting a price under which aggregate industry revenues will cover these costs. Treated as part of industry costs and revenues, these factors do not involve substantial industry risk, so long as the industry is reasonably sure of having income against which to charge off exploratory losses. Therefore, it would be improper in determining the industry return to consider factors such as dry holes and low yield holes as an extra element of risk because they have already been included in the industry costs and revenues.

In comparison with other industries, gas production enjoys several favorable features.

Producers do not generally pay federal income tax on their gas production. This doesn't necessarily mean the industry can keep the resulting profits; under competitive conditions these would tend to be dissipated in lower prices along the line. But the industry need only earn 12 percent to net 12 percent instead of having to make some 24 percent before taxes to net 12 percent, as is true in most other industries. The lower target necessary to achieve equivalent results reduces the risk; it also reduces chances of variability in net earnings.

The demand for gas has been growing so rapidly that in general there has been little marketing problem in recent years for gas which is accessible to a pipeline or a processing plant.

In comparison with oil, two factors favor gas well gas production. First, gas is sold under long term contracts which provide an element of stability in comparison with oil. Thus gas reserves for which a long term sales contract has been negotiated are regarded as a more bankable security for loans than oil reserves. Second, prorationing limits the earnings of oil and gas from oil wells, and reduces the asset value of oil investments. Current prorationing limiting production to some ten days a month reduces earnings by approximately two-thirds. Gas well gas is only slightly affected by prorationing. On the other hand, gas is subject to the offsetting factor of FPC regulation.

Consideration of these various intangible factors does not indicate factors unfavorable to gas sufficient to warrant returns above those earned by the oil and gas producers. Accordingly, it is concluded that the rate of return should be 12 percent for new gas well gas.

D. LAG AND THE PERIOD OVER WHICH RETURN IS ALLOWED

In Distributor witness Roseman's model exploratory costs are treated as expensed in the year incurred. Since these E&D items are expensed there is no problem of lag between the time of their outlay and their recovery. Roseman capitalizes the production investment costs, which are generally capitalized by the industry. These are recovered through amortization charges (DD&A) over the life of the contract, twenty years. This is the equivalent of a depletion rate of 1 Mcf per day for each 7,300 Mcf of reserves, which is a common rate in the industry. Respondent witness Park uses a depletion rate of $\frac{1}{8000}$ which is equivalent to a twenty-two year depletion period. Neither Roseman nor Park gives strong reasons for his respective selection. No great criticism has been levelled at the use of either period. It is reasonable that the depletion period selected should coincide with the term of the contract which is typically twenty years. Accordingly, a twenty-year depletion period is adopted.

Is there a time gap between the outlay in the productive investment and the initial receipt of income from the investment? Roseman makes no allowance for such a lag. But if there is a time lag, it represents a cost for which an allowance must be made.

Roseman's capitalized costs represent a cross section of the industry's investment in a current year for finding and producing gas well gas. Two questions regarding time are raised with respect to Roseman's model: (1) Do production and revenue begin as soon as the investment is made? and (2) Is the entire investment completed before production begins?

Regarding the first question there is little specific data on the revenue lag associated with the investment in successful wells. Staff witness Lyon refers to four years as the average time lag between the beginning of exploration and the commencement of production, but he is referring to exploratory activity which includes expenditures for the earliest geological exploration and the first exploratory dry holes in an area, as well as the successful well investment which tends to come later. Respondent witness Hudson refers to a time lag of 3–5 years'

average; he also includes expenditures for both E&D and successful wells. Hudson's testimony was not supported by any study; it was only a rough estimate. Respondent witness Hinton states that contract negotiations for the sale of reserves may consume a year. Respondent witness Park, relying in part on Hudson, uses a three-year lag, but this lag also covers E&D as well as expenditures for successful wells. The testimony relating to the time lag involved in the investment in successful wells is general, vague and of little probative value insofar as it concerns a specific time period. The lag for successful wells is less than for E&D, but there is no definite evidence on the difference.

There is a waiting period after reserves are first discovered and the receipt of income. This period covers negotiations with the pipeline, construction of pipeline facilities, and the time required for certification by the Commission. For reserves produced from the initial wells in a field, this period can be longer than a year: for reserves added by later development, wells which are drilled after the main line is laid but which are covered by the original certification, the waiting period will tend to be short. Forty percent of the total outlays capitalized by Respondent witness Park are of the type expensed by the Distributor witness. If the over-all weighted lag is three years, the period Park uses, and if the lag on E&D is six years, then the lag on production investment will be one year. This conclusion and the assumptions on which it is based are reasonable.

Turning to the second question, whether the entire investment is completed before production begins, Roseman's model represents a cross section of total current industry expenditure in finding and producing gas well gas during a current year. The investment in successful wells includes all development wells and facilities that will be constructed in connection with the reserves which will be produced from the investment over the entire contract period of twenty years. In actual production conditions, during the course of the production period for the reserves, some development wells will be drilled primarily to increase deliverability, rather than to find new reserves; some equipment will be added that will relate to production for only part of the twenty-year period. Under Roseman's assumption that all development costs and all equipment costs are capitalized in advance of any production, it is evident that a return will be allowed for the full twenty-year period on some production investment that is used for only part of the twenty years. Thus a return is earned on these items for a longer period than appropriate. There is no way to estimate the extent of this extra return. It may be regarded as a kind of "negative lag," counteracting the positive lag during the period after the investment and prior to the receipt of income.

Taking the negative lag into consideration, it is concluded that an over-all lag of one year is proper.

There are four ways in which the cost effect of this lag can be handled:

1. It can be treated as inherent in the business, and as having been included in the allowed rate of return.

2. It can be regarded as similar to "construction work in progress" and an interest charge of some six percent allowed on the investment during the one-year period of lag.

3. The investment can be increased by a year's return on the investment at the appropriate rate of return, and the return allowed on the enlarged investment.

4. The return on the investment can be allowed for an extra year. The additional year's return is on gross investment as DD&A charges do not accrue until production begins.

Distributors contend that there is no net lag, and that in any event Roseman's exhibit reflects a one-year lag. In Schedule 10 of Exhibit 224 he uses a one-year lag in an illustrative study purporting to show that at a 9½ percent dis-

count rate, estimated future net operating income has a present worth roughly equivalent to his production investment cost. This study is the only place where he includes lag as a specific cost item. Respondents argue that there is a lag and that it should be computed in the manner of alternative 3 above, increasing both the capital investment and the return. Staff implies that there is a lag, but it argues that no allowance should be made for this lag because (a) it is wholly or partially offset by the negative lag, and (b) because Staff's historical cost of gas includes a return allowance on lag-reflective investments such as shut-in leases, undeveloped acreage, and incomplete construction. This latter point is valid only if Roseman's cost for new gas well gas is combined with Staff's historical cost for flowing gas well gas in establishing appropriate rate levels. If an allowance is to be made for lag, Staff argues that the proper method is alternative 4 above, increasing the return allowance to reflect a longer economic life of the investment.

Gas producers include undeveloped acreage in their asset accounts. Their books do not typically show a charge for waiting, not even the interest charge utilities make for "construction in progress." Hence it is arguable that the book return which has been adopted here reflects an implicit recognition by investors that this factor is included in the return. Analytically the situation resembles construction work in progress which has not yet been dedicated to the public interest. An interest charge is customarily allowed for this period for pipelines and electric utilities.

The problem of lag between the time of productive investment and the receipt of initial income was not raised at the hearing or on briefs. It was first explored in supplemental memoranda at the request of the Presiding Examiner. While the treatment of this item is not free from doubt, it is decided in the interest of conservative treatment specifically to allow for a one-year lag in computing the return allowance.

Lag does not increase the capital cost of the productive investment. It lengthens the period over which the dollars invested are recovered. Therefore full allowance for a one-year lag will be accorded by providing for a return for a twenty-one year period on the productive investment. The one-year lag does not apply to working capital as this allowance is not dependent on the economic life of the investment.

E. ALTERNATIVE METHODS OF DETERMINING THE RETURN ALLOWANCE

Respondent witness Park refers to earnings as the "carrying cost on finding and development expenditures." He says that the industry should receive net earnings of 8.45 cents per Mcf (after deducting 2.15 cents from 10.60 for growth). Park bases his return on a twenty-five year period, twenty-two years for depletion and a three-year lag. It has previously been determined that a twenty-year depletion period and a one-year lag are appropriate.

Park applies a ten percent discount interest rate to total finding and development expenditures to determine the cost of carrying reserves over their economic life. His reason is that he is relying on Respondent witness Terry. Terry testified that the industry must be afforded an opportunity to earn a discount rate or "true yield" of ten to twelve percent. By discount rate, Terry means a compounded interest rate which will equate future net revenues to present worth. He relies mainly on his judgment. Terry presents no studies of the industry cost of capital or of industry earnings such as are included in the Chase Manhattan annual publications with which he was associated for many years. He refers to the discount rate of eight percent which has been used in determining market value in certain sales of developed properties and argues that exploration is riskier and should earn more. In support of his judgment, Terry gives hypo-

thetical cases showing that, when the market value of a developed property is determined at an eight percent discount rate for an "ABC transaction," the anticipated yield to the operator who purchases the residual equity interest is estimated to be about twelve percent. He also refers to an actual 1956 ABC transaction where it was estimated that the purchaser of the equity interest will realize 11.6 percent.[39]

The risks and problems in dealing with future interests in a single project are different from the continuing processes of the gas industry's operations. In this industry, investment is continually occurring and producers are continually hedging by selling reserves for long-term contracts, continually exchanging past risks for future income; each transaction in the continuing process gives a chance for reappraisal in the light of then current factors, an opportunity which is denied the parties to a single long-term transaction. The industry's risks and operations are not analogous to those of an isolated purchaser in a single project.

Terry said that it was his "understanding" that the term "true yield" as used by Respondent witness Solomon "serves the same function as the term 'discount rate' in computing the value of producing properties." Solomon analyzed a series of hypothetical investment projects to show that a "true yield" on outlays can be less than the apparent yield on unrecouped investment where factors such as time lag and expensing instead of capitalizing occur, and where annual revenues are equal over the life of the investment. The true yield can also be greater than the apparent yield where growth is rapid, as it has been in the gas production industry, where wellhead revenues have increased from $344 million in 1949 to $1,790 million in 1960.

Respondent witness Solomon was unable to evaluate the various factors to show the true yield of the gas industry. There is no evidence that there is an actual disparity between the book yield and the true yield for this industry as it actually operates, or what the disparity is, if it exists. Regarding the usability of his true yield concepts, Dr. Solomon testified:

> Until somebody undertakes to find out what the true yield of this industry is, I can not tell if they are usable because I can not tell the problems that would be involved in ascertaining the true yield of the industry. They might be insolveable problems and therefore the true yield concept is only of theoretical interest or value. (169/20,040.)

With regard to Park's application of his proposed rate to both production investment and E&D, as has been pointed out earlier, it is general industry accounting practise to charge E&D expenditures against the revenues for currently flowing gas. Park's capitalization of E&D is a departure from general practise for which no warrant has been shown in this case.

The industry's books do not customarily include E&D in its assets or capitalization. The industry's earnings are not stated in terms of discounted revenues, or on the basis of some "true yield." Financial publications report the industry's book yield on its book investment and evaluations are made in the light of the many circumstances affecting the industry, just as for other industries. Return deals with the earnings investors receive from the enterprise. The standard adopted in this case is the actual published book earnings of a select group of oil and gas producers, twelve percent.

It is concluded that the appropriate rate of return is 12 percent on the average production investment and that on this basis the national average cost of new gas well gas is 16.88 cents.

---

[39] The accuracy of these estimates of yield, made at the time of the transaction, will depend upon the accuracy in estimating the proved reserves and the future net revenues to be realized over a period as long as twenty years. The yield on the equity interest for the 1956 transaction will not be known until 1976.

III. The Basis for Pricing Old Gas Well, Residue and Casinghead Gas

A. THE COST OF OLD GAS WELL GAS

It has previously been determined that the current national average cost of finding and producing new reserves of gas well gas is 16.88 cents per Mcf. This cost applies to new gas well gas, the gas well gas that will flow in future years from the reserves found in 1960 and thereafter.

We turn now to the determination of the cost of old or flowing gas well gas, which for purposes of this costing analysis will refer to gas well gas flowing in 1960 (and thereafter) from reserves found in the main prior to 1960.[21]

The cost for old gas well gas is determined here by its relationship to the cost of new gas well gas. For this purpose the cost items for new gas well gas are divided into two categories, finding costs and other costs. Finding costs are determined by relating the average cost of finding old gas to the average cost of finding new gas. For the other cost items the same costs for old as for new well gas are used because they reperesent current costs.

The method used for relating the cost of finding old gas well gas to the cost of finding new is described in detail in Appendix C page 389. The general procedure follows these major steps: (1) The total volume of gas well gas produced in 1960 is distributed according to its estimated years of discovery; (2) the volume associated with each year of discovery is weighted by an index of drilling cost per Mcf of reserves added for that year (1960=100); and (3) a weighted average finding cost is then derived for gas well gas flowing in 1960 relative to the cost of finding gas well gas in 1960. The result is expressed as a percentage of the finding cost of new gas well gas.[22]

The record contains two separate estimates of annual additions of gas well gas reserves, one by Dr. Foster, the other by Dr. Joskow. It also contains two indices of drilling costs per Mcf of reserves added, one by Dr. Foster, the other by Dr. Joskow. Since both these indices show the trend in cost per Mcf of reserves added, they tend to reflect changes in productivity as well as changes in the cost and price level. For this reason these indices are more significant than indices which merely show changes in cost level.

To determine the finding cost relationship between old and new gas well gas, two separate computations are made, the first using Dr. Foster's estimates of annual findings of gas well gas and his index of drilling cost per Mcf of reserves added; the second computation uses Dr. Joskow's estimate of the annual findings of gas well gas and his index of drilling cost per Mcf of reserves added. Using Dr. Foster's data and index, the average cost of finding gas well gas flowing in 1960 is approximately 69 percent of the cost of finding new gas well gas in 1960. Using Dr. Joskow's data and index, the average cost of finding gas well gas flowing in 1960 is approximately 74 percent of the 1960 cost of finding new gas well gas. A conservative conclusion is that the average finding cost of the gas well gas flowing in 1960 is 75 percent of the estimated 1960 cost of finding gas well gas.

The table on the following page shows the computation of the cost of old gas well gas. The finding costs (production investment and E&D) are derived by discounting these items for new gas well gas by 25 percent. A return of 12 percent is allowed on gross production investment for one year and on average production investment for twenty years. The 12 percent return is allowed on old gas, although when discovered some of it was considered an almost worthless product

---

[21] Gas flowing in 1960 typically comes from reserves found prior to 1960. These reservoirs will continue to flow until they are exhausted. The gas flowing from these old reserves in future years will also be old gas. The technical coverage of the term old gas will be discussed below in the section on Rate Design, Part V.

[22] *Cf.* 220/26,049.

and much of it was found as an incident in a search for oil, and although the price for committed gas does not serve the supply eliciting function that it does for directionally found new gas well gas. The current costs (production operating expense, liquid credit, regulatory expense, and working capital) are not discounted; these items are the same as those used in the cost of new gas well gas. The result is 12.82 cents as the national average cost of old or flowing gas well gas.

Examiner's national cost of new and flowing gas well gas

	New gas well gas	Flowing gas well gas
	Cents	*Cents*
Production Investment Costs	3.96	2.96
Return @ 12% with one-year lag:		
On average investment	5.21	3.91
On working capital	.20	.20
Exploration and development costs	4.12	3.09
Production operating expense	2.88	2.88
Net liquid credit	(2.68)	(2.68)
Regulatory expense	.14	.14
Subtotal	13.82	10.50
Royalty	2.11	1.60
Production tax	.95	.72
Total	16.88	12.82

The cost of old gas well gas determined here is the analogue of the cost of service used by Staff to determine the cost of all gas well gas, old and new. Under both the cost of service method used by the Staff and the cost method used here, current costs are combined with historical average investment costs.[23] The method used here is simple and relies substantially on publicly available data. Since it is based on estimates of real costs and real cost relationships, and since it minimizes the cost allocation problem, it is more meaningful as a cost than the results produced under the allocation methods employed in the cost of service studies of Staff and Respondents.[24]

The significant difference between the cost of old and new gas well gas under the costing procedures used here is that the finding cost of the new gas is based on the current finding cost and a reproduction cost rate base is used for the capitalized production; whereas for old gas well gas the finding cost and the rate base are based on historic cost.

The procedures here applied afford a simple and reasonable method for determining the historic cost of flowing gas well gas by its relation to the cost of new gas well gas. The cost used for new gas well gas is a reasonable estimate of its real cost. Thus the method provides a reasonable estimate of the real cost of old gas well gas.

B. BASIS FOR PRICING CASINGHEAD AND RESIDUE GAS

Casinghead gas as used herein refers to raw oil well gas sold directly to a pipeline. Residue gas is gas which has been processed at a natural gasoline plant where liquids are extracted and where other processing is performed. In Permian, ninety-six percent of the raw gas delivered to gasoline plants is oil well gas.

The supply of casinghead gas is less reliable than that of gas well gas, because it is produced only in the course of oil production, regardless of the demand for gas. Nationally casinghead gas which is at low pressure or whose quality is otherwise inferior commonly sells at a lower price than gas well gas or residue gas. Permian casinghead gas is not of pipeline quality; it is at low pressure and

[23] In Staff's historical cost presentation, E&D is determined on a current basis in accordance with its allocation method. In the Examiner's determination of the cost of old gas well gas, the E&D allowance is based on average historic E&D cost; consistently, in the Examiner's current cost study for new gas well gas, current E&D is used.

[24] These will be discussed in detail in Appendix D, p. 392.

otherwise generally inferior in quality except with respect to Btu content. Permian casinghead gas has always sold at a lower price than Permian gas well or residue gas. Permian casinghead is of sufficiently poorer quality than residue gas to warrant its being classed in a separate category for pricing purposes to reflect its lower value.

Like casinghead gas, the supply of most Permian residue gas is less dependable and less responsive to the demand for gas than gas well gas because the supply of oil well gas from which it is derived also depends on the demand for oil and the prorationing rules, not on the demand for the gas. Oil allowables expire at the end of each month, and the purchasing pipeline frequently suffers shortages of residue gas at that time. Freeze-ups in oil production in winter sometimes interfere with residue gas supplies. The supply of gas well gas is more regular and can be increased to meet changes in residue gas supply and also to meet peak demands. On the other hand, residue gas is delivered in large quantities by the gasoline plant at a single point, whereas typically the pipeline has to obtain gas well gas at the wellhead and do its own gathering.

The historic price relationship between gas well gas and residue gas is indicative of the relative values of these two gases. Nationally, gas well gas and residue gas commonly sell at about the same price for supplies of equal quality under equal conditions. In most areas gas well gas is dominant and governs the market price. In Permian this relationship is somewhat clouded by two factors: gas well gas is not the dominant gas in Permian; and the competitive struggle between Transwestern and El Paso with respect to price and supply has distorted some price relationships.

Prior to 1945, El Paso used gas well gas almost exclusively, the residue gas from Permian being largely vented, used by the producers, or converted into carbon black. With the construction by El Paso of its pipeline from Permian to California during the post war period, the demand for Permian residue gas expanded. The historic average price relationship among Permian gas well, residue and casinghead gas is indicated by two studies of the weighted average initial base rates. (Initial base rates are a better indicator of bargained-for price relationships than average prices because they avoid the distorting effects of escalation resulting from the action of third parties and uneven escalation.) The first study, using the initial base rates[25] of all Permian contracts on file with the Federal Power Commission during 1960 shows the relationship among gas well, residue and casinghead gas as (using the average price of gas well gas as an index of 1) 1.0, 0.75, and 0.66, respectively.[26] The second study shows the weighted average initial base price by type of gas for all Permian contracts filed by El Paso during the period 1957–1960. This relationship, again using gas well gas as an index of 1, is 1.0, 0.88, and 0.72 for gas well, residue and casinghead gas.[27] These and other pertinent price data are shown on the table on page 359. El Paso is by far the largest pipeline purchaser in Permian and its purchase price pattern is significant.

In the El Paso renegotiation the price of pipeline quality residue gas was established at 17 cents with similar grade gas well gas at about 15.5 cents. These prices are in part the result of Transwestern's efforts, beginning in 1958, to "blast" its way into El Paso's supply area by acquiring large blocks of residue gas controlled by the gasoline plants, which it needed for its certification. The El Paso renegotiation was made under the thrust of an even greater threat-

---

[25] Contracts on file June 7, 1954, were priced at the rate in effect on that date.

[26] Distributors' memorandum, dated August 30, 1963.

[27] Distributors' memorandum, dated August 30, 1963. Whether the average quality of residue gas has been improving in relation to gas well gas is not shown.

Relative prices of gas well, residue and casinghead gas sold under Permian basin FPC rate schedules

	Gas well gas	Residue gas	Casinghead gas
A. Initial base rates (or June 7, 1954 rates) under rate schedules on file in 1960:[1]			
Average price	*Cents* 11.70	*Cents* 8.80	*Cents* 7.60
Index (gas well gas=1)	1.0	0.75	0.66
B. Initial base price under El Paso purchase contracts entered into 1957–60:[2]			
Average price	12.5	11.0	9.03
Index	1.0	0.88	0.72
C. 1960 Actual revenues under rate schedules on file in 1960:[3]			
Average price	13.12	12.85	9.98
Index	1.0	0.98	0.76
D. Revenues under rate schedules on file in 1960 at rates in effect on 12/31/60:[4]			
Average price	13.91	14.44	11.57
Index	1.0	1.04	0.83

[4] Exhibit 289, Table 1.

ened increase in price due to favored nation clause operation. The price for the dominant residue gas was thus subjected to intense upward pressure.[28] The price relationship between residue and gas well gas in Permian represents something of an anomaly. The increase in the proportion of gas well gas in Permian due to recent discoveries at depths below 7,000 feet as well as the lessening of this competitive pressure would tend to equalize the prices for similar quality Permian gas well and residue gas.

Many Permian contracts permit the seller to deliver either residue gas or gas well gas to the pipeline, provided that processing by the seller does not reduce the Btu content below a specified minimum. Thus the largest sales contract in the Staff's compilation in terms of 1960 deliveries is a Phillips rate schedule for a sale to Northern from four gasoline plants and two extensive gas well gas producing areas. Under this contract Phillips has the option to deliver raw gas at the well-head or to process the gas and deliver the residue therefrom. When the buyer permits the seller to substitute one gas for the other, it is an indication that the two types of gas have equal value.

Turning now to the cost aspect, casinghead and residue gas are produced jointly with oil and liquids, respectively. As has been discussed previously, joint costs can be divided on various bases for specific purposes. The various allocated historic costs for residue gas and oil well gas submitted by the parties are discussed in Appendix D. It is there concluded with regard to the aggregate of the allocations used by each of the respective parties in their various estimates of the "cost" of residue[29] and of casinghead gas, that none of these results is

[28] As an instance of this, Transwestern in 1958 contracted to pay 21.8 cents for a certain residue gas supply a portion of which was then being sold to El Paso for 10 cents. The Commission authorized abandonment of the sale to El Paso and certificated the sale to Transwestern at a conditioned initial price of 18 cents. This residue gas supply contributed nearly 24 percent of Transwestern's total dedicated reserves at the time the pipeline was first certificated. *Transwestern Pipeline Company, et al.*, 22 FPC 391, 398–399 (1959).

[29] The problem here is not just determining the "cost" of residue gas on the basis of dividing the joint costs of the gasoline plants between the residue gas and the liquids. There is also the problem of piling these divisions high on the aggregate of the divisions used to divide the joint costs of the oil wells between the oil well gas and the oil. While Warren submitted a division of the gasoline plant joint costs, it relied on the contract price of oil well gas to determine the cost of the joint intake gas cost.

meaningfully representative of or related to cost, or is intellectually satisfying as a rational, equitable or fair division of the total joint costs.

Because of the fictional nature of the separate "costs" for residue gas; because of the pre-eminent position in the national market of gas well gas; because nationally, gas well gas and residue gas commonly sell at about the same price for comparable supplies; because the historic average initial base price in Permian for residue gas does not exceed that for gas well gas; because the higher price for Permian residue gas in relation to that for gas well gas of similar quality is anomalous, of relatively recent origin, and reflects temporary economic factors whose significance is waning; because the growing unity of the southwestern gas market and the increasing importance of gas well gas in Permian would tend to equalize the prices for Permian gas well gas and residue gas of similar quality and value in a free market; and because of the general superiority in value of gas well to residue gas (except with respect to gathering), it is concluded that Permian residue gas should be priced on the basis of an equal value relationship with gas well gas.[30]

Permian casinghead gas is of distinctly poorer quality than Permian gas well and residue gas. This physical inferiority has always been reflected in a substantially lower average price, and this relationship would undoubtedly continue in a free market. A relative value of 0.75 to Permian gas well gas reasonably reflects the lower average quality and market value of this gas, as measured by the historic Permian price relationship.

In determining the basic or average prices and price relationships for the various types of gas, emphasis has been placed on four factors: cost, relative value, supply, and quality. The situation in this industry does not lend itself to the general application of a single factor, such as cost, to all situations. Meaningful costs can be determined in this case only for gas well gas. The influence of price on supply is significant only for new gas well gas. Value in relation to gas well gas has been used to determine the price basis for residue and casinghead gas, because here cost and supply factors are not meaningful or significant. Quality has also been considered, particularly for casinghead gas.

IV. Permian Area Rates for Small Producers

There are some 350 respondents in this proceeding. There are some 1,400 producers in Permian including those whose sales are not subject to the Commission's jurisdiction. If percentage producers are included, the number of those having direct interests in Permian gas production totals some 2,600.

The basic difference between the small and the large producer is that the risks of the business are materially different for each. The small producer's exploratory activity is not extensive enough to afford him the likelihood of achieving average results, whereas the large producer over the years can approach this result. As TIPRO witness O'Hern points out "* * * a series of dry holes are costly to the major producer, but generally fatal to the smaller producer." (2/1004.)

The information in the record is much more complete for the large producers, those making jurisdictional sales of 10 million Mcf annually on a national basis,

[30] Faced with a similar problem, the impossibility of determining a meaningful cost of freight carried on passenger planes, the Civil Aeronautics Board fixed minimum rates for such freight on the basis of the cost of freight carried in freight planes. *Air Freight Rate Investigation*, 9 C.A.B. 340 (1948).

than for the smaller producers. The Staff exhibits based on the results of the Appendix B and C questionnaires sent to the Respondents include the results for all but one of the large producers. For the approximately 300 respondents in the under 10 million Mcf group, the Staff exhibits include the results for only 94 producers. Of these, 76 were based on Appendix C which is less detailed than the Appendix B required of the large producers.

While the cost and income data shown in the Appendices for the small producers is less representative than for the large producers, comparisons between the two groups are significant. On a per Mcf basis, the small producers had relatively larger dry hole expenses, a smaller proportion of geological and geophysical expenses, and a smaller proportion of lease acquisition expenditures. On a unit basis smaller producers had a relatively larger DD&A expense than the larger producers.

The comparative ratios regarding income and net investment for the two groups of producers are also different. Exhibit 255, schedule 4, shows that the ratios of income available for income taxes, cash dividends and working capital to total revenues were 16.2 and 7.3 for the large producers and the small producers, respectively, with the weighted average ratio of the two combined, 15.7. The ratios of net revenues to net investment were 15.0, 4.0, and 14.1 for the large producers, small producers and the weighted average. The ratios of income available for income taxes, cash dividends, and working capital to net investment were 7.8, 2.5, and 7.4 for the large producers, small producers and for the weighted average. The descriptions of the way they operate by the witnesses for the small producers also suggest that they are engaged in a business that differs in material respects from that of the large producers.

Staff argues that differences in cost vary with the lease and not with the size of the producer.[31] But the operations prior to drilling are different, the large producers spending a greater proportion of their finding expenditures on lease acquisitions and scientific activity, and the small producers preferring to test by the bit. Thus even if the lease costs of the two groups be similar, the operations of the large producer who participates in the drilling of large numbers of wells annually is different than that of the wildcatter.

The burden of complying with the rate filing and certificate regulations is onerous for the typical small producer. The administrative problem of administering rate schedules and certificate applications for hundreds of additional producers is not light.

The impact upon the consumer results only from the average price paid by the pipeline for all of its gas, and the amounts of gas sold by small producers do not substantially affect the results as a whole. A few large producers[32] dominate the market. Fewer than 50 of them, each with national annual jurisdictional sales of over 10 million Mcf, sell 87 percent of the jurisdictional gas sold in Permian. Nationally some 75 large producers make 82 percent of the national jurisdictional sales.

The class of small producers might be limited to those selling nationally 2 million Mcf or 5 million Mcf annually. While there are a considerable number of producers in the 5–10 million Mcf category, their interstate sales represent only 2 percent of Permian jurisdictional sales, and only 5 percent of national jurisdictional sales. The practical dividing line seems to be at the 10 million Mcf level.

Under Section 154.91(e) of the Regulations the Commission has already created a special class of producers: sellers under percentage type contracts have

[31] The testimony of TIPRO's witness Abel indicates that even in the matter of lease operations the small producer's methods differ.

[32] As used here, producers include sellers of residue gas from gasoline plants.

been relieved of the rate filing and certificate requirements under Sections 4 and 7 of the Act on their percentage sales.[32]

Section 16 of the Act provides:

> For the purposes of its rules and regulations, the Commission may classify persons and matters within its jurisdiction and prescribe different requirements for different classes of persons or matters.

Because of the circumstances described above, particularly the special nature of the risks affecting their operations, the limited scope of their individual operations and the limited impact on the interstate gas market of their combined operations, and because of the undue burden which complete compliance with the regulatory system entails, it is concluded that the public interest and the public convenience and necessity require the classification of producers between small and large producers. Those producer respondents whose national jurisdictional sales for 1960 and for each year thereafter were less than 10 million Mcf shall be designated for rate and certificate purposes as "Small Producers", except that this class shall not include sellers of residue gas from gasoline plants. Gasoline plant sellers are not included in the class of Small Producers because they are not subject to the special risks of small producers, because it is not an undue burden on such operators to comply with the Commission's filing requirements, and because special treatment for a gasoline plant would tend to disrupt the supply arrangements of other gasoline plants by affording opportunities to percentage sellers with their short term contracts to switch to small producer plants. For rate and certificate purposes a second class of respondents will be designated "Large Producers", which will include all respondents herein who do not come within the classification of "Small Producers."

An appropriate regulation defining more specifically the classes of Small Producers and Large Producers should be issued. For purposes of this classification, a producer will include partners, substantial stockholders or holders of beneficial interests. In determining classification, the sales of a producer will be aggregated with those of affiliated or related producers including, without limiting the generality thereof, producers that to a material degree are under common ownership or control or operated in a common interest.

Any producer desiring to be included in the class of Small Producers may file an application with the Commission for such classification. Classification as a Small Producer will be granted to those meeting the qualifications for this class. It is concluded that the public convenience and necessity require that members of this class be granted a general certificate authorizing jurisdictional sales of natural gas. The certificate will cover all jurisdictional sales made by a Small Producer while it is validly outstanding. If in any year a Small Producer makes jurisdictional sales of 10 million Mcf or more, he shall cease to be a member of the class of Small Producers at the close of that calendar year, and his general certificate shall not apply to new contracts entered into thereafter. In appropriate circumstances the Commission may reinstate such a producer to the class of Small Producer. These general certificates issued on the basis of this hearing would eliminate the delays involved in certificate hearings, which TIPRO has emphasized constitute an undue burden on Small Producers.

It is further concluded that, taking into consideration the special circumstances surrounding the operations of the Small Producers, the facts of record show that the Permian area rates of this class are and have been just, reasonable and not unduly discriminatory or unduly preferential.

With respect to the certificate applications of the Small Producers consolidated herein, their applications should be granted subject to the same conditions re-

[32] Percentage sellers as such are primarily producers of oil.

garding the proposed initial prices as for the Large Producers, prescribed in Part V at page 371 below. However, upon request filed within thirty days of the Commission's decision herein, any person whose certificate application has been consolidated herein may petition to make the sales therein applied for pursuant to the general certificate to be authorized for Small Producers, instead of under the certificate specifically applied for. This petition will be granted if the person is determined to be eligible for the class of Small Producers.

In view of the circumstances peculiar to their operations, the class of respondents designated Small Producers are relieved of the requirements of filing rate schedules and specific certificate applications under Sections 4 and 7 of the Act, except that they will be required to obtain a general certificate, which will be issued when their eligibility as a Small Producer is determined. Small Producers will be required, pursuant to appropriate regulations, to file simple annual statements with respect to their jurisdictional sales. Such a regulation would also require the pipeline customers of Small Producers to include in their annual reports information with respect to their purchases from this class.

As a practical matter, it is not likely that pipelines entering into contracts after the date of decision herein will, except in unusual cases where gas is otherwise unavilable, pay more to Small Producers than the ceiling prices established herein for Large Producers. In an unregulated market under normal conditions, the Small Producer would tend to receive the same price as the Large Producer. The pipelines are only interveners and cannot therefore be directly governed by rules laid down in this proceeding. However it is appropriate to let it be known that as a matter of policy a pipeline paying more than ceiling prices for new gas after the decision herein will be expected to justify its action in any future rate case where its costs are in issue.

With respect to old gas sold by percentage sellers, there is a possibility that pipelines whose rates are regulated on an individual company cost of service basis could invade the territory of established gasoline plants and offer higher prices to Small Producers to induce them to switch. However, Section 154.91(e) of the Regulations specifically makes percentage sellers subject to Section 7(b) of the Act requiring permission to abandon a sale.

Permitting the rates of Small Producers to be determined on a different basis than that used for large producers will not result in triggering favored nation clauses in the contracts of the latter. In the first place, only a tiny portion of Permian contracts now contain favored nation clauses. Second, the rates for all old gas sold by Large Producers, which will be established below, are fixed and are not subject to change without the permission of the Commission. Third, favored nation clauses in contracts presently on file are found below to be contrary to the public interest and are made prospectively inoperative and of no legal effect. Fourth, under Section 154.93 of the Regulations, favored nation clauses have been made inoperative and of no effect at law in any contract executed on or after April 2, 1961. *Federal Power Commission* v. *Texaco Inc.*, 377 U.S. 33 (1964).

It should be noted that, in determining the cost of new gas well gas, the essential cost items were determined on an industry wide basis. Thus the costs of the class of Small Producers were considered in the basic computations used herein.

Differentiating the class of Small Producers from large Producers for area rate purposes is in consonance with the economics and institutions of the industry.

V. Permian Rate Design for Sales by Large Producers

As used herein the term "rate design" covers both the method for translating national revenue standards to a Permian area basis, and the determination of the

appropriate distribution of the resulting revenues in the form of rates for gas sold by Large Producers.

A. TRANSLATING NATIONAL REVENUE STANDARDS INTO PERMIAN PRICING STANDARDS—GEOGRAPHICAL DISCOUNT

We turn to the first problem, translating the national average revenue standards into Permian standards. There are two area value factors for which adjustments to the national standards should be made: (1) Location value, the value to the consumer of gas supply that is adjacent to the consumer market, resulting in savings in transportation costs; and (2) Relative demand on the producing area from the marketing areas it supplies. Area value differentials reflect the relative value of gas in different areas arising from geographical and economic factors. The economic function of area differentials is to promote exploration for gas in and the flow of capital to areas where gas is of greater value to the economy than in other areas.

As to location value, Permian gas is 900 to 1,300 miles distant from its principal points of interstate use in California, which is an average haul considerably longer than the average haul from the Gulf Coast to its markets. Of course, a considerable amount of Permian gas is consumed locally, in field use, by local utilities and in the manufacture of carbon black. While some Gulf Coast gas is transported all the way from Mexico to Boston, much more of the gas produced in that area is locally used; much of it goes to the middle west and the south at a relatively short haul. Permian is in a section of the country which is not now and does not appear to be in the process of becoming a major industrial center, whereas the Gulf Coast is experiencing rapid industrial growth. For these reasons Permian gas is less valuable than gas discovered on the Gulf Coast and other areas nearer to their markets, and therefore less valuable than the average for the nation.

The California market is important and growing. But it is difficult to evaluate the demand-supply relationship for this market: first because this involves the over-all determination of factors such as potential Canadian supplies, and supplies from the Rocky Mountains and other western areas, and second because Permian is only one of several sources of gas for the West Coast and Arizona-New Mexico. The increasing interconnection of various consuming areas to different producing areas adds to the difficulty of evaluation.

The national price structure reflects to a considerable degree differences in value factors. To this extent, a measure of the relative value of average Permian to average national gas is indicated by the difference for a representative period between average new contract prices in Permian and in the seven southwest states[34] which account for 95 percent of all production sold to pipelines in the nation in 1960. It should be noted that, although Permian production includes a greater proportion of casinghead gas than the national average, most Permian casinghead is processed and sold to pipelines as residue gas. Of Permian sales to pipelines in 1960, only some nine precent was the lower priced casinghead gas.

For many years El Paso was the only substantial interstate buyer in Permian. Since there was competition among pipelines in most other areas during this period when demand was rising rapidly, there was a tendency for Permian price increases to lag behind the national average. The Permian-national price relationship during this period would therefore not directly reflect an appropriate value relationship. Specifically, prior to 1954, El Paso was the only interstate pipeline buyer in Permian. Northern began purchasing there in 1954, and West Texas Gathering Company and Permian Basin Pipeline Company began buying in Permian in 1957. During 1958 and 1959, Transwestern was actively contracting for new gas in Permian in competition with El Paso. These were years of

[34] Arkansas, Kansas, Louisiana, Mississippi, New Mexico, Oklahoma, and Texas.

competitive buying in Permian, culminating in the El Paso renegotiation beginning in 1959 and extending into 1960. The same situation prevailed in other areas. While buying in Permian was competitive during this period, it is probable that in other areas where competitive buying had been common for a longer period, price levels had risen to a comparatively greater degree than in Permian. The spread between weighted average Permian initial base prices under long-term contracts and the national average for these three years was 2.2 cents. The Distributors urge that this figure be used as the location factor or geographical discount. The price spread between Permian and the national average (as measured by the average for the seven southwest states) declined after 1960. In 1961 Permian prices continued their rise while the national averages fell back almost a cent. Permian remained steady in 1962 while the national average again rose. The average spread for the three years 1960, 1961 and 1962 was 1.27 cents. This result may have been influenced by the adoption of the Commission's area guideline prices on September 28, 1960, since producers could thereafter generally avoid contested "in-line" hearings by setting initial prices within the guidelines; however, the record does not show the effect of the guidelines on such prices.

Other factors in the decline in the price spread between Permian and the national average are the growing unity of the market in the seven southwestern states and the increasing inter-market availability of gas. The last item is of growing significance, and it is in considerable part for this reason that it is concluded that the average price differential for the three most recent years, 1.27 cents, should be employed here as the standard. This figure will be rounded to 1.25 cents.

B. PRICE STRUCTURE FOR OLD GAS

It has already been determined that for purposes of this proceeding the national revenue standard for old gas well and old residue gas should be 12.82 cents. This is the point of departure for determining Permian prices for these types of gas. The next step is to apply the geographical discount for Permian of 1.25 cents per Mcf, which produces 11.57 cents per Mcf. This figure will be rounded to 12 cents per Mcf,[25] which will serve as the Permian revenue standard for old gas well and residue gas. It represents the area average unit revenue that should be realized from the sale of these gases. The total revenue to be realized is, of course, the volume of gas times the revenue standard. The rate design problem is first, to insure that the rate structure is such that producers can reasonably obtain these revenues, and second, that the price structure properly reflects price differentials for the different qualities and values of gas. Rate design is concerned with insuring that producers as a group have a practical opportunity to realize the revenue standard under their contracts and with the distribution of that total amount among the various contracts.

In most industries if a ceiling price is set, all parties are in a position to charge that price, thereby obtaining the revenues determined appropriate under the revenue standard. But in the gas production industry this does not follow. If the ceiling is set at 12 cents many producers could not under their contracts charge 12 cents, and so area producers would receive less than the revenue standard. Hence the area revenue standard cannot be used as the ceiling price unless the standard is set at an unreasonably high level.

The value of gas to the buyer depends on certain quality and value features. Thus high pressure gas located near the main pipeline and near the point of consumption is more valuable than gas having the opposite features, other things

[25] The upward adjustment provides a cushion for changed circumstances, as discussed below.

being equal. The major quality features of gas include: pressure, Btu sulphur content, water content. Major non-quality value features include: location of the delivery point in relation to where the gas is to be transported and in relation to the pipeline's facilities, swings between minimum, average, and maximum delivery, the vintage of the contract which involves the cost levels and the demand then prevailing, cost of gathering in relation to size of the delivery, amount of the gas available, minimum take or pay provisions, the buyer's needs for particular gas at a particular time and place. To the seller, the rate of take is also an important value factor. Some of these value and quality factors involve a specific cost to the producer; others are simply a characteristic of some gas. The price expresses the "bundle" of considerations to the buyer and to the seller.

Maintenance of quality and value to the buyer in the rate design is imperative. If ceilings are set and the average quality or the value of the gas sold at the ceiling deteriorates, values are being diluted. Lowering the quality of the gas is the same as raising its price. If the pipeline purchases gas of lesser quality than previously, then bears the cost of additional processing to raise the gas to its former standard, and includes the added costs in its cost of service, the result is the same as if the prices charged for the gas by the producer were raised. A pricing system that fails to insure quality and value is a sieve.

A price structure affording the opportunity to balance the revenues received with the revenue standard and also insuring the maintenance of quality and value can be effectuated under the "spectrum" rate system, which uses two industry institutions: the long-term contract, and the multiple price structure. The first step in this system is to establish the revenue standard. The second is to determine a "gold standard" for pipeline quality gas and for other value considerations to the buyer. The gold standard is the premium above the average price for superior quality and value. It determines the ceiling price for the type of gas. Pipeline quality gas is gas that the pipeline can take into its system without material additional treating or compression.

There are two estimates in the record for the level of the gold standard. Witness Frazier's estimate was that it should be one cent. Distributor witness Jensen relying partly on Frazier and partly on his own analysis of the provisions of the Permian rate schedules concluded that there should be a 1.5 cent gold standard adjustment. If a gold standard of 1.5 cents is used for residue gas, with an average realization of 12 cents, and if the contract rates are compressed as described below, there will be a range of 3.4 cents between the rates at which 30 percent of the one-stage residue gas will be priced and the rates for 95 percent of the three-stage gas.[36] This is in consonance with the historical differentials for residue gas.[37] Accordingly, Jensen's differential of 1.5 cents is adopted as the gold standard for residue gas.

There is little gas well gas with a pressure as low as 50 pounds, which is typical of low quality residue gas. Hence the range in quality of gas well gas is less than that for residue gas, and a gold standard of one cent would be suitable for old gas well gas. However it is convenient, simple and reasonable to have the same ceiling for old residue and gas well gas, and since the size of the gold standard does not affect the total revenues received but only the distribution of the revenues among the various contracts, it is concluded that a gold standard of

[36] Permian residue gas undergoes three or four stages of compression to render it of pipeline quality and to facilitate the extraction of liquids. The gasoline plants are referred to as "one-stage", "two-stage" or "three-stage plants" to describe generally the pressure to which the gas is compressed.

[37] Typical initial prices paid by El Paso for residue gas have been:

	1953	1958	1960
1 Stage Plants	7.0	8.0	13.5
2 Stage	7.5	8.5	14.0
3 Stage	10.0	11.0	17.0
Differential	3.0	3.0	3.5

1.5 cents should also be applied to old gas well gas. Thus the gold standard for residue and gas well gas is 1.5 cents above the 12-cent average, giving a ceiling for these types of gas of 13.5 cents.

The third step is to compress all rates for Permian residue and gas well gas on file with the FPC during 1960 in this fashion: All such rates shall be reduced by a uniform percentage so that the average revenues are 12 cents per Mcf for each type of gas, except that all rates shall be reduced at least to 13.5 cents and no rate shall be reduced below 10 cents.

The results are approximately as follows:[38]

Residue gas

Contract rate	*Allowed rate*
10¢ or less	Contract
10.0–11.86	10.00
12.0	10.12
12.0553	10.17
12.25	10.33
13.25	11.17
13.50	11.39
14.0	11.81
14.50	12.23
16.0 or more	13.50

Gas well gas

Contract rate	*Allowed rate*
Less than 10¢	Contract
10.0–11.8255	10.00
12.00	10.15
12.50	10.57
13.50	11.42
14.50	12.26
15.00	12.68
15.50	13.11
15.7093	13.28
15.7862	13.35
15.9589 or more	13.50

The ceiling prices for the specific contracts for old gas well and residue gas are determined on the basis of such tables. (Hereafter reference to the specific ceiling prices for old gas well and residue gas contracts will refer to the specific prices determined from such tables.) This method preserves the relative differentials in the existing contracts and uses them to reflect the relative value and quality differentials in the various contracts.

[38] The rates as of June 1, 1963, under the rate schedules on file during 1960, furnish the most recent pattern, and it is preferable to use these more recent rates to those in effect on December 31, 1960. Jensen's Exhibit 337 provides the complete data and tables for accomplishing the results using either data, with several variations. The mechanics of the compression method are shown in Appendices K and L of Warren's reply brief.

The tables above show the results for the Large Producers; they exclude the residue gas sales of persons who sold less than 10 million Mcf, but who nevertheless are included in the class of Large Producers because they are sellers of residue gas from gasoline plants. The inclusion of these sales would not change the results to any significant degree. The table does not take into consideration rates that may be raised pursuant to section C below regarding minimum rates. The changes required to take this into account would be slight. The arithmetical calculations can readily be redone with Jensen's tables and the method of calculation described in Warren's reply brief.

The effect of compression in the tables above is to reduce contract prices between 11.8 cents and 16 cents by 15.5 percent, approximately, for each type of gas. Rates above 16 cents would be reduced by a greater percentage and rates below 11.8 cents, approximately, by a lesser percentage.

It is extremely difficult in any case, and probably impossible on this record, to establish a complete set of differentials for the various value and quality characteristics of gas. As has been discribed above, the contracts embody a multiplicity of provisions reflecting many items of negotiation between the buyer and the seller. The cost elements cannot really be isolated because this involves all the frailties of the allocations used in determining the "cost" of producing and processing gas. The CPUC advocates using the differentials proposed in the Commission's Notice of Proposed Rulemaking in Docket No. R–200,[39] but there is no basis in this record for adopting them. Staff virtually abandons efforts at quality differentials, and its price structure permits practically all gas of the same type to sell at the same ceiling regardless of its quality and value. Respondents would set the ceiling for all Permian gas at 20 cents, leaving differentials for lower value and quality to be determined by the negotiations of the parties. Since the highest price currently being paid for Permian gas are a few Transwestern contracts at 18 cents, they are probably correct that a 20-cent ceiling would produce lower prices for gas of less than top quality. But the resulting price level would be unreasonably high.

The existing contract structure undoubtedly contains instances where price was influenced by the superior bargaining power of one of the parties. However, at this stage of our knowledge and on this record, the relative prices in the existing contracts based on the negotiations of the parties provide a sounder means of determining the relative price structure for old gas contracts than the establishment of specific differentials.

Instead of compressing existing rates to the extent required to balance over-all average revenues with the revenue standard, one can start with the last unsuspended rate for all contracts and permit equal increases for all such rates up to the level at which a balance is achieved between the revenues allowed and the revenues received. This method is advocated by witness Frazier who appeared as the Examiner's witness and Distributor witness Jensen.[40] The difficulty with applying this method is that the Commission's policies in the past did not result in uniform treatment of the last firm rates of all companies. For example, when the suspension level was raised from 9 to 11 cents, companies generally filed motions to terminate pending Section 4 proceedings where their suspended rates were below the new suspension level. The motions to terminate were generally granted, except with respect to companies that had pending Section 5(a) cases, such as Phillips. For this reason, many of the last firm rates of Phillips and other companies similarly situated are substantially below the average. Using the last firm rate as a starting point for equal increases would discriminate against these companies. The compression method treats all currently effective rates alike, whereas under the last suspended rate method the final rate structure is made to depend on the suspension policies of the Commission during the years, 1956–1960.

The compression method results in lower refunds than the last unsuspended rate method because the percentage reduction applies to all rates, whereas under the latter method, only the suspended rates are affected.[41] With respect to prospective rates, under Section 5 of the Act an unsuspended rate has no greater status than a suspended rate. The determining factor is that the compression method is preferable on its own merits; the refund element is a resultant that follows after the rate level and structure have been determined.

---

[39] A rule making proceeding instituted on May 22, 1961, relating to quality price differentials and in which comments of interested parties have been filed.

[40] If the general level of rates is to be reduced, Respondents prefer the compression method.

[41] The same effect could be achieved for the compression method by compressing only the suspended rates below the ceiling; but this also breaks up the existing rate pattern.

Turning now to casinghead gas, the same principles apply.[42] The revenue standard for Permian casinghead gas has been determined to be 75 percent of the Permian residue gas standard which results in a price of 9 cents per Mcf. Since no Permian casinghead gas is of pipeline quality and practically all is low pressure gas, differences in quality and value are less than for residue gas. A gold standard of 1.0 cent is therefore appropriate. Specific prices applicable to old casinghead gas should be determined by compressing the old contracts in the same way as for residue gas with no prices reduced below 7 cents per Mcf.

There are some El Paso casinghead contracts for the Spraberry area where payment for the casinghead gas is on the basis of the residue gas derived from the casinghead gas plus a percentage of the liquids. If the price for gas sold to a pipeline is partly in terms of a percentage of the liquids derived from the gas, then the price for the sale cannot be determined from the contract alone; it will fluctuate with the price of the liquids. While it is desirable to use and retain the industry's institutions wherever possible, a sales price expressed in terms of a percentage of liquids is not workable. For these reasons it is concluded that the consideration for sales of casinghead gas to pipelines under FPC rate schedules shall be in cents per Mcf for the raw gas and that no other consideration be given.

In sales of casinghead gas, the consideration may also include the right of the producer to have part of the processed gas returned to the lease. Where this occurs a deduction for the value of the gas returned to the lease shall be made at an amount not less than the rate paid by the pipeline for the raw gas. This rule does not apply to percentage contracts covered by section 154.91(e) of the Regulations.

C. MINIMUM RATES

There are some contracts with present rates considerably below the revenue standards adopted herein. The level of these rates may be due to the fact that these contracts were negotiated many years ago when costs and demand were lower than now; or it may be that location or other value factors are such that if the contract price were raised it would not be economic for the pipeline to buy the gas at all. While the number of these low priced contracts and the volume flowing thereunder is small,[43] the rates charged therefor may represent an inequity which should be remedied.

Considering the value factor, contract rates for residue and gas well gas below 9 cents per Mcf are prima facie unreasonably low; the same is true for casinghead rates below 7 cents per Mcf. Accordingly, it is concluded that with respect to contract rates below these amounts, the public interest and the public convenience and necessity require that the seller with the buyer's written consent be authorized to collect rates up to these levels and to file new rate schedules in accordance therewith.

D. PRICES FOR NEW GAS

For pricing purposes new gas refers to gas sold under contracts filed with the Commission on or after December 23, 1960, the date of the institution of this proceeding.

It has previously been found appropriate that the basic pricing standard for old residue and old casinghead gas be related to the cost of old gas well gas. The cost of service method uses average historic costs as the cost basis for all gas. Thus Staff uses its historically determined average costs as the basis for pricing all gas, old or new. This same theory underlies the studies on processing costs by the Distributors, the CPUC, and Respondent witness Carney. Though

[42] Casinghead gas ceiling prices apply to sales of raw oil well gas directly to a pipeline.
[43] See exhibit 337.

they use different methods to determine historic costs, they all use these historic costs as the basis for costing old and new gas. Respondent witness Keene's costs are also on a historical cost basis, and if applied would relate to all gas, old or new.[44] The cost determined here for old gas well gas is analogous to the historical cost of this gas. It is therefore arguable that it should be used as the standard to which all residue and casinghead gas, whether old or new, should be related by value.

However in this industry it is appropriate that a higher ceiling be allowed for new residue than for old residue gas to take account of changing circumstances. A premium basis for new gas well gas has been adopted because its price serves a supply eliciting function. The price for Permian residue gas serves no comparable function. Moreover a differential between the price of old and new residue gas must take into consideration an institutional factor. Residue gas is typically sold to pipelines under twenty-year contracts, but the plants typically buy their raw gas under three and five-year contracts. If the ceiling for new residue gas were substantially higher than the ceiling for old, there would be a tendency for producers selling under percentage contracts at the termination of their contracts to switch to plants (old or new) which had a contract for new residue gas, thus receiving a percentage of a higher price. There are barriers to such shifts: for example, the second plant would have to lay pipes to connect the wells to its plant.[45] But the creation of a large gap between the price for old and new residue gas would tend to lead to duplication of facilities and economic dislocation of existing institutional arrangements. Under the guidelines, increased rates above 11 cents have generally been suspended, whereas new sales at initial rates as high as 16 cents have been accepted. The 5-cent differential thus created between old and new residue gas has created problems of the kind just described. Accordingly, it is concluded that a ceiling price for new residue gas 1.5 cents above the ceiling for old gas is appropriate. For similar reasons, a ceiling for new casinghead gas one cent above the old is adopted.

Since the gold standard ceilings for old residue and casinghead gas are 13.5 and 10 cents, the ceiling for new residue and casinghead gas will be 15 cents and 11 cents, respectively. Prices for residue and casinghead gas sold under contracts filed as rate schedules on and after December 23, 1960, will be governed by these ceilings.

This record does not permit the determination of a complete set of quality and value differentials. However the most recent pricing patterns show that under contracts for the sale of old residue gas, 99 percent of the one-stage residue gas is selling at a differential of at least 2.5 cents below 95 percent of the three-stage gas; and that some 99 percent of the two-stage gas sells for at least 2 cents below 95 percent of the three-stage gas. Under the rates allowed herein after compression, the corresponding differentials are 2.11 cents and 1.69 cents. On this basis, it is concluded that for new residue gas, minimum differentials of 2 cents and 1.5 cents below the gold standard ceiling are appropriate for one-stage and two-stage gas, respectively. Accordingly, subceilings are established for one-stage new residue gas at 13 cents, and for two-stage new residue gas at 13.5 cents. The ceiling of 15 cents will govern three-stage residue gas. It is recognized that the resulting differentials are lower than those which have prevailed

[44] In presenting cost evidence, Respondents have not waived their over-all position that value not cost should be the basis for determining prices of gas. Respondents contend that the cost of gas cannot be reliably determined, though they concede that the cost of gas well gas may be estimated with a greater degree of reliability than the cost of gas produced with oil.

[45] Also, percentage sellers are subject to section 7(b) of the Act even though section 154.91(e) of the Regulations prohibits their filing rates or certificate applications.

in the past. This is because the smallest differentials under various pricing patterns have been adopted and because they have been determined by deduction from the 15-cent ceiling for three-stage gas. Furthermore, the subceilings are maximum prices and temporary until the Commission can establish more complete quality differentials. It is assumed that in further proceedings hereunder the Commission will go forward with this task. Meanwhile, prices for new residue and casinghead gas will be determined by the negotiations of the parties subject to the aforesaid ceilings and subceilings.

As previously determined the national current average cost for new gas well gas is 16.88 cents. Applying the Permian geographical discount of 1.25 cents produces 15.63 cents. A gold standard of one cent is appropriate for new gas well gas, since the quality differences for the bulk of this gas are less than for residue gas. The result, 16.63 cents, rounded upward to 16.75 cents, is found to be the ceiling price for new gas well gas.

Some gas well gas in Permian is sold to gasoline plants which extract liquids from it. The theory of the two-price system requires that in this case the residue gas sold by the gasoline plant which is attributable to new gas well gas be governed by the ceiling for new gas well gas.

E. SECTION 7 CERTIFICATE APPLICATIONS

The section 7 certificate applications consolidated herein of the Large Producers should be granted at initial prices not exceeding the following schedules:

	Gas well	Residue	Casinghead
Old gas	13.5	13.5	10.0
New gas	16.75	15.0	11.0

F. CHANGES IN SPECIFIC CEILING PRICES FOR OLD GAS WELL GAS

As has been discussed previously, many gas contracts cover additional reserves that may be discovered within the bounds of the contract. These contracts generally provide that the seller may abandon deliveries under the contract if and when further operations thereunder are uneconomic. He, of course, cannot sell to anyone else. In such a situation, the producer may be able to find additional gas at a price slightly above the old contract price, and the pipeline may in the light of the circumstances find it economic to amend the old contract by increasing the price. The same situation may occur with respect to the specific ceiling prices set herein for old gas well gas contracts. A producer of old gas well gas who under his contract is in a position to abandon production because he can no longer deliver gas at his specific ceiling price, and who enters into a new contract with the pipeline for further drilling to secure additional reserves of gas at a price above the specific ceiling rate established for his contract, and which rate is at or below the ceiling for new gas well gas, may petition the Commission for an exception. Such a petition should have attached to it the proposed contract and a cost-benefit analysis justifying the higher ceiling price under the new contract on an incremental cost basis. In this situation the pipeline will have already agreed to the change in the existing ceiling rate, and a similar analysis justifying this change will undoubtedly have been prepared in presenting the justification to the pipeline.

G. THE STAFF RATE DESIGN

The major features of the Staff rate design are as follows: Separate unit "costs" of 11.95 and 14.46 cents are determined for all Permian gas well and residue gas. The weighted average "cost" of the two gases is then determined

to be 13.38 cents. Some contracts establish a specific price level from which deductive charges for inferior quality are made. Where the contract price exceeds the ceiling price, Staff requires that the contract first be reduced to the ceiling and then the deductive charge applied. To offset the over-all area effect of these deductive charges the ceiling is raised to 13.7 cents.[46] A ceiling of 9 cents is set for casinghead gas. A proportionate reduction is also made for gas of less than 950 Btu per cubic foot. These are the Staff's revenue standards for old and new gas.

The Staff rate design is subject to two major criticisms. First, the existing contract institution would prevent the producers in the Permian area from realizing the allowed revenues under the Staff's proposed revenue standards. The deficiency based on 1960 volumes and prices is substantial, over $5 million. It is improper to disregard an established industry institution, the long-term contract and its effects on producers. On the basis of the Staff's revenue standard, its proposed rates would be unjust, unreasonable, and therefore unlawful.

Staff's argument is that it is improper for some contracts to receive "more than the reasonable rate in order to make up for the deficiencies in others under low price contracts." (240/28,388.) In the first place, Staff assumes that a rate higher than the average is unreasonably high. Second, Staff confuses the issue of the over-all level of area rates with the issue whether an individual rate is unduly discriminatory or preferential. The reasonableness of area rates concerns the rate level—the average, the maximum and the minimum. Within this framework, the relationship of one rate to another (undue discrimination or preference) is irrelevant to the question of the justness and reasonableness of the over-all rate structure. But Staff does not criticize a single rate on the grounds of undue discrimination or preference. Staff's argument contravenes the very basis of area rates.

Second, Staff's rate design does not sufficiently relate price to quality or value. Staff's quality differentials are limited to: a lower ceiling price for casinghead gas than for gas well and residue gas; a proportionate deduction for Btu below 950 per cubic foot; and the requirement that contractual deductive charges be deducted from the ceiling price where the contract price exceeds the ceiling. Except for these instances, the Staff rate design permits gas of any quality to be sold at the ceiling for that type of gas, absent a contractual bar. As Staff says, "The area rates should be uniformly applicable to gas of any quality acceptable to the purchaser." (Brief, p. 37.) Thus Staff's 13.7 cent ceiling applies to one-stage, sour, undehydrated residue gas; this is the lowest quality residue gas, and for which the current El Paso contract price is 13.5 cents. Staff's rate design applies the same ceiling to three-stage, sweet, dehydrated residue gas for which the current El Paso contract price is 17 cents. The failure to establish adequate quality differentials is unfair to the sellers of high quality gas, and will ultimately prove harmful to the consumer because this pricing structure will tend to deteriorate the quality of residue gas sold to the pipeline. The pipeline will then include the cost of bringing the gas up to pipeline quality in its cost of service.

Two lesser points: Averaging the "cost" of gas well and residue gas (but not casinghead gas) is inconsistent with the theory of separately determining the cost for each of the three types of gas. With regard to deductive charges, Staff requires that contract prices be reduced to the ceiling and that the deductive charge then be applied, in effect setting an individual subceiling for such contracts. It is largely a question of form whether a contract price was set first and a deductive charge then stated, or whether a contract price was negotiated

[46] This is an oddity in Staff's presentation since no offset is allowed for producers who cannot achieve the ceiling for other contractual reasons.

taking these charges into consideration. To assure uniform results, the contract price should be netted prior to the application of any ceiling.[47] Since the deductive charges will no longer prevent a producer from achieving Staff's ceiling if they are netted, the allowance for this should be eliminated and the Staff ceiling restored to its original level of 13.4 cents per Mcf for residue and gas well gas.

Staff also presents an "alternative" rate design, although they "adhere to the Staff rate proposals heretofore presented * * *" (Brief, p. 57.) The alternative proposal consists of an elaborate system of premiums and deductions for various qualities of gas. There is insufficient evidence in this proceeding, as Staff seems to concede, to support its proposal. It merits exploration in a proceeding devoted to quality differentials. Moreover the proposal was not presented during the hearing by testimony or memorandum, or in the Staff's outline of its argument on brief, all as required by the Examiner's overriding order of July 23, 1963. It is not properly presented at this stage.

H. ESCALATION

In section B above, specific prices for all old gas contracts have been established. The finding costs for this old gas have already been expended. The significant changes that can affect the cost of this gas are possible changes in the lesser amounts for current production costs. To take account of such potential factors, an allowance of some 0.4 cents has been made in the price of residue and gas well gas, and some 0.3 cents in the price for casinghead gas. The record does not show general cost or price changes since 1960, but the Bureau of Labor Statistics All Commodities Wholesale Price Index has been fairly steady since 1958. *E.g.* (1957–59=100): 1958, 100.4; 1959, 100.6; 1960, 100.7; 1961, 100.3; 1962, 100.6; 1963, 100.3. For these reasons periodic increases in old contracts including those permitted under section 154.93 of the Regulations will not be permitted to affect the ceiling prices established for the specific contracts for old gas.

Ceiling prices for new residue gas and new casinghead gas have been established at 1.5 cents and 1 cent, respectively, above the prices for old gas to take account of changes in circumstances. The price of new gas well gas has been determined on a 1960 current cost basis.

In these circumstances there is no need for general escalation clauses. Most favored nation clauses and spiral escalation clauses cause price increases in a contract price to occur without reference to the circumstances or economics of the particular operation, but solely because of what happens under another contract. These clauses contravene the public interest and the basis on which prices have been determined in this decision. They are therefore declared to be inoperative and of no legal effect. No change in a rate resulting from such indeterminate pricing provisions will be permitted to take effect under this decision and order.

Clauses in contracts for new gas providing for rate increases that are consistent with section 154.93 of the Regulations may take effect, provided that such increases may take place only up to the appropriate ceiling prices. (Under this section of the Regulations clauses of the type permitting periodic increases every five years are authorized.)

I. PROVISION FOR RELIEF

In instituting this proceeding the Commission found that the practicalities of regulation require, and the Act permits, that a group rate system on an area basis

[47] In Jensen's exhibit 337 prices are on a net basis after subtracting the deductive charges.

be adopted instead of establishing rates on an individual company basis. Group rates based upon typical group evidence may lead to serious injustice to an individual producer. Procedures should therefore be established whereby a producer able to show that continued operation under the rates established herein will result in confiscation of his property on a company-wide basis (including affiliates) shall be entitled to relief, either through an order pursuant to Section 7 of the Act permitting abandonment of his obligation under his certificate to continue interstate sales, or by way of specific price adjustment. The procedures should require that a petition for such relief present a prima facie case.

J. SCOPE OF THIS PROCEEDING

Paragraph (A) of the order instituting this proceeding provides that "A proceeding is hereby instituted to determine the just and reasonable rate or rates for the sales of natural gas produced * * *" in the Permian era, which are subject to the jurisdiction of the Commission. Persons listed in an appendix are designated respondents. This order encompasses the Permian rates of all such parties then on file or thereafter filed during the pendency of this proceeding. Respondents contend that, with respect to the listed parties, only the rates on file as of December 23, 1960, are in issue, and that rates subsequently filed by these parties which were not expressly consolidated are not within the scope of this proceeding. The plain language of the phrase quoted above covers all the rates of the listed parties including those filed after the institution of the proceeding. Respondents' contention is therefore rejected.

The rate schedules or certificate applications of persons not named respondents in the original or subsequent orders are not encompassed by this proceeding.

Paragraph (C) of the ordering clause of the Commission's order of December 23, 1960, consolidated into this proceeding various Section 4(e) proceedings concerned with suspended rates and refund claims thereunder, and Section 7 proceedings concerning certificate applications. The order instituting this proceeding was published in the Federal Register on December 30, 1960 (25 F.R. 13,998). It did not provide for the consolidation of Section 4(e) proceedings (rate suspensions) or Section 7 applications that might thereafter be filed by respondents to this proceeding. There may be Permian unconsolidated Section 4(e) and Section 7 certificate applications which involve retrospective rates. It is arguable that the parties have had constructive notice of the Commission's desire to meld all Permian rate and certificate matters into this proceeding, but publication in the Federal Register does not enlarge the scope of the Commission's order; it merely gives constructive notice of the scope that is actually contained in the order. Thus there is a question whether notice was afforded that action with respect to matters contained in Respondents' unconsolidated dockets was contemplated, if, in fact, it was. It is not impossible that with regard to such matters, additional evidence might have been adduced if the parties had been made more clearly aware of such an intention. If the Commission's order be construed to govern the unconsolidated Section 4(e) and Section 7 proceedings of the Respondents, then the express consolidation of the others was unnecessary. More importantly, with respect to unconsolidated dockets, there is a lack of jurisdiction in this proceeding over the subject matter. For these reasons, issues regarding retrospective rates which may be involved in the unconsolidated Section 4(e) and Section 7 proceedings are not governed by this proceeding. However, the prospective rates of the contracts included in these unconsolidated proceedings are subject to this proceeding by virtue of ordering clause (A) which includes all prospective rates of the Respondents in Permian.

K. REFUNDS

Refunds concern only the Large Producers because the area rates of Small Producers have been found just and reasonable. Refunds shall be determined in the following manner: For rates subject to refund, the allowed revenues at rates fixed herein and the actually collected revenues shall be determined for each year by category, i.e. by type of gas and whether old or new gas. Deficiencies in one category shall be used to offset excess revenues in other categories. If there is an excess of revenues after offset, the amount to be refunded shall be equitably apportioned among the appropriate sales under the rates subject to refund of the category in which the excess remains.

The rationale for this method is that in the first instance refunds should be determined on an area basis, the test being whether producers in the area have collected, over-all, excess revenues on sales under rates subject to refund. However, once it is determined on an area basis that refunds are payable, it is fair that producers in each category shoulder no more than their own burden equitably distributed.

The record does not now contain the information needed to determine refunds, *e.g.* the revenues for years other than 1960. Affected parties should submit draft orders with requests for information and specific proposals regarding refunds in consonance with the principles set forth herein within ninety days of the date of the issuance of this decision and the order attached hereto.

ADDITIONAL CONCLUSIONS

In addition to the foregoing conclusions, it is further found that:

(1) The Permian rates of the Small Producers herein are found just and reasonable and not unduly discriminatory or unduly preferential.

(2) The public convenience and necessity require that the certificate applications of the Small Producer applicants consolidated herein be granted on the same basis and for the same reasons as for the Large Producers; alternatively, upon petition filed within ninety days of the date of this decision, that said certificate applications be made pursuant to general certificates to be issued to Small Producers.

(3) The Permian area rates of the Large Producers are unjust and unreasonable; and their rates shall be determined in accordance with the rates and principles set forth in the preceding portion of this decision. No rates of any Large Producer are found unduly discriminatory or unduly preferential.

(4) Each producer applicant for a certificate of public convenience and necessity consolidated herein is a "natural-gas company" within the meaning of the Natural Gas Act as an independent producer of natural gas, as that term is defined in section 154.91(a) of the Commission's Regulations, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption and such sales together with the construction and operation of any facilities therefor are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act; each such applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder; the sale of natural gas as proposed by each such applicant herein together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor are required by the public convenience and necessity and a certificate authorizing the same should issue to each of them upon the terms and conditions of the order herein, which terms and conditions are required by the public convenience and necessity. The public convenience and necessity requires that the initial price charged by each such applicant for the sales proposed in his respective certificate applica-

tion consolidated herein be not greater than the rate set forth in the preceding portion of this decision for such contracts.

(5) All producers that intend to accept certificates issued in these proceedings shall file acceptances within ninety days of the date of the issuance of this order, stating whether they request them *qua* Small Producer or Large Producer.

ORDER

Wherefore, *it is ordered*, subject to review by the Commission, That the rates set forth in the foregoing decision be and they hereby are found to be the lawful rates with respect to the matters governed by this proceeding, and that the certificate applications herein be and they hereby are granted in accordance with the terms, conditions and principles hereinbefore set forth.

SEYMOUR WENNER,
Presiding Examiner.

APPENDIX A

ANALYSIS OF COST ESTIMATE OF NEW GAS WELL GAS OF CPUC WITNESS DORAN

CPUC witness Doran presented in Exhibit 222 an estimate of the 1960 cost of Permian gas produced from Permian gas and gas condensate wells. Doran uses Staff's exhibits and results thus:

a. The Staff used the so-called modified Btu method to allocate exploration and development (E&D) expenses between gas and oil. For E&D Doran uses the Staff's weighted average results of the Appendix B and C Respondents from gas and gas condensate leases. As will be discussed later, the modified Btu method would be more appropriately called the modified sales realization method. It is essentially a division of the joint E&D costs on the basis of the respective sales revenues, adjusted slightly for Btu content. It primarily reflects relative values, not the separate exploration costs of gas and oil.

b. For production operating expenses, Doran uses the weighted average of Staff results for the gas and condensate leases. For the condensate leases, Staff allocates the results between gas and liquids on the basis of its version of the relative cost method. In this method, the production operating costs are determined for a group of oil wells that produce no gas (the oil leg); similar results are obtained for a group of gas wells producing little or no liquids (the gas leg). The unit production operating expense of the two legs is then determined and applied respectively to the liquid and gas production of the condensate leases to obtain an allocation of joint operating expenses for the gas. This relative cost method may be an equitable method of allocating joint production operating costs. However, as Respondent witness Dr. Vietti shows, the costs of production for the joint product wells and leases are unrelated to their separate costs.

c. Doran determines his gross production investment by first determining the IDC (intangible drilling cost) per well for gas and condensate wells drilled in Permian during the period 1956–60. The IDC for condensate wells is allocated between gas and liquids on the basis of a relative cost factor reflected in Staff's Appendix B study. The book ratio between IDC and gross investment for 1960 for gas and condensate leases is then determined from the weighted results of Staff's Appendix B and C data. This ratio is applied to the average IDC per well to obtain the gross investment per gas and condensate well. As a consequence the DD&A (depreciation, depletion, and amortization) and the return allowance used by Doran reflect the Staff's use of the relative cost method applied to condensate wells.

After Doran had presented his exhibit, Respondent witness Turner showed that the Permian well count previously presented and on which Doran had relied was substantially underestimated. The use of Turner's more reliable figure for wells would reduce the average production per well and substantially increase Doran's unit cost per well.

Again, Doran's study is not geared to attaining a specific R/P ratio in the future, an essential factor in a study of current costs. Doran would probably have found it difficult to determine an appropriate R/P ratio for Permian because the ratio should reflect market and demand factors which go beyond Permian.

Doran's results reflect Staff's allocation of E&D to gas well and gas condensate well gas by the modified Btu method; his allocation of production operating expense, return, and DD&A allowance between liquids and gas from the condensate wells is governed by the results of Staff's relative cost method. These Staff allocations produce results which may be equitable divisions of the joint costs. As far as determining the separate economic cost, they are fictions. Doran's reliance on Staff's allocated data is so great that his results are too far removed from an economic cost determination for new gas well gas to be acceptable.

APPENDIX B

The Cost of New Gas Well Gas

In this appendix a detailed study is made of the estimates for the cost of new gas well gas presented by Distributor witness Roseman and Respondent witness Park. As mentioned in the text of the initial decision, a few of the estimates made by Respondent witness Sherwin will also be considered.

A. THE COST PER MCF OF DRILLING AND EQUIPPING SUCCESSFUL WELLS

The major component of the capitalized expenditures is the cost of drilling and equipping productive gas wells. Both Roseman and Park go about this by first determining the average cost per foot of sucessful wells drilled in 1960. They then estimate the current average gas well gas reserves added per year. Dividing the average cost per foot by the estimated gas well gas reserves added produces the average cost per Mcf for successful gas wells drilled.

For his determination of the average cost per foot for successful wells drilled in 1960, Roseman starts with the results of the U.S. Bureau of Census, *Census of Mineral Industries for 1958*. The Census data are based on more than 95 percent of the total footage drilled in 1958 and are the most complete figures available. They show the average drilling cost per foot for successful gas wells for 1958 as $17.93. However, there are no Census figures for 1959 or 1960. Roseman determines the 1960 figure by adjusting the 1958 Census figure downward by 5.8 percent on the basis of the 1958–1960 trend for gas and gas condensate well drilling costs shown for the results of the drilling costs of the Appendix A respondents. As discussed in the text, the Appendix A data shows the average national drilling costs for some 240 companies. The 1960 result for these companies shows a level of $22.24 per foot. That this sample is unrepresentative of the average drilling depth is indicated by the fact that the Appendix A respondents drilled 24 percent of the wells in the country for 1960, but accounted for 34 percent of the footage. Since the cost per foot is generally greater at greater depth, and since the Appendix A data are not sufficiently representative of shallow drilling the cost level shown is too high. However the Appendix A sample shows the results for an identical group of companies over a period of years, 1955–1960. Such a constant sample can provide a reliable measure

of trends even though it may not be representative of absolute levels. How the Appendix A sample may indicate trends is shown by the figures on average drilling depth. In 1958 the average depth of the gas and gas condensate wells drilled by the Appendix A respondents was 50 percent greater than the average depth of all such wells drilled in the United States by the entire industry. But between 1958 and 1960 the 7.3 percent increase in the average depth of such wells reported by the Appendix A respondents closely paralleled the 8.2 percent industry wide increase reported in World Oil. Thus the Appendix responses were representative of the depth trend although unrepresentative of the industry depth level. Again, the cost trends reported in the Appendix were similar for most types of wells and for almost all depth ranges. It is to be expected that the trends in the forces influencing drilling costs would operate generally over the various depths and for the various types of wells. While deeper drilling costs more than shallower drilling at any point in time, there is no reason to expect that over a period of time the cost of drilling deeper and shallower wells should not move in the same direction. It is reasonable to believe that during the oil boom years 1955–57 the industry called forth the services of less efficient operators and less efficient equipment. With the passing of the boom, it is reasonable to expect that the industry would be in a position to satisfy its drilling demand with the services of the more efficient lower cost operators and equipment, and that average drilling costs would therefore decline. Since the Appendix A data show that the cost per foot for drilling gas and gas condensate wells declined by 5.8 percent between 1958 and 1960, Roseman adjusts the Census figure for 1958 downward by this percentage to $16.89.

Sherwin, like Roseman, starts with the Census figure for 1958, but raises it by 5.6 percent on the basis of the IPAA drilling cost index. This index is not as reliable an indicator of the trend of costs since 1958 as the actually experienced results shown in Appendix A because of its reliance on posted prices. During a period of price weakness the list prices of industrial products do not reflect available discounts obtainable by negotiation. In contrast, the Appendix A data show the drilling costs over the years experienced by a large group of companies, resulting from their actual payments to drilling contractors or incurred by their own operating departments. These actual costs compared from year to year are superior to the IPAA index as an indicator of the trend in drilling cost over this recent period.

Park uses the *Joint Association Survey* (JAS) figure for 1960 of $18.57 per foot (The Joint Association Survey is a survey conducted by three industry trade groups, the API, IPAA, and the Mid-Continent Oil and Gas Association). The survey is based on a questionnaire mailed to various companies. The companies are not selected on a random basis, and since filling out and returning the questionnaire is voluntary, there is a considerable amount of self selection. The sample is therefore not random. Analysis of certain of the results in the sample indicates that it is biased (in the technical sense) toward an overstatement of the characteristics of the large companies in the industry and an understatement of the characteristics of the small companies. Thus the average depth of wells in the survey is substantially greater than the average depth of the wells of the companies in the universe from which the sample is drawn; and the average revenue of companies in the sample is $21,000,000 compared to the average revenue in the universe, which is under $1,000,000. Typically, large companies drill deeper than small companies, and this is confirmed by the average depth of the sample. The JAS drilling cost figure used by Park reflects the bias in the sample toward the large companies, their deeper than average drilling and consequent higher cost per foot.

Both Roseman and Park use the *World Oil Annual Review* as their source for footage. Both also use virtually the same method for calculating the annual gas well gas reserve additions: gross reserves in any period are equal to changes in reserves during the period, plus the reserves withdrawn as net production during the same period. Roseman found no trend in the 1947–1961 reserves added per foot drilled, so he used the average for the whole period, 587 Mcf per foot drilled. Park, using 6-year moving averages, concluded that the recent productivity of drilling for the industry warranted the figure of 600 Mcf per foot drilled.

Dividing Roseman's cost per foot drilled of $16.89 by the 587 Mcf found per foot, he estimated a cost of 2.88 cents per Mcf of gas. Park's result is 3.10 cents per Mcf. Because Roseman's estimate of drilling cost is sounder than Park's, his estimate of 2.88 cents is accepted.

B. LEASE ACQUISITION COSTS

Park, Roseman and Sherwin estimate lease acquisition costs for gas well gas on the basis of the relationship between lease acquisition costs and successful well drilling costs.

Data on leasehold acquisition costs in relation to successful drilling costs are available from the Staff Appendices B and C, the *Joint Association Survey* and the Chase Manhattan Bank's *Annual Analysis of the Petroleum Industry 1961* (Chase). Ratios between leasehold acquisition costs and successful drilling costs cannot be computed from the Chase data alone because the Chase drilling costs include lease equipment costs which cannot be broken out. However, the Chase figures for lease acquisition costs are separate. Roseman used this data and related it to the trended Census drilling costs (the Chase-Census results). The ratios from the above sources are shown for recent years below.

There is difficulty in using the data on this subject.

1. Lease acquisitions vary considerably from year to year and are significantly influenced by Federal offshore lease sales at which large blocks are sold at irregular intervals, chiefly to large producers. As shown below, the expenditures for leaseholds by the small producers have been stable in relation to drilling costs, while the expenditures of the large producers have varied significantly. Given the variability in the ratios, it is desirable to consider the results

Ratio of lease acquisition costs to successful well costs (percent)

	JAS	Roseman	Staff summaries	
			Respondents over 10 million	Respondents under 10 million
	(1)	(2)	(3)	(4)
1955	36	36	N.A	N.A
1956	29	28	41	28
1957	N.A	20	27	23
1958	N.A	23	39	24
1959	30	28	43	28
1960	38	36	67	28
1961	26	24	N.A	N.A
Weighted average	33	[1] 26.4	42	26

N.A.=Not available.

for a number of consecutive years. The JAS does not report any results for 1957 and 1958. The Chase-Census figures are available over a span of years and the Appendix data covers 1956–60.

2. The JAS, the Chase data and the Staff Appendix results are based on limited non-random samples. As previously discussed the JAS results over-represent the large producers. The Chase data are based on a sample which is then expanded by the use of expert knowledge of the industry and judgment to produce industry wide results. While the Appendix figures reflect national data for the companies included, they are limited to Permian respondents. They do not include all Permian producers, nor even all Permian respondents. There are some 75 large natural gas producers in the country, a large producer being defined as one who made jurisdictional sales of over 10 million Mcf during 1960. The Appendix results cover 42 of this group, since it is limited to producers making jurisdictional sales in Permian. It also covers only 94 of some 300 remaining small respondents out of some 1,400 Permian producers.[1] On the item of expenditures for leases, the amounts spent by the 42 large producers are overwhelmingly greater than those spent by the 94 small producers. Since the Staff results are not statistically expanded, they are probably the most unrepresentative of the three samples, and overrepresent the large producers to a greater degree than the other two. The Staff on brief voices the view that the Chase raw data are not as reliable as the data in the Staff questionnaire because the latter is sworn to. There is no reason to infer that reports submitted to and scrutinized by the Chase economists are incorrect. The study is published regularly, distributed widely, and its authors have had the opportunity to improve its techniques on the basis of experience. Qualified economic witnesses in this proceeding examined this data before relying on it.

3. Representativeness is particularly important on this item of lease acquisitions because the large producers tend to have proportionately higher lease acquisition costs than small ones. Dr. Foster's testimony to this effect is confirmed by a comparison between the large and small producers in the Staff Appendices. For the years 1956–60, lease acquisitions for the 42 large producers averaged 42 percent of well drilling costs while they averaged only 26 percent for the 94 small producers. Thus lack of adequate representation of the small producers which exists in the JAS and Staff results tends to produce an overstatement of the ratio of lease acquisitions to well drilling costs. The same principle is applicable to the Chase-Census results to the extent that they are unrepresentative of small companies.

To relate lease acquisitions to drilling cost, Roseman estimated drilling costs for oil and gas separately from the Census for 1958 and trended these results on the basis of the Appendix A experienced costs from 1957–60. The per foot results for oil and gas were applied to the total footage drilled of oil and gas wells as reported in *World Oil*, to obtain the total drilling costs for each year. As previously discussed, trending the drilling data on the basis of the trends shown in the Appendix A is a sound method for determining trends in drilling costs. Trending the 1958 drilling costs downward increases the ratio of lease acquisition costs to drilling costs. Roseman then relates the industry wide lease acquisition data of the Chase analysis to the trended industry drilling costs. He considers the annual ratios from 1955–61 shown on page 399, and correctly found no trend. He then determines the weighted average ratio for the years 1957–60 to be 26.4 percent, which provides a representative sample

[1] Witness Abel lists 1,400 oil and gas independent producers as being in a Permian directory. This includes nonjurisdictional sellers. There are some 2,600 business entities selling under percentage type contracts in Permian.

of years in which lease acquisition costs were at high and low levels. Applying this percentage to his drilling cost of 2.88 cents per Mcf for successful gas wells, determined from the first step, yields 0.76 cents per Mcf.

Sherwin's estimate for the relationship between lease acquisition costs and successful well costs is in the range of 33 to 37 percent. He begins with the Appendix data which for the years 1956–60 average 42 percent for the large producers and 26 percent for the small producers. He also considers the lower estimates of JAS and Chase. JAS doesn't cover the years 1957 and 1958, which the other estimates show were the two lowest years in any of the series. It is evident from the preceding table that for all the years JAS is available 1955, 1956, 1959, 1960, 1961, its ratios are never more than two percentage points higher than the Chase-Census ratios.

Sherwin's major reliance is the Appendix data for the large producers. The ratios for these large producers are much higher than either the JAS or the Chase-Census ratios. The ratio of 67 percent for 1960 is 29 percentage points above the JAS figure for that year and 30 points above the Chase-Census ratio. This last variance is probably due in part to extensive purchases by large producers of offshore leases at the federal sales occurring that year. Such lease sales are in the main confined to large producers and their affiliates, and are generally in large amounts. These transactions are reflected to a greater degree in the Appendix results for the large producers than in the JAS or the Chase-Census results, because the national Appendix data underrepresent the small companies to a greater extent than the other two. Sherwin's upper limit of 37 percent is based in the main on an apparent trend in the results for the large Appendix producers for 1958, 1959 and 1960, 39 percent, 43 and 67 percent, respectively, although on other occasions he criticizes the use of Appendix data even for trending purposes. During this same period there is no trend in the ratios of the Appendix small producers. That three years is too short a period to establish a trend for this purpose is shown by the downward movement in 1961 for both the JAS and the Chase-Census ratios. In March 1962 there were large sales of offshore leases, and the 1962 data will probably reflect this, but the whole picture still indicates variability but no trend. Sherwin's estimate, being based largely on the least representative data, is rejected.

Witness Park combines his estimate for lease acquisitions with that for lease facilities. He estimates that these two items should amount to 50 percent of his already determined drilling costs per Mcf. Park's estimate is based in large part on his judgment and experience as an official of Texaco. He considered the JAS average results for these items for the years when this survey was published and the 1956–60 Staff average results for all Appendix B producers. Both show a ratio of 59 percent for lease acquisition costs and lease production facilities in relation to drilling costs. Park first adjusts this percentage downward to reflect the fact that lease production facilities are more extensive on oil leases. He then adjusts the percentage upward to a lesser extent to take account of the fact that gas wells are more widely spaced and drain a greater acreage than oil wells. These two judgment adjustments resulted in a net downward adjustment to 50 percent, of which Park assigns 40 percent for lease acquisitions and 10 percent to lease production facilities.

Park's 40 percent figure is higher than the JAS average ratio. Moreover, as previously noted, the JAS was not published for the years which the Chase-Census and Appendix ratios indicate were the two lowest in their respective series, 1957 and 1958. And, as previously noted, the JAS average is probably too high because it is overweighted by large companies whose acquisition costs are a higher proportion of well drilling costs than is true for the small companies. The average ratio for the years 1956–60 for all the Appendix B companies

is 42 percent. The upward bias in the ratios resulting from the unrepresentativeness of Staff's companies has been discussed.

Park's upward adjustment is based on his experience that the spacing of gas wells is typically wider than for oil and therefore uses more acreage. He also gives his opinion that gas acreage is not correspondingly cheaper than oil acreage. He cites no study or data in support of his conclusion. He does not appear to have considered the relative values of oil or gas prospects. Park does not mention the factor that the drilling cost for gas wells is typically greater than for oil wells because of the greater depth of gas wells. This would tend to offset the effects in the relationship of possibly higher acquisition costs for gas acreage.

The record contains a single study which indicates that the cost of lease acquisitions for gas has not exceeded those for oil. In Schedule 7 of his Exhibit 224, Roseman relates the capital accounts for lease investment to the investment in lease and well equipment plus drilling cost for successful wells, classified by lease types. In other words he takes the gross historical investment in lease acquisitions for successful gas and oil leases, and relates this amount to the corresponding gross historical investment in successful wells and lease equipment. The study shows that lease acquisition investment was 22 percent for gas leases and 20 percent for oil leases. There is no dispute that lease facility costs on successful oil leases are generally considerably greater than on gas properties. Hence it is probable that if the ratios were limited to the capital accounts for lease acquisition and successful wells, excluding the lease facilities, they would show that the ratio for gas leases was the same as or lower than for oil leases. In any event, the study indicates that the ratio of investment in lease acquisitions to total investment for successful leases is not significantly greater for gas than for oil. This study covers productive leaseholds only. The witness concludes that this limitation doesn't affect the comparison. There is no reason to expect that the respective ratios for oil and gas leases would be changed if leaseholds which are acquired and never go into production were to be included.

There is no evidence that recent investment in gas or oil leases would change the above ratios.

While not conclusive, this study indicates that it is a reasonable hypothesis that the ratio of lease acquisition costs to drilling costs is not significantly different for gas than for oil leases.

It is concluded that Roseman's estimate based on the Chase-Census ratio furnishes the most reasonable estimate for lease acquisition costs. Applying Roseman's ratio to his drilling costs yields 0.76 cents.

C. INVESTMENT IN OTHER PRODUCTION FACILITIES

In computing investment in other production facilities, Park and Roseman using different methods reach the same result, 0.31 cents.[2] The largest single item in this classification of costs is lease production facilities.

Neither Roseman nor Park estimate any salvage value on their capitalized costs, though it is reasonable to expect that there would be some. Roseman cites testimony which appears reasonable from producer witnesses in other cases indicating that this item would amount to 10–15 percent of the tangible investment. However, no allowance is made for this item.

D. PRODUCTION OPERATING EXPENSES

Roseman and Park derive their estimates of current production operating expense from the Staff Appendix data in Exhibit 149. It is necessary to use the Appendix figure as a source for this item as there is no published industry-wide

[2] Roseman originally estimated a cost of 0.18 cents. His subsequent adjustment to 0.31 cents requires a slight adjustment in the allowance for exploratory overhead and working capital.

data for this cost item. Using different methods, Roseman and Park compute direct and indirect expenses for this item by lease types and relate these amounts to the volume of gas well gas produced. Roseman estimates this item at 2.88 cents and Park at 2.62 cents. Roseman's higher estimate is accepted.

E. DRY HOLE COSTS

Roseman and Park divide dry hole costs on the basis of the relationship between successful oil and gas well footage averaged over a period of years. While this method might not be suitable for dealing with the dry hole costs of an individual company due to the variations in annual success ratios and productivity of successful drilling, as Respondent witness Porter showed, these variations tend to be minimized in the magnitude of the industry's total effort over a period of years. Therefore these witnesses' basic approach is sound on the industry level.

For the period 1955–60, Park determines the average annual dry hole footage and successful footage, separately for exploratory and developmental footage. This shows that 6.4 feet of dry holes were drilled for each successful exploratory foot, and 0.3 feet per successful developmental foot. These numbers are multiplied by the average annual gas footage, broken down between exploration and development, thus arriving at the total dry hole footage to be borne by gas well gas. The total is then multiplied by the JAS 1960 average cost per foot for dry holes. The result is divided by the average annual reserve additions of gas well gas to produce 1.56 cents per Mcf for dry holes. Park thus allocates dry hole costs in proportion to the relationship between successful gas footage and total successful footage.

Roseman also divides his dry hole footage between gas and oil in proportion to successful gas and oil footage, separately for "wildcat"[3] and other footage. He derives a combined ratio of 0.898 feet of dry hole per successful gas well footage as the weighted average for the period 1951–61. (The corresponding ratio for Park for the period 1955–60 is 0.891.) Then he takes the cost per dry hole foot drilled from the Census for 1958 and after adjustment computes the cost per Mcf of dry holes drilled.

Roseman makes three adjustments to the dry hole foot cost figure of $8.91, the Census figure for 1958.

The Appendix figures show a decline of 3.5 percent in dry hole drilling costs from the peak year 1958 to 1960. For the reasons previously given, it is appropriate to adjust the 1958 Census level by the trend actually experienced by the constant sample of companies in the Appendix. This adjustment reduces the cost per dry hole foot to $8.60 per foot.

Roseman makes a second adjustment to take account of the fact that gas wells are typically deeper and therefore more expensive than oil wells. Using the *Oil and Gas Journal* figures which show drilling footage by depth and by well type, and Appendix data which shows the Appendix cost per foot for 1960 in the various depth ranges, he finds that the average cost per foot of dry holes allocated to gas was 12 percent greater than it would have been, if depth had been disregarded.

Again, analysis of the figures allocated to gas by Roseman on the basis of successful wells at various depth ranges, indicates that the footage allotted to gas is 4 percent less than if, disregarding depth ranges, the allocation were made simply on the ratio of total successful gas well to oil well footage. This

[3] *World Oil*, on which Park and Roseman rely for allocating dry hole costs, provides a breakdown between "wildcat" and total drilling. It appears that the term exploratory as used here by Park corresponds to the term "wildcat" used in *World Oil*.

is a statistical indication that deeper wells tend to have a higher success ratio.[4] The combination of the second and third adjustments, an increase in cost of 12 percent for greater depth and a reduction of 4 percent for greater success ratio, results in an upward adjustment of 8.28 percent.

The adjusted cost per foot figure is $9.31 per foot which produces a cost of 1.42 cents per Mcf.

Roseman's trended Census cost per foot is preferred to Park's JAS cost. The JAS sample average cost reflects the overrepresentation of large producers, their deeper than average drilling, and consequent higher than average cost per foot. Roseman's adjustments which reflect the effects of depth and success ratios for gas wells are sound refinements. For these reasons Roseman's estimate of 1.42 cents is accepted.

F. GEOLOGICAL AND GEOPHYSICAL EXPENSES, LEASE RENTALS AND EXPLORATORY OVERHEAD

Roseman estimates the cost of geological and geophysical expenses and lease rentals on the basis of their relationship to lease acquisition costs. The Chase *Annual Analysis of the Petroleum Industry, 1961*, shows that these costs averaged 138 percent of lease acquisitions in the period 1957–60, the same source and period Roseman uses in computing lease acquisition costs. The percentage relationship, 138 percent, is applied to the 0.76 cents lease acquisition cost to derive the cost of 1.05 cents per Mcf cost for the geological, geophysical and lease rental costs.

Roseman calculates exploratory and developmental overheads on the basis of the relationship between overhead and total finding and development costs. The ratio is derived from the 1959 JAS, which is the only published source of such data. The percentage is 8.4 percent. Applying this percentage to his total finding and developmental costs (3.95+1.05+1.42) yields 0.54 cents per Mcf for overhead. The combined figure for geological and geophysical expense, lease rentals, and overhead, is 1.59 cents.

Park combines geological and geophysical expense, lease rentals, and overhead into a single item, called other exploratory expenditures. Using a ratio of one to one with the dry hole exploration expenses based on the JAS 1960 survey, his result is 1.56 cents, slightly lower than Roseman's.

The witnesses' allowances for this item are virtually identical and Roseman's higher estimate is accepted.

G. ADJUSTMENT OF NET PRODUCTION TO MARKETED PRODUCTION

Park adjusts his costs upward by 5 percent to take account of gas well gas production he believes will be lost, vented, flared, or consumed on the lease, and therefore not productive of revenue.

The five percent factor is derived from a comparison of the total net production of all gas (including oil well gas) as reported by the AGA, and the total marketed production as reported by the Bureau of Mines for the six-year period ending in 1960. Examination of the annual results of these two surveys indicates that there has been a declining trend in recent years in the difference between the results of the two surveys; in 1960 the difference was only 2.5 percent compared to the 7.5 percent difference in 1955. More importantly, the annual reports of the Texas Railroad Commission and the Louisiana State Conservation Commission for 1960 show that in these states, which produce three-fourths of the

[4] This is not a conclusion that the success ratio at greater depths is higher. It is a conclusion that the success ratio for wells drilled to greater depths is higher than for wells drilled to shallower depths. This is to be expected: on the average, deeper wells go through more or deeper layers of earth and will tend to have a greater chance of hitting pay at one of these levels.

gas well gas produced in the United States, the amount of gas well gas vented and wasted was negligible, considerably less than one-tenth of one percent.

Park attributes some of the 5 percent loss to lease uses, for heaters, compressors, etc., but he does not quantify the portion or furnish any details to support this conclusion.

The instructions in compiling the Appendix data were that respondents who charged gas consumed on the lease to production operating expenses, should also report these volumes in their production. Roseman (and Park), as previously discussed, bases his estimate of production operating expense on the Staff Appendix data. In doing so he considers the volume of gas consumed on the lease to be charged to production operating expenses.

Schedule K of Staff exhibit 149 shows the breakdown of the producer's (net working interest) production volumes under headings such as: gas delivered to plants, gas sales to outside interests, lease and other field consumption, and a general category entitled nonsegregated volumes. This last category covers production volumes whose disposition is not otherwise specifically identified. For production from gas and gas condensate leases, the nonsegregated volumes amount to some 20 percent of the total net working interest production.

Respondents raise the possibility that not all lease consumption volumes were reported as production and concurrently had their value charged as production operating expense. In this event, they argue, there would be a disparity between net production and marketed production for which an extra cost allowance should be made. As evidence of the fact that a substantial part of the gas consumed on the leases was neither reported as production volume nor charged against expenses, they show that the Appendix ratio of gas reported as consumed on the lease to total net working interest production volume was only 0.57 percent for gas and gas condensate leases. This calculation ignores the substantial amount of reported but nonsegregated production, and implicitly assumes that no part of the nonsegregated gas production represents gas consumed on the lease. A more reasonable assumption is to apportion the nonsegregated volumes to the various specificially identified volumes. Restating the Respondents' calculation on this basis, the ratio of gas used on the lease to net working interest production as shown in Exhibit 149 is between 0.7 and 0.8 percent.

The annual reports of the Oil and Gas Division of the Railroad Commission of Texas for the period 1959–62 inclusive [5] show that, for gas well gas, fuel system and lease use accounted for the following percentages of total gas well produced: 1959, 0.75; 1960, 0.70; 1961, 0.76; 1962, 0.69.[6] These results indicate that Respondents in answering the questionnaire listed gas consumed on the lease in their reported production volumes. Respondents do not seem to argue that where volumes were reported, the corresponding charge to expense was not made.

The amount of gas well gas vented and wasted is negligible. With respect to gas consumed on the lease, the Staff Appendix data used by Roseman and Park in determining their unit production operating expense include the appropriate charges for this item.

H. REGULATORY EXPENSE, ROYALTY PAYMENTS AND WORKING CAPITAL

Neither Roseman nor Park show an allowance for regulatory expense. The Staff cost of service estimates show 0.14 cents as the allowance for this item for 1960, and this figure is adopted.

---

[5] Texas Railroad Commission, *Oil and Gas Division Annual Reports 1959*, p. 29; 1960, p. 31; 1961, p. 27; 1962, p. 31.

[6] Roseman's rough estimate on cross-examination that the ratio for gas and gas condensate leases was between one and two percent is thus seen to be too high.

For royalty payments Roseman and Park both use 12.5 percent, which is accepted.

Roseman includes in his rate base a working capital allowance reflecting materials and supplies and one-eighth of operating expenses, pursuant to the Commission's pipeline formula. This comes to 1.63 cents per Mcf.[7] Park makes no estimate for this item. Respondents criticize the formula as inadequate but offer no specific alternative. Roseman's estimate is accepted.

I. ALLOWANCE FOR GROWTH

Due to the continuing growth of demand, more gas must be found each year than is produced in order to maintain the R/P ratio at a desired level. Consequently, an allowance for growth must be added to the exploration expense for gas.

It has previously been determined that a national R/P index of 17.5 years would be an appropriate level to reach in 1970. To achieve this requires a findings to production ratio of 1.37 (omitting any requirement for maintaining a reserve against reserves in storage). This means that annual reserve additions will have to be 1.37 times annual production. Since Roseman's exploration expenses are 3.01 cents per Mcf found (1.42 cents for dry hole costs plus 1.59 cents for geological and geophysical expense, lease rentals, and other exploratory expenses), the allowance for growth must be 37 percent of this amount, or 1.11 cents per Mcf.

Achieving an R/P ratio of 20 years would require a finding ratio of 1.66 to 1 or a cost of 1.99 cents for Roseman. Park's estimate is based on maintenance of a 20-year R/P ratio and a 1.67 finding ratio. This results in a cost of 2.15 cents under Park's exploratory costs.

J. LIQUID CREDIT

Gas condensate wells produce a certain amount of lease condensate liquids which yield revenue to the producer. Thus the producer in making expenditures for gas wells can antiticipate revenues from these liquids as well as from the gas. Both Park and Roseman credit the lease liquid revenues against the cost of gas.

Park, using the Staff Appendix B data, determines for 1960 the average price and volume of lease condensate produced from gas and gas condensate leases, excluding the condensate from combination leases. The resultant gross lease condensate revenue per Mcf of gas well gas is 3.71 cents.

Roseman uses the average price per barrel for 1960 for all condensate produced by the Appendix B respondents, $3.03. He then considers four estimates of national condensate production for 1960:

	Million barrels
The American Petroleum Institute	82.1
The Oil and Gas Journal	82.9
Oil Scouts Yearbook	93.8
World Oil	94.0

These different estimates of national lease condensate production yield average lease condensate revenue ranging from 2.64 cents to 3.04 cents per Mcf. Roseman selects the lowest, 2.64 cents, which is based on the API estimate.

The lease condensate production reported by the Appendix B Respondents is well over half of national production, although their reported gross production

[7] Roseman's Exhibit 224 shows an allowance of 1.616 cents. Thus should be corrected to reflect his adjustment in cost of other production facilities.

of gas from gas leases is only about one-third of total national gas well gas production. It is evident that the respondents in this case produce disproportionately large amounts of lease condensate relative to their gas production. This is reflected in Park's estimated credit of 3.71 cents for lease condensate revenue per Mcf for 1960 derived from the Appendix results, compared with the results based on national published lease condensate production for the same year, 2.64–3.04 cents per Mcf.[8] Since the purpose of these estimates is initially to determine the national cost of gas well gas, the use of the published national production data to determine the lease condensate production is sounder than using the Appendix data.

The increasing trend in lease condensate production is shown by the following results from the *Oil and Gas Journal*, whose 1960 figure is slightly above that for the API:

Year	*Condensate production in million barrels*
1956	45.3
1957	51.0
1958	58.4
1959	69.6
1960	82.9
1961	92.8
1962	101.7

The gas well gas production figures for 1961 and 1962 can be calculated in the manner used by Roseman to determine his gas production for 1960 and other years (Park uses an almost identical method).[9] These gas well gas production figures for 1960, 1961 and 1962 can then be related to the 1960, 1961 and 1962 lease condensate production figures from the *Oil and Gas Journal*. Assuming the 1960 figure used by Roseman for the price of lease condensate, the following lease condensate revenues per Mcf are derived: 1960, 2.67 cents; 1961, 2.89 cents; 1962, 3.08 cents.

In view of the fact that the *Oil and Gas Journal* production figures are in the lower range of the published national production data, it is concluded that 3 cents per Mcf is a reasonable estimate for lease condensate.

From the gross lease liquid revenue there must be deducted royalty of 12.5 percent and production tax. Roseman makes no allowance for tax. Park determines a net credit of 3.07 cents after deducting royalty and production tax from 3.71 cents, indicating that royalty and tax amount to 17.25 percent.[10] Applying this percentage to the 3.0 cents estimated total lease liquid revenue and adding the 0.2 cent plant liquid revenue produces 2.68 cents as a net liquid credit. (For discussion of plant liquid revenue, see following page.)

The logic of crediting the revenues from the liquids is that the producer can reasonably expect that, from a proposed expenditure in the generally directional search for and production of gas well gas, he will receive revenue from the liquids as well as from the gas. Thus he may count against his prospective total cost the expected revenues from the liquids. The remainder represents the revenues to be derived from the gas if the total costs are to be met, and is the cost burden that has to be borne by the gas. Since the price of lease condensate has been

[8] Sherwin's estimate of 3.7 cents for lease condensate credit is also based on Appendix data.

[9] 1961, 9,740 million Mcf; 1962, 10,000 million Mcf.

[10] Thus the production tax is roughly 5 percent.

relatively stable in recent years[11] and since the credit amounts to only sixteen percent of the price for new gas well gas adopted herein, it is not likely that changes in the price of condensate will produce significant swings in the price of gas. In these circumstances, crediting the liquids is reasonable for the purpose used here.

Part of the gas well gas is also processed at plants to produce additional liquids and the producer shares in the revenues from these liquids, usually on a percentage basis. Park makes no allowance for these plant liquid revenues on the grounds that these revenues would have "a negligible effect on the price level necessary to satisfy the producers' financial requirements." He gives no analysis of the factors involved and his conclusion rests on his judgment. Roseman presents a detailed and reasonable analysis showing that if the producer receives only 20 percent of the liquid revenues, he would receive revenue of approximately 0.4 cents for each Mcf of gas well gas produced.

The ratio of total nonassociated liquids to gas well gas has been rising in the post war period, and rapidly during the period 1955–61. Only part of this increase is explained by the increase in lease condensate, leaving the balance to be accounted for from a rising trend in plant liquids.

The Distributors and Texaco, Park's sponsor, stipulated that, for purposes of this case, in the computation of a national cost for gas well gas, a credit for plant liquids might be used in the range of 0.1 cent to 0.2 cents per Mcf of gas well gas produced. Roseman's analysis and the increasing trend in plant liquids suggest that the stipulated figures are conservative. Accordingly the upper limit of the stipulation, 0.2 cents per Mcf, is accepted as the appropriate plant liquid credit.

K. PRODUCTION TAXES

It is arguable that it would be appropriate to use the national average of state production taxes because the effect of such a tax is similar to a cost. Park uses a 7 percent rate in his estimate, but there is no detail to support the figure. Respondent witness Hudson uses a 7 percent tax which he feels approximates the national average, relying in part on the taxes in Louisiana and Texas. Doubtless the production taxes of other states can be ascertained. But it would be proper to weight the average taxes before using them as a national figure. The lack of this evidence throws the balance to the use of a Permian figure.

Staff uses a weighted average of the New Mexico and the Texas taxes of 6.25 percent. In 1963, the New Mexico tax was increased. Staff disregards the change as negligible. While the change will not affect production during 1960, it represents a known change of sufficient amount to warrant consideration. Accordingly, a production tax allowance of 6.42 percent which takes the change into account will be used.

L. FEDERAL INCOME TAXES

Respondents do not recommend an allowance for federal income taxes.[12] Staff witness Lyon shows that if the industry's growth is considered there will be no federal income tax liability on finding and producing gas at any return up to 15 percent. Lyon's analysis is accepted as reasonable.

---

[11] Average prices for lease condensate were: 1954, $3.01 per barrel Census; 1958 $3.05, Census; 1960 $3.03, Appendix B.

[12] Respondent witness Carney includes computations for income taxes on gasoline plants in his exhibits. Most gasoline plants in Permian are owned by integrated companies, their subsidiaries, or their affiliates.

APPENDIX C

The Cost of Finding Old Gas Well Gas

The purpose of this analysis is to compare the average finding cost of old gas well gas (the gas produced in 1960) with the cost of finding new gas well gas (the reserve additions found in 1960). The general procedure follows these main steps: (1) the total volume of gas well gas produced in 1960 is distributed by estimated year of discovery; (2) the volume associated with each year of discovery is weighted by an index of drilling cost per Mcf for that year 1960=100); and (3) the results are totaled and then divided by 1960 production, thereby deriving a weighted average finding cost for the gas produced in 1960 relative to the finding cost of gas well gas found in 1960. The basic data for this analysis consists of: (1) Production of gas well gas for 1960; (2) estimates of annual additions to gas well gas reserves; and (3) indices of annual drilling costs per Mcf of reserves added.

There are two basic estimates in the record for the amount of gas well gas production in 1960, Distributor witness Dr. Joskow's of 9,420 million Mcf, and Respondent witness Park's, 9,594 million Mcf.[1] Both employ substantially the same method. Dr. Joskow's lower figure will be used, as for this purpose the lower figure is more conservative. The record also contains two basic estimates of annual additions of gas reserves, one by Respondent witness Dr. Foster and a second by Dr. Joskow.[2] The record also contains two annual indices of drilling costs per Mcf of reserves added, Dr. Foster's "Trend of Drilling Cost per Mcf of New Natural Gas Supplies," and Dr. Joskow's "Index of Drilling and Equipping Cost per Mcf of Natural Gas Reserves Added."[3] Since both of these indices show the trend in cost per Mcf of reserves added, they tend to reflect changes in productivity as well as changes in the price level. For this reason they are more significant than indices which merely show changes in the price level.

It is estimated that the depletion period is twenty years with a constant rate of take. This means that five percent of each year's estimated additions to reserves is produced in each of the succeeding twenty years. A longer depletion period would involve costs of an earlier period which were lower; hence, the twenty-year period is a conservative element in this respect. It is also estimated that a one-year lag occurs between discovery of reserves and production. With a one-year lag the twenty-year period 1940–1959 inclusive is used. The reasons for the selection of a twenty-year depletion period and a one-year lag have been discussed in connection with the costing of new gas well gas.

Since there are separate estimates for annual reserves added and for the drilling indices, two separate statistical series are used. The table on page 390 show the results based on Dr. Foster's data, and the table on page 391 shows the results based on Dr. Joskow's data.

---

[1] Respondent witness Dr. Sherwin's estimate of 9,591 million Mcf is calculated on a basis similar to Park's.

[2] Exhibit 116, Schedule 7. Method 1 shows Dr. Foster's results, Method 2, Dr. Joskow's. Park's estimates are based on a method similar to Dr. Joskow's and his results are similar to the latter's.

[3] Exhibit 26, Schedule 7 and Response of California Interveners to Presiding Examiner's Request for Information, dated April 22, 1964, last page, column 4. This last index was derived from Dr. Joskow's deflated cost index originally submitted in Exhibit 116, Schedule 8.

Columns (1) in the tables show the respective estimates of Drs. Foster and Joskow for reserve addition for 1947–1959.[4] Columns (2) show five percent of each year additions; these amounts represent the contribution to 1960 production from the reserve additions in prior years, starting with 1947. The percentage distribution of 1960 production by estimated year of discovery is shown in columns (3) in each table. Columns (4) present the two series of drilling cost indices expressed on the basis of 1947–1949=100. These indices are converted to a 1960 base, as shown in column (5), by dividing the index value for each year by the corresponding value in 1960.

Weighted average cost index (Foster) of gas well gas produced in 1960, United States (1960=100)

Year	Foster estimated reserves of gas well gas added			Foster index of drilling and equipping cost/Mcf reserves added		
	Billion Mcf	Assumed 5 percent take, billion Mcf	Percent contribution to 1960 production	1947–49=100	1960=100	(1960=100) weighted by column (3)
	(1)	(2)	(3)	(4)	(5)	(6)
1947	7.284	0.364	3.86	95.0	50.6	195.316
1948	8.206	.410	4.35	100.8	53.7	233.595
1949	7.892	.395	4.19	104.3	55.6	232.964
1950	8.206	.410	4.35	108.7	57.9	251.865
1951	9.432	.472	5.01	116.7	62.2	311.622
1952	10.222	.511	5.42	124.9	66.6	360.972
1953	15.509	.775	8.23	132.4	70.6	581.038
1954	5.289	.264	2.80	139.7	74.5	208.600
1955	17.711	.886	9.41	147.2	78.5	738.685
1956	20.390	1.020	10.83	156.6	83.5	904.305
1957	16.480	.824	8.75	169.4	90.3	790.125

With regard to the reserves added during the years 1940–1946 inclusive, the amount contributed to 1960 production for these years is taken as the difference between the sum of the annual contributions from 1947–1959 and total 1960 production of gas well gas. To obtain cost index values for the period before 1947, the year Dr. Foster's drilling index begins, and before 1948

[4] The contributions of annual reserves to 1960 production include extensions and revisions to data of reservoirs found earlier. Although no provision can be made for the earlier and lower cost of the reserves found applicable to extensions and revisions, their inclusion in this time series in the year in which they are reported is a conservative element.

Weighted average cost index (Joskow) of gas well gas produced in 1960, United States (1960=100)

Year	Joskow estimated reserves of gas well gas added			Joskow index of drilling and equipping cost/Mcf reserves added		
	Billion Mcf	Assumed 5 percent take, billion Mcf	Percent contribution to 1960 production	1947–49=100	1960=100	(1960=100) weighted by column (3)

for Dr. Joskow's index,[5] estimates are made by assuming that the drilling cost index for the earlier period moved proportionately with each of these alternative Bureau of Labor Statistics Wholesale Price Indices: (1) All Commodities; (2) All Commodities other than Farm Products and Processed Foods; (3) Metals and Metal Products; and (4) Iron and Steel. The extrapolated indices for the indices for the years prior to 1947 are weighted by the proportion of 1960 gas attributable to gas well gas found in these years.

The product of the cost index multiplied by the relative proportion of 1960 production is given in columns (6) in each table. Dividing the sum of these products by 100 gives the weighted average index of the finding cost for gas well gas flowing in 1960 relative to 1960 costs which are represented by an index value of 100.

The results using the four indices are shown in the lower section of each table. For Dr. Foster's data, shown on page 390, the finding costs of flowing gas are estimated at 69.1 percent, 69.5 percent, 69.5 percent, and 69.7 percent respectively, of the finding cost of new gas well gas cost. For Dr. Joskow's data, shown above, the results show that the estimated costs of gas flowing in

[5] In the Joskow series, the 1947 figure is not comparable with the index for subsequent years. To approximate comparability the extrapolation to the earlier period covered the period 1940–1947, as opposed to the 1940–1946 period for the Foster series.

1960 are 74.3 percent, 74.9 percent, 74.4 percent, and 74.4 percent of the cost of new gas well gas, respectively. It is apparent that the results are similar regardless of which cost index is used for the extrapolation of costs prior to 1947 or 1948.

APPENDIX D

The Historical Cost Presentations

In the text of this decision the Examiner finds that only the costs of gas well gas are reasonably determinable, and that other gas should be priced primarily on the basis of its relative value to flowing gas well gas. Several of the parties have presented historical cost studies of oil well and residue gas. While these methods have been rejected as lacking in probative value, it is proper that they be analyzed. This will be done in this Appendix.

In discussing these historical cost studies, the main problem concerns the division of the joint costs between oil and casinghead gas, between gas well gas and lease condensate, and between residue gas and plant liquids.

Staff presents a historical "cost" study of each type of gas, which is the crux of its pricing system. Respondents contend that the "costs" of finding and producing gas are indeterminable and should not be used as the basis for determining the price of gas, though they concede that the cost of gas well gas may be determined with a greater degree of reliability than that of gas produced jointly with oil. But if historical "cost" is to be sought, as rebuttal they argue that their methods of allocation should be adopted. CPUC and Distributors accept Staff's historical "cost" basis for pricing all gas, except residue gas. They submit their own gasoline plant cost studies. Warren also submits gasoline plant cost studies, though these seem to be submitted essentially as rebuttal to the Staff presentation.

In this the first area rate case methods must be considered afresh. Precedents used in the few individual producer rate cases[1] thus far decided cannot be applied here without consideration of their relevance and validity on an industry or area basis, where circumstances may be different. The analysis which follows takes into account these different circumstances.

A. Representativeness of the Appendix Questionnaires

The data in the replies to the cost questionnaires submitted by the Respondents are the basis on which Staff develops its cost presentation. Replies to Appendix B questionnaires, intended for Respondents having 1960 continental jurisdictional sales in excess of 10,000,000 Mcf, were filed by 68 respondents, 43 whose 1960 jurisdictional sales volumes were in excess of 10,000,000 Mcf, plus an additional 25 respondents whose volumes were less. Of the total of 68 replies to the Appendix B questionnaires, 67 were used by the Staff, as one of the producers having sales in excess of 10,000,000 Mcf did not fill out the form in a way that it could be used.

The Appendix C questionnaire was a simplified form designed for producers having less than 10,000,000 Mcf of continental United States sales. Replies to Appendix C questionnaires were filed by 105 respondents, but Staff used only 69 of them. Thus Staff exhibits reflect data from 67 Appendix B respondents and 69 Appendix C producers, a total of 136 out of the 361 named Respondents.

---

[1] *Phillips Petroleum Company*, 24 FPC 537 (1960) which was followed by *Continental Oil Co.*, 27 FPC 96 (1962); *Hunt Oil Company*, 28 FPC 623 (1962); and *H. L. Hunt*, 28 FPC 897 (1962). In the last three of these cases, the Commission relied substantially on the principles of the *Phillips* case.

With respect to drilling costs, which are shown in Appendix A, responses were received from 249 producers.

Staff's cost evidence covers some 75 percent of Permian produced gas and 52 percent of the nationally produced gas.

Under section 154.91(e) of the Commission's Regulations under the Natural Gas Act, producers selling to gasoline plants under percentage contracts are not permitted to file rate schedules, since the sale to the pipeline is covered by the rate schedules filed by the gasoline plants. Some 2,280 of these producer selling entities operating as percentage sellers in Permian are not parties to this proceeding; they sell considerable volumes of gas to Permian gasoline plants which, in turn, make jurisdictional sales. The Commission simply regulates the price of the final product, residue gas; the arrangements between the percentage sellers, their share of the gas and liquids extracted, the amounts of gas to be returned free to the lease, etc., are left to the bargaining of the parties. Many persons are listed as having interests in several percentage selling entities so that, while still large, the list is in part duplicatory. Also an industry directory lists some 1,460 local explorers and producers in Permian, but this list includes non-jurisdictional producers, and may also include percentage sellers.

It is evident that producers having sales in excess of 10,000,000 Mcf are well represented with respect to Permian production. The percentage coverage of the small producers is not large nor is the sample random. Its representativeness is therefore questionable for this group. For these reasons the weight of this evidence bearing on this group is attenuated.

The sample of Respondent witness Allen with respect to developmental drilling costs covers 23 out of 46 Appendix B and C producers to whom the questions were submitted and 73 percent of the dry hole costs of the Appendix B and C producers. This sample suffers from three sampling defects: It was sent to only 46 Appendix B and C respondents; there were responses from only 23; and there was self selection among those who chose to answer. These factors diminish the weight that can be accorded to this evidence.

In contrast, the data used by Messrs. Park and Roseman for new gas well gas was in most significant instances based on national survey data, and is therefore more representative.

B. COMMON COSTS

Respondents in their Appendix B and C questionnaires reported their costs and investment by six lease types: oil only, gas only, combination, oil casinghead, gas condensate with lease separation, and gas condensate without lease separation. Thus the Appendix data itself is the product of considerable judgment.[2] In addition, included in the data submitted in the Appendices was a considerable amount of common costs and common investment, items such as corporate and district overhead and investment, prepayments, materials and supplies, etc. These items have to be allocated to the various lease types.

Staff allocates corporate general expenses, district expenses and prepayments on the basis of the direct lease expenses. Respondents allocate these items on the basis of direct and indirect lease expenses plus DD&A. Respondents' method allocates a greater percentage to gas leases.[3] Here the common costs involve in the main supervisory expenses for the leases. It is reasonable to relate

[2] *E.g.* the U.S. Continental data for gas condensate leases without lease separation includes a considerable amount of lease separated condensate.

[3] In costing new gas well gas both Distributor witness Roseman and Respondent witness Park derive their allowance for production operating expense from Appendix data. Roseman allocated overhead expenses on the basis of direct lease costs plus DD&A, whereas Park based his allocation on direct lease costs. Applied to new gas well gas, Roseman's method produced a slightly higher result.

supervisory expenses to the direct expenses being supervised. DD&A are simply bookkeeping charges that do not require central office supervision.

Staff allocates common investment, *e.g.*, corporate and district investment and the materials and supplies portion of working capital on the basis of the relative gross investment in the leases. Respondents contend that these should be allocated on the basis of net investment. Since the average depletion of the oil leases is greater than that of the gas leases, the use of net investment increases the costs allocated to gas. Here again we are dealing with supervisory investment, which is not substantially affected by depreciation or depletion of other properties. Moreover net investment is a less reliable figure because of the frequent revisions in estimates of reserves which affect the depletion rate. Finally, the need for materials and supplies is not reduced as the property is written off on the books; maintenance continues with operations. Staff's use of gross production investment as the basis for allocating common investment is therefore accepted as reasonable.

C. ALLOWANCE FOR JOINT EXPLORATORY AND DEVELOPMENT COSTS

Exploratory and development costs (E&D) cover principally dry holes, geological and geophysical expenses, lease rentals, cancelled and surrendered leases. In industry accounting practice these items are generally expensed as they are incurred. The purpose of the E&D allocation is to divide the total E&D expenditures among the leases and the products thereon: oil, lease condensate, gas well gas, gas well gas from condensate wells, and casinghead gas.

Under almost any system of allocation which is used to determine an allowance for E&D as a part of the cost of gas produced in 1960, the allowance will be higher than the amount historically related to the gas flowing in 1960 for two reasons: first, gas flowing in 1960 was not found in 1960; it is the product of expenditures made in prior years when cost levels were lower; second, the dollars spent for E&D in 1960 were spent in the hope of finding reserves that would flow in future years. Since the industry is growing and finding more gas and oil than is being currently produced, the E&D expenditures in 1960 are higher than would have been required as part of the search for 1960 gas, even at unchanged price levels.

The Staff's method of allocating E&D in the main follows principles used by the Commission in Phillips. Essentially two ratios are determined[4]: first, Btu's in an average barrel of lease liquids to an average Mcf of gas; second, the price of an average barrel of lease liquids to the price of an Mcf of gas. The first ratio is then divided by the second. The result is called an economic factor. On a national basis for 1960 the over-all factor is 4.0; on a Permian basis the result is a higher factor, 6.3. A similar relationship between oil well gas and gas well gas on a nationwide basis gives a factor of 0.63. For Permian the relationship of oil well gas to residue gas, 0.508, is considered significant because residue gas is more common in Permian than gas well gas, and "because the price of residue gas delivered from oil-well gas is usually close to the price of gas well gas in the same area." (113/11,585.) The lower factor for Permian casinghead gas relative to residue and gas well gas results primarily from its lower sales value. On a judgment basis, after consideration of these ratios and other economic factors and trends, Staff witness Lyon concludes that for the lease products the following economic factors are appropriate for this proceeding: oil and lease condensate, 4; gas well gas (including gas from condensate wells), 1.0; casinghead gas 0.6. The national production of Btu's for the lease products by lease type is then multiplied by the appropriate factor: 4.0 for oil and lease

[4] Staff witness Lyon considered various other factors and trends, but in his final determination he seems to have focused on these ratios.

condensate, 1.0 for gas well gas, and 0.6 for oil well gas. Thus the higher the economic factor for oil, the higher the cost that is assigned to oil. The total national costs are then apportioned to the leases and to the lease products on the basis of the foregoing economic factors. These apportioned costs are then divided by the respective national volumes of the lease products, barrels for liquids and Mcf's for gas. This produces the national unit allowance for each lease product. These allowances are then imputed to Permian.

The rationale for this method is that it reflects the relative fuel values of gas and oil and also the relative market values due to the more valuable form of the liquids.

While the Staff method is termed a "modified Btu method" it is so heavily weighted by the relative sales realization of the products, that the term "modified sales realization" is a more apt characterization. A comparison of the results of the Staff method with the results under sales realization, while not conclusive, is illuminating. Both produce similar results for the United States: a split of E&D costs of 80 percent to liquids and 20 percent to gas; and for Permian: a split of 90 percent to liquids and 10 percent to gas. The reason the results are so similar is that the basic leverage in the "modified Btu method" is the sales value with only a slight variance attributable to the Btu. Moreover, sales realization also takes into consideration the relative values of gas well and casinghead gas just as the "modified Btu method" does. The latter method is quite close to sales realization, though its mechanics and application are more complex.

There are certain difficulties with using sales realization, or a method in which selling price is such a predominent factor, as a cost allocation method for E&D.

Relative sales revenues provide a sound way of allocating certain costs which are a function of sales: for example, general advertising relating to the good will of a company as a whole; or salesmen's salaries, if it is shown that the time spent on sales of different products approximates the amounts sold. But there is no showing here, nor is there any reason from the evidence presented to infer, that the relative sales values of oil and gas reflect their respective share of the total joint E&D costs.

Furthermore sales realization, or a modification heavily affected by it, as a cost allocation is circular: that is, the price for a substantial item is used to determine the cost of the item, which is used to determine the price. Also in the modified sales realization method proposed, the economic factors applicable in a subsequent rate proceeding will have been substantially influenced with respect to the gas side by the economic factors chosen here. For this reason the method would present difficulties if it were used in a subsequent Permian proceeding.[5]

This is not say that value should not be used as a factor in apportioning the costs of joint products—for burdening each of the joint products with a fair or equitable share of the total joint costs. But it does not reflect real costs

[5] It is recognized that an element of this circularity problem may exist in some degree with respect to the determination of the relative value of casinghead gas to gas well gas in a subsequent proceeding under the method proposed for pricing casinghead gas in the text. This problem concerns the relative value of Permian casinghead to gas well gas, not the determination of the absolute value of both gases, as the price for gas well gas in the text is anchored to an independently determined cost. The problem is not substantial here since only a small amount of Permian casinghead gas is sold as such. And absent a substantial change in factors such as the technology of processing or in the general quality of Permian casinghead gas, of which there are no indications in the record, no change in the casinghead-gas well gas relationship would be indicated.

An extreme instance of this type of circularity is present in the argument that the price for all gas should be determined on the basis of its value as a commodity, and that this value should be determined on the basis of the field prices for the gas.

except where it can be shown that the costs to be allocated are functions of the sales revenues. Staff's E&D allocation method must be recognized as one based primarily on value.

Respondents allocate E&D expenses as follows: As for developmental dry holes, they contend that this drilling has always been directional. Respondent Phillips sent a questionnaire regarding the amounts spent for dry holes which had been aimed at oil reservoirs and for dry holes aimed at gas reservoirs to 46 of the Appendix B and C Respondents. The sample was not random and there is a considerable degree of self selection in the responses. Replies were received from 23 Respondents covering the years 1956–60. These data account for 73 percent of the aggegrate developmental dry hole costs for the Appendix B and C companies. The results show that 33 percent of the developmental dry hole expenditures made by the 23 Respondents were aimed at gas reservoirs. Therefore Respondents allocated 33 percent of 1960 Appendix B and C developmental dry hole costs to gas reservoirs. If Respondents had allocated developmental wells on the basis of the IDC (intangible drilling cost) of successful developmental wells of all the Appendix B and C Respondents the percentage for gas would have been 23 percent. Respondents explain the difference on the ground that developmental drilling aimed at gas reservoirs has a lower success ratio than that aimed at oil reservoirs because of the wider well spacing on gas properties.

As for exploratory dry holes, Respondent witness Sherwin shows that for the years 1956–60 about 50 percent of the IDC of successful exploratory drilling was associated with successful wells which found gas reservoirs. Therefore Respondents allocated about 50 percent of the exploratory dry hole costs to gas reservoirs.

The remaining exploratory expenses, unclassified dry holes, geological and geophysical, lease rentals, abandoned leases, etc., were allocated between gas and oil on the basis of the cost of combined successful exploratory and developmental effort which resulted in finding gas reservoirs compared to oil reservoirs. The percentage of these remaining expenses allotted to gas on this basis is 27 percent.

For the E&D costs allocated to gas reservoirs, a further division is needed between the gas and the lease condensate production. Respondents use a volumetric basis, *i.e.*, for purposes of measurement the lease condensate is converted back to a gas and the costs are distributed on the basis of the respective vapor volumes of gas and condensate. Specifically, it is assumed that one barrel of condensate occupies about 1.1 Mcf. The explanation offered for this way of handling lease condensate is that the condensate is a gas in the reservoir, though it condenses immediately at the surface, whereas oil is a liquid in the reservoir. This distinction, however, has little cost significance.

The vapor volumetric method ignores the economic purpose of the driller. Deep gas reservoirs tend to be gas condensate rather than gas well gas reservoirs, and the likelihood of finding condensate in wells at depth is part of the driller's calculus.[6] One barrel of condensate is worth over $3.00, twenty times the value

[6] The national average depth of successful exploratory condensate and dry gas wells has been for the following years:

	Dry gas wells, feet	*Gas condensate wells, feet*
1956	4,993	9,309
1957	5,170	9,915
1958	5,323	9,640
1959	5,294	9,783
1960	4,974	9,479

Source: Lahee, Statistics of Exploratory Drilling in the United States, 1945–1960.

of an Mcf of gas valued at 15 cents. Under the vapor volumetric method each would be assigned approximately equal costs. The conditions under which the condensate and the gas are produced do not warrant such a result.

Finally, the E&D costs allocated to oil reservoirs by Respondents are further allocated between oil and casinghead gas on the basis of "a modified relative cost" method. As will be discussed below, this method does not reflect true costs. This variant of the relative cost method is not based on the development of costs for single product legs. Instead, the gas leg includes the dual product gas condensate leases with lease separation (using a vapor volumetric method for costing the lease condensate), and the oil leg includes the oil casinghead leases. A ratio is obtained between the total respective single and joint product costs for the oil and the gas legs and applied to split the oil well gas from the oil in the casinghead leases. Respondent witness Porter offers no explanation why a ratio obtained in this manner is meaningful for the purpose used. There is no probative evidence to show that it either reflects true costs or that it is "equitable."

Respondents' use of the successful efforts method to allocate exploratory dry hole costs between gas and oil reservoirs reflects cost elements to a greater extent than the modified sales realization method of Staff. But Respondents' vapor volumetric method and modified relative cost method to allocate between gas and lease condensate, and between casinghead gas and oil, respectively, are unsound.

Staff argues that there are extreme difficulties in classifying dry holes as either exploratory or developmental. This is no doubt partially true, and it will be noted that Respondent witness Keene includes a classification of unsegregated dry holes in his group of other E&D costs. While the problem is not without difficulty, the Staff questionnaire included a breakdown by type of exploratory and development wells. Moreover the industry has been classifying dry holes as exploratory or developmental for years.

Staff seems to criticize Respondents' allocation of dry hole costs on the ground that if it is valid, these costs should be related to reserves found, which is the objective of this cost occurrence. This same criticism is equally applicable to Staff's position that E&D should be charged against current production.

D. THE VARIOUS "RELATIVE COST METHODS" FOR ALLOCATION OF PRODUCTION COSTS AND INVESTMENT

The "relative cost method" is used to separate the joint production costs between the liquids and the gas on the joint product leases (the oil casinghead leases, the gas condensate leases with lease separation and the combination leases). The theory of the method is to determine the separate costs of producing oil on oil only leases, and of producing gas on dry gas leases; then the ratio of the two separate costs is used to divide the joint costs between oil and gas production.

It will facilitate analysis if the Staff method of applying the method is described first.

In developing costs for single products referred to as "gas and oil legs," Staff first excludes "shut-in" single product leases (for allocation purposes). It then divides the gas and oil legs into three costing centers: cash expense, DD&A, and return allowance. The joint product lease cash expense and the DD&A are allocated to gas and lease liquids on the basis of the single product unit cash expense and unit DD&A, respectively. However, the joint product return allowance is not allocated on the basis of single product unit return allowance (or on single product unit net investment which would give the same result), but on the basis of single product gross investment.

While the theory of the relative cost method appears easy to formulate, there are numerous controversies about its application, most of which stem from the different meanings the parties assign to the element of "comparability":

a. Do the single products have to be comparable, and if so, what is the test?

b. Must the single product leases be placed on a common basis for major economic and physical characteristics?

c. Must the single product leases be placed on a common basis with the joint product leases?

d. Must there be a comparability of production process between the single product leases and the joint product leases?

Some of the parties seem to vary their definitions with the particular issue, which adds to the complexity of the problem.

With regard to comparability of product, Staff includes in its Permian[7] gas leg the leases which produce only single products at the lease, *i.e.*, gas only leases and gas condensate leases without lease separation. It excludes gas condensate leases with lease separation from the gas leg because they produce two products at the lease. Respondents argue that gas condensate leases with lease-separation should be included in the gas leg because they are produced under conditions similar to other gas leases, and under conditions dissimilar to that of the oil casinghead gas leases. The basic distinction made by Respondents is that condensate is in the gaseous phase in the reservoir while oil is in the liquid phase. This argument has to do with problem (d) above: that there must be comparability of process. Two products, gas and lease condensate, are produced on gas condensate leases with lease separation, and for purposes of the relative cost method they should be treated as joint products.

With regard to comparability of major economic and physical characteristics, Staff argues that this is required under the method and necessitates two adjustments to the legs: the first is the exclusion of shut-in leases from the gas and oil legs for purposes of allocation. (The actual costs of the shut-in leases in the joint lease categories are not excluded from the costs when the allocations are applied.) There are shut-in leases on the joint product leases and each of the single product leases, but the percentage of shut-in leases is greatest on the gas leases. Staff's second adjustment is to allocate the joint product return allowance on the basis of single product gross investment rather than net investment, because "there are major differences regarding the state of depletion between the state of depletion of the single product and the joint product production categories." With respect to the single product leases, the oil-only leases are more depleted than the dry gas leases. Using net investment as the basis for allocation of the return allowances imposes a comparatively greater burden on gas than oil. Of course, the actual joint product return allowance is computed on net investment. The question here is what the allocation basis on the joint product leases should be.

Respondents argue that if the relative cost method is to be used, the conditions of production should be taken as they are: shut-in wells are an incident of oil and gas production and should be considered as they exist; the same is true, they contend, for net investment. This argument is inconsistent with Respondents' previous position that gas condensate leases with lease separation should be treated as single product leases because the conditions of production on both are similar and unlike those on joint product oil casinghead leases. Respondents further argue that if any adjustments are to be made, an adjustment should be made for the fact that the oil only leases tend to reflect high cost stripper wells,

---

[7] In its Continental U.S. gas leg, Staff excluded the lease condensate leases without lease separation because significant volumes of liquids are reported under this classification.

requiring pumping. On this last point, Respondents' grounds for adjustment are as sound as Staff's, though Respondents do not indicate what the adjustment should be, or how it could be made.

The real questions regarding these adjustments go to (a) the definition or the elements required for the relative cost method, and (b) the validity of the method itself, particularly in the light of the proposed adjustments.

If comparability with regard to the economic and physical characteristics of the single product leases and the joint product leases is an essential element of the method, then Staff's adjustments are required, along with a lot of others. But the relative cost method can technically be performed without these adjustments. And while the use of normalizing adjustments with respect to the single products is in consonance with the theory of the relative cost method, as a practical matter it is expedient to discard such added complications, as there is no end to them once begun.

Phillips' witness Cramer presents a variant of the relative cost method, referred to as the "Y" ratio method. He does not claim that his method indicates the real costs of any of the products. The method raises the special problems which underlie the use of the relative cost method such as shut-in leases and allocation of joint product return. It also requires that combination leases be treated as either gas leases or oil leases. Cramer in this case treats them as oil-casinghead gas leases. Staff's relative cost method relies on an allocation ratio based on single product costs. The "Y" ratio method includes in the base the cost and production of the joint products, which are the very costs to be allocated by the ratio to be derived. The results are worked out to a cubic equation which is solved with a computer. While the method may produce a mathematical solution, the assumptions behind it are no more valid than those back of Staff's relative cost methods. It further complicates an already complex situation, without adding validity to the conclusions.

The relative cost method of "costing" joint products is not a costing method. There is no evidence that the cost of producing oil from oil only leases and of producing gas from dry gas leases has any cost causal relation to the cost of producing lease condensate from gas condensate leases or of gas from oil wells. As Dr. Vietti, Respondent Texaco's witness shows, all these products are produced under different conditions, aside from the fact that they are discovered underground and brought to the surface through holes drilled in the ground.

Moreover the method can be and is applied with immumerable variations, each producing different results. A relatively small variation in the cost or volume of the single product leases can, because of the leverage effect of the legs, produce substantial shifts in the allocation of the joint product costs. The reasons for preferring one variation to another are tenuous, although the differences in results can be substantial. There is no indication that the results of the relative cost method are closer to the separate product costs of joint production than relative values related to the cost of old and new gas well gas. Nor is there any indication that they are more "equitable."

There may be hyperbole in Texaco's description of the relative cost method as the "villain of the piece." But there is merit to its charge that the method invites statistical manipulation to produce desired results.

The relative cost method is really not appropriate for the purpose used here. Its underlying philosophy is that single product production is the norm, and the joint cost situation the special case. But here oil production without gas is not the typical situation; and dry gas is yielding its place to condensate well gas as the great sources of new gas reserves are being found at depth.

E. GAS WELL GAS PRODUCED FROM COMBINATION LEASES

In allocating the production costs of combination leases, Staff uses a double-step method. It first allocates joint costs on combination leases between all lease liquids and all raw gas. It then allocates the raw gas costs so obtained between (1) oil well gas, (2) gas well gas, and (3) condensate well gas on the basis of (a) the unit "cost" of gas from oil casinghead gas leases (which figure was derived by previous relative cost allocation), (b) the unit cost of gas from gas only leases, and (c) the unit cost of gas from all condensate gas leases (which figure was derived in part by previous relative cost allocation), respectively.

After developing its costs of gas by type of gas and by lease class, Staff recombines the costs to arrive at a cost for gas well gas and for oil well gas. Its cost of gas well gas reflects a weighted average cost of gas from the gas only leases, gas condensate leases, and gas from gas only and gas condensate from wells on combination leases.

Respondents argue that the cost of gas well gas from combination leases should not be included in the cost of gas well gas. Instead they impute the cost of gas well gas on gas and gas condensate leases to the cost of gas well gas on combination leases. In Permian, gas well gas from combination leases amounts to some 35 percent of total gas well gas production. The gas well gas from combination leases is gas well gas and should be included in determining the cost of gas well gas. The costs on the combination leases are joint and result in some economies. There is no reason not to reflect this saving in cost.

F. RELATING COSTS TO VOLUMES PRODUCED

Some of the raw gas produced is reinjected into oil or gas condensate reservoirs to produce a greater recovery of liquids. Staff spreads its total costs among all units produced, including volumes reinjected. Under this method the liquids which are benefited bear the cost allowance for the reinjected gas. Thus the cost of the gas borne by the purchaser is only for the gas delivered.

Respondents argue that only the direct cash operating expense should be assigned to these reinjected volumes. This places the burden of the other costs relating to this reinjected gas, DD&A, E&D, and return allowance, on the volumes sold. Under this method the purchaser bears the full burden now of gas that he doesn't receive, but is reinjected for the benefit of the liquids. When and if the reinjected gas is eventually sold, the purchaser bears the full burden a second time. When gas is reinjected it is for the purpose of enhancing future liquid production. The entire cost of producing the gas that serves this function should be borne by the future liquids which are benefited, not by current gas sales. The cost difference for this item between Staff and Respondents is slight in Permian but is considerable in the Continental-United States.

G. SEPARATE COSTING OF APPENDIX B AND C RESPONDENTS

In performing its allocations, Staff handled the Appendix B and Appendix C costs separately. At the final stage, the results of the allocations were combined on a weighted average basis. The final results are substantially the same as if they had originally been combined, as Respondents propose.

H. GASOLINE PLANTS

In Permian raw oil well gas not sold directly to pipelines is, in the main, piped to gasoline plants. There it is compressed and treated, and liquids are extracted.[8]

[8] A small amount of Permian gas well gas is also processed at gasoline plants.

In pipeline cases the Commission has generally held that the gasoline plant operations are jurisdictional, and consequently both the revenues and the costs of these plants should be included in determining the pipeline cost of service. The reasons have been that the liquids extraction operations were deemed useful to the pipeline's operations, and incidental to their over-all transmission operations. In *Phillips* the Commission concluded that the gasoline plant operations of this nonpipeline producer constituted "a business conducted primarily for Phillips' benefit; that their prime purpose is to engage in the maximum extraction which is possible and feasible, for a profit, rather than to render the gas delivered to Phillips' pipeline customers more transportable." The Examiner's discussion on this point, which was adopted by the Commission, relies on the testimony of Phillips' witness.

> The purpose of the processing is the extraction of liquefiable hydrocarbon . . . . The extraction of these liquids from gas is a business of itself. [24 FPC 562, 679, 670 (1960).]

Raw gas is not homogenous. The heavier molecules which constitute the LP gases and natural gasoline can be economically liquefied under certain conditions of pressure and temperature. When liquefied, these hydrocarbons are more valuable than in their gaseous state. In 1960 the average revenue per million Btu's of Permian residue gas was some 11.8 cents, whereas the average revenue per million Btu's of Permian plant liquids was some 45 cents. Thus a Btu of gas that is metamorphosed into a liquid is increased in value some 3.7 times.

Compression of the gas to three stages is performed to facilitate liquid extraction as well as to improve the quality of the gas for pipeline use. There are ten one-stage plants in Permian, not owned or controlled by a pipeline, from which jurisdictional sales of residue gas are made. In nine of these under both the contractual arrangements and the operations of the plants, the one-stage plants deliver low pressure residue gas to the pipeline; the pipeline compresses the gas further, redelivers it to the plant operator for extraction of liquids, and the gas is then redelivered to the pipeline. Compression to three and even four stages is also useful for attaining the higher pressures needed to reinject gas into producing reservoirs. Costs incurred for compression benefit the recovery of liquids and the quality of the gas both for sale to pipelines and for reinjection.

Historically, gasoline plants were operated in Permian to extract liquids from natural gas when the gas was still being flared because there was no market for it. The original purpose of establishing the gasoline plants was solely to convert Btu's of gas into Btu's of liquids because of their enhanced value after their metamorphosis. Since the growth in the demand for the gas and the rise in its price, the operations of the Permian gasoline plants have acquired a second purpose, improving the quality of the residue gas.[8]

Most of the raw gas is sold to the gasoline plants under percentage type contracts pursuant to which the producer is paid a percentage of the revenues realized by the plant from the liquids extracted and from the residue gas sold by the gasoline plant. Thus changes in the price of the residue gas or of the liquids are reflected in the supply price the gasoline plants pay the percentage producer. The percentage contract reduces the risks of the parties from fluctuations in the supply price of the oil well gas and the selling price of the finished products.

---

[8] But note the testimony of Phillips' witness referred to in the *Phillips* case regarding the extraction of liquids: "Actually, it reduces the heating value of the gas, and so might be said to be detrimental to the interests of the pipeline." (*Supra*, at 680, adopted by the Commission at 562.)

Respondent Warren Petroleum Company presented a study of Permian processing costs. Warren's original computations are based on a 16 percent return, but it offered no independent evidence to justify this. It apparently relies on Respondents' other evidence on this point. Respondent witness Morton stated that the return on the plants would be expected to be less than on gas production, that he regarded these operations "as entitled to a return similar to manufacturing companies in general, as a guide." (168/19,849–50.) Dr. Morton's exhibit shows that for the years 1957–61 the average earnings of Fortune's fifty largest and fifty medium size manufacturers were about 9.5 percent. Staff's proposed rate of return is 9.5 percent on gas production including the gasoline plants, based on the weighted average earnings of the publicly listed integrated and nonintegrated petroleum companies. Accordingly, it is concluded that a return of 9.5 percent is reasonable for the gasoline plant operations.

The OPUC and Distributors also use a rate of return of 9.5 percent in their studies. To facilitate comparison, Warren's figures as used herein will be adjusted to reflect a 9.5 percent rate of return.[10]

The consolidated gross revenues of the Permian gasoline plants for 1960 were some $117 million for liquids and $74 million for residue gas sold, which is a split of 61 percent for liquids and 39 percent for the gas. Also the gasoline plants received further revenues of $1.5 million for residue gas returned to the lease, aside from the substantial amounts returned free to the leases, $700 thousand for residue gas delivered under processing agreements, and $2.6 million in miscellaneous revenues for other processing services. Thus for 1960, the total revenues were about $196 million: the revenue from residue gas sales represented some 38 percent, and that from liquids and other sources some 62 percent.

Between 1960 and 1962 the liquid revenue level in Permian fell some 20 percent. On the basis of these prices the revenue split for 1960 is some 57 percent to liquids and 43 percent to residue gas sold.

In filling out the Appendix questionnaires the Respondents functionalized their costs relating to gasoline plants and then assigned or allocated these costs between residue gas and plant liquids. All parties agree that the direct costs of liquid extraction should be assigned to the liquids extracted. The issues here concern the division of the joint costs for gathering, treating and compressing the gas, and also dividing the joint cost of the raw intake gas.

Respondent Warren allocates the joint costs of gathering, treating and compressing on this basis: 87 percent to residue gas sold and 13 percent to the liquids.[11] Warren employs a volumetric method using the vapor volume equivalent of the liquids extracted. Warren's argument is that the size of the pipes and the amount of compression needed are related to the volumes flowing through.

Respondent witnesses Porter and Carney both rely in part on the Armed Services Procurement Regulations (ASPR) as justification for this allocation which Porter quotes:

> Definition of Allocability. A cost is allocable if it is assignable or chargeable to a particular cost objective * * * in accordance with the relative benefits received or other equitable relationship * * * a cost is allocable to a government contract if it * * * benefits both the contract and other work * * * and can be distributed to them in reasonable proportion to the benefits received. * * * Indirect costs shall be accumulated by logical cost groupings with due consideration of the reasons for incurring the costs.

[10] In several of Warren's exhibits a similar adjustment is made for the same reason, but, of course, without prejudice to Warren's claimed return.

[11] Warren agrees that in dealing with plant liquids, the cost of residue gas not sold, but used for other purposes, should not be included in the cost of the gas sold.

> Each grouping should be determined so as to permit distribution of the groupings on the basis of the benefits accruing to the several cost objectives. (158/17,369–71.)

Warren's witness explains:

> For purposes of determining costs and revenue requirements for the regulated portion of the plant operations (i.e., the residue gas sale) it is necessary to divide these joint costs on the basis of cost incurrence or benefits conferred as determined by engineering considerations. (158/17,499–500.)

The phrase "by engineering considerations" in reference to benefits received does not appear in the quoted ASPR regulations.

Warren's witness explains why he disregards the economic purpose of the plants or the relative values of the products which result from the use of the joint facilities:

> The gathering lines and compressors do not know what kind of extraction facilities follow them in the plant, nor are they aware of the competence of the plant owner's marketing department. (225/26,410.)

An extreme example of the application of Carney's vapor volumetric method is this: 99.3 percent of all uranium is nonfissionable U^{238}; some 0.7 percent of uranium is fissionable U^{235}. In the great U-shaped gaseous diffusion plants the two isotopes are separated by converting uranium into a gas and then forcing it through pipes with a series of filters. Eventually the heavier U^{238} collects at the bottom and the lighter U^{235} rises to the top. U^{238} has certain commercial uses; but U^{235} is much more valuable. Under the vapor volumetric method 99.3 percent of the costs would be borne by the U^{238}, and only 0.7 percent by the more valuable U^{235}. For, to paraphrase Warren's witness, the pipes and filters do not know what kind of facilities will follow them, nor are they aware of the purpose of the plant's operations.

Warren's witness' statement that "The gathering lines and compressors do not know what kind of extraction facilities follow them in the plant" would be more in consonance with business reality if, as Distributors point out, he were to add:

> but the processors who invested capital in the plants and designed the systems certainly did know the relation of the various types of facilities to each other, each one as a part of an economic whole. (Reply Brief, p. 45.)

Warren cites Respondent witness Porter's further reference to the ASPR regulations:

> Each cost grouping shall be distributed to the appropriate cost objectives. This necessitates the selection of a distribution base common to all cost objectives to which the grouping is to be allocated. The base should be selected so as to permit allocation of the grouping on the basis of the benefits accruing to the several cost objectives. (158/17,371.)

The question is what are the several cost objectives? The purpose of laying pipes and running compressors in the operation of a gasoline plant is hardly to measure volumes passing through them. The purpose is to add economic value to the products being produced. The purpose is to extract liquids and to facilitate the transportation of some of the gas.

Warren contends that the phrase "benefits received" in the ASPR "is not intended to reflect the monetary value added to each of the products being costed." The quoted regulations do not say how the "benefits received" are to be measured. But it is reasonable to infer that "benefits received" has some relation to the value added to the product by the joint process, and that this factor is expected to be reflected along with cost incurrence. If its meaning is identical with "cost incurrence", as Warren argues, the phrase would not have been needed at all.

The vice in Warren's allocation is that it relies entirely on a physical measurement after an investment has been made. It ignores the economic purpose of the cost incurrence. And in allocating 87 percent of the joint costs to gas and only 13 percent to the more valuable liquids, it is inequitable. For these reasons the volumetric method is rejected.

For the cost of the raw gas supply, Warren uses the average percentage seller's share per Mcf in the residue gas sold in 1960 based on year-end 1960 prices. But the reasonableness of these 1960 year-end prices is in issue in this proceeding. Warren cannot determine the supply cost of its residue gas under the percentage contracts unless the price of its residue gas is first determined. On a cost basis, Warren's final cost for residue gas is therefore indeterminable.

Distributors and CPUC confine themselves to methods of dividing the joint processing costs. They rely on Staff's 1:1 Btu allocation for allocating the gas intake costs. They also adopt Staff's cost of the intake gas. Both the Distributors and the CPUC rely on methods for allocating the joint costs of the gasoline plants which are based on a relationship between the amount of liquids extracted and the joint costs. Distributors' method allocates 36 percent of the joint costs of gathering compressing and treating to the residue gas and 64 percent to the liquids. Distributors' method relies on a correlation for which no causal relation is shown; it also relies on unwarranted and unsound statistical techniques and inferences.

The CPUC method allocates some 20 percent of the joint costs to gas and 80 percent to liquids. The method is based on a grouping of the plants, with the assumption that gas and liquid costs in each of any two groups of plants are equal. But there is no proof of the validity of this assumption and the method is therefore rejected.

Staff accepts the breakdown furnished by the producers in the Appendices regarding the assignment and allocation by the producers of the treatment costs. Staff allocates the joint costs of gathering, compression and intake gas between gas and liquids on a 1:1 Btu basis. On this basis some 72 percent of the joint gathering and compression costs are allocated to gas and some 75 percent of the joint raw gas costs are allocated to gas.

Staff's basic reason for using a 1:1 Btu allocation seems to be that this is what the Commission used in the *Phillips* case. But crucial factors in Permian are different from those in *Phillips*. Phillips was there processing, on the average, lean gas; in Permian the gas is rich in liquids. Thus in *Phillips* the gasoline plants were producing 1.49 gallons of liquids per Mcf of residue gas; in Permian the plants produce 3.44 gallons per Mcf, 2.3 times more. In *Phillips* the residue gas revenues were 1.6 times the liquid revenues; in Permian, the ratio of the gas revenues to the liquid revenues is 0.63. The gas-liquid revenue ratio in *Phillips* was 2.5 times greater than in Permian. In *Phillips* the gasoline plants extracted approximately 1 Btu of liquids for each 7 Btu's of residue gas produced. In Permian the plants produce 1 Btu of liquids for each 3 Btu's of residue gas produced. Thus, as shown on the table on page 405, in Permian the total processed gas-liquid Btu ratio in terms of Btu's is 2.3 times greater than in Phillips.

Staff's method equates a Btu of liquids with a Btu of gas, even though the former has a value 3.7 times the latter at 1960 prices. In using Btu's in its E&D allocation Staff found it necessary to weight the Btu's by economic factors. Every reason for doing so for purposes of that allocation applies with equal force to the allocation of the joint costs of the gasoline plants. Staff's straight Btu method ignores a major economic purpose of the plants—the enhanced value

of the extracted Btu's. The 1:1 ratio method is unsound and unreasonable in the circumstances of this proceeding, and it produces inequitable results.

Btu relationship between residue gas and extracted liquids—Permian Basin *and the* Phillips *case*

Permian Basin:[1]

	MMBtu
(1) Residue Gas Sales	662, 571, 752
(2) Residue Gas Returned to Lease	137, 284, 854
(3) Subtotal	759, 856, 606
(4) Liquids Extracted	249, 426, 738
(5) Total (3)+(4)	1, 009, 283, 344
(6) Btu Ratio—Residue Gas/Liquids $\frac{(3)}{(4)}$	3. 05

Phillips case:

Permian Basin to Phillips:

Residue Gas/Liquids Btu Ratio $\frac{(11)}{(6)}$	2. 3 to 1

[1] Excludes custom processed gas.
[2] Residue gas sold was approximately 95% of total residue gas.
[3] Includes some vented gas.

Source: Distributors' Memorandum in Reply to Examiner's Questions of February 4, 1964—p. 5; Warren-Phillips Memorandum in Reply to Examiner's Questions of February 4, 1964—p. 34.

In the circumstances here the application of an economic factor of at least two for the liquids to modify the Btu's is reasonable. Under such a 2:1 Btu allocation as applied to the processing costs as functionalized by Staff, the joint costs of gathering, compressing and treating are split: 42 percent to residue gas sold, and 58 percent to liquids. The average overall unit cost of processing gas under the 2:1 Btu method is 4.5 cents per Mcf of residue gas processed. The table on page 406 gives the detail.

It is recognized that this method is in considerable part value determined, and that it is in many respects subject to criticisms similar to those that have been leveled at the Staff's value determined allocation for E&D. But burdened with these disadvantages, it is still sounder than any of the methods proposed by the parties.

In determining the payment to the percentage sellers there must be included: their share in the selling price of the residue gas and the liquids as well as the fact that they receive back at the lease some 16 percent of the total residue gas volumes. This gas is returned to be used as fuel on the lease and also to benefit future production of the lease liquids, instead of being sold to the pipeline.

I. CONCLUSIONS REGARDING THE HISTORICAL COST PRESENTATIONS

In the text of this decision it has been concluded that it is only with respect to gas well gas sought for as such, that conclusions regarding the cost of gas are meaningful. The conclusion was also reached that a reasonable cost for old gas well gas could be determined by using the current operating costs and the average historical cost of finding this gas. With regard to oil well gas, the economic cost is extremely low; the gas is an unavoidable by-product of

Adjustment to staff processing costs (Exhibit 173) to reflect allocation of joint costs (gathering, compressing and treating) on a 2:1 Btu basis

	Total	Residue Gas Processed		Liquids	
		Dollars	Percent	Dollars	Percent
Joint expenses	$38,074,716	$21,653,091		$16,421,625	
Joint return	13,894,435	7,458,533		6,435,902

Cost per Mcf, cents		4.50			

Joint costs borne by products sold

		Percent
Residue gas sales	$29,111,624 × 857,405.1 / 786,506.1 = $21,742,127	41.8
Liquids:		
Liquids extracted	22,857,527	
Residue gas not sold	7,369,497	
	30,227,024	58.2
Total joint costs	51,969,151	100.0

the search for and production of oil. It is possible by using various types of allocations of composite total joint costs to arrive at a set of numbers and label them "costs"—or even "equitable costs." But these results have little meaning in the circumstances of this case because they are the end results of a series of allocations piled high on layers of other allocations, each of which involves numerous assumptions, involved calculations, and alternatives where the reasons for preference are often tenuous and the differences in results can be substantial. Nor is it always perceived why the results of these layers of calculations are "equitable." Finally, many of these allocations demand in the name of common sense a value adjustment to a physical factor.

In the case of gasoline plant costs, the problems also revolve about joint costs which serve dual functions, residue gas and liquids extraction. No satisfactory method of dividing these joint costs has been proposed by any party. The Examiner has therefore applied a method which, despite the problems connected with its use, is, in the circumstances of this proceeding, sounder than any presented. However, the most serious problem with costing residue gas is not merely the extreme difficulty of determining a reasonable allocation method for the joint processing costs, but the validity of applying the results of such a method on top of the pile of allocations used to determine the "cost" of the raw gas.

Respondents state in their brief:

> If a historical cost of service computation is deemed necessary as a point of reference for testing producer rates, we submit that such a computation should be limited to the cost of non-associated gas, because it alone may furnish a reasonable approximation of the identifiable cost of gas. The cost of associated gas is wholly dependent upon inherently discretionary allocation methods which render the results of little, if any, meaning for the purpose of measuring revenue requirements. (137:14,370.) Moreover, no data are available for an industry-wide computation of the cost of associated gas, but only for Appendix B and C respondents, which data

understate industry costs. For these reasons we believe that, if it is necessary to make a computation of the cost of all gas, the cost of non-associated gas should be imputed to the cost of associated gas. (182:21, 593.) [Respondents' initial brief, p. 67a.]

The Examiner agrees in the main with this stated cost philosophy of the Respondents. He disagrees on two points. First, it is not clear whether the data for the Appendix Respondents understate industry costs. The Appendix data may not be representative, but whether on balance they overstate or understate industry costs is not definite. For example, on drilling costs per foot the data based on Appendix A Respondents yield results higher than industry costs. See page 377. Again Permian casinghead gas is largely a by-product of Permian oil. While the separate costs of the gas and oil are indeterminable, it is reasonable to conclude that the cost of the gas jointly produced with oil is less than that of gas separately produced, or produced under conditions where it is the major product. Of greater significance, the average value of Permian casinghead gas is so much lower than the average value of Permian gas well gas that, from a value standpoint, the two gases cannot reasonably be priced at the same level. For these reasons the Examiner concluded in the text of this decision that the primary factor in pricing casinghead and residue gas should be their value in relation to the cost of flowing gas well gas. This method is simpler and more reflective of market economics than the multi-allocated cost fictions developed in the historical cost presentations of the parties. Another advantage of this pricing method is the reduction in the expenses and time required for the collection of the needed data and the preparation and presentation of historical "cost" studies.

APPENDIX E

Parties and Proceedings Consolidated

The order of December 23, 1960, made the following parties Respondents:

ORDER ISSUING CERTIFICATES

(Issued August 5, 1965)*

By Opinion No. 468, *supra*, p. 159, and order in this proceeding issued concurrently with this order we have prescribed the just and reasonable rates for

*See order issued October 4, 1965 denying rehearing, etc., 34 FPC 1082.

jurisdictional sales of natural gas in the Permian Basin area. There are four applications for certificates of public convenience and necessity which were consolidated in this proceeding and these are the subject of the present order. Temporary certificates have been granted to all four applicants and the gas is now flowing in interstate commerce.

The only issue presented by the applications is the initial price at which the gas is to be certificated. As we stated in Opinion No. 468, the just and reasonable area rate fixed therein constitutes the "in line" price required by the public convenience and necessity in granting permanent certificates. All of the applications involve "flowing gas" as defined in Opinion No. 468, produced in Texas. The applicable area rate is 14.5 cents per Mcf at 14.65 psia adjusted to reflect any quality deficiencies in the gas and we shall therefore grant the certificates conditioned to an initial price no higher than the applicable area rates. The certificates shall be subject to the moratorium on any rate increase filing in excess of the applicable area rate prior to January 1, 1968, as provided in Opinion No. 468, pp. 227–231.

Each of the certificate applications has a somewhat different history from the others and also differs in its contract provisions. We shall therefore discuss each of them separately.

The proposed rate schedule of *North Central Oil Company (Operator), et al.*, Docket No. CI60–435, contains provisions specifying that the gas must equal or exceed in every particular the pipeline quality standards established in Opinion No. 468. A permanent certificate will therefore be issued in this docket providing for an initial price of 14.5 cents per Mcf at 14.65 psia. The temporary certificate contained no refund condition but a rate increase was filed during the period of the temporary. The increased rate was suspended pursuant to Section 4(e) and has subsequently been collected subject to refund, Docket No. RI65–288. The last-mentioned docket has not been consolidated herein and accordingly the question of refunds in that proceeding will be disposed of pursuant to the Order to Show Cause issued this date, *infra*, p. 424. The question of whether refunds should be ordered during the period of the temporary when no express refund obligation was operative, but prior to the effective date of the proposed increased rate, will be deferred until our decision of the same issue in Skelly[1] and Amerada[2].

Robert T. Brown (Operator), et al., Docket No. CI61–733 involves sales made under a temporary certificate without an express refund condition. The related contract contains provisions requiring gas moving under it to equal or exceed pipeline quality standards in all respects save for hydrogen sulphide and total sulphur. The permanent certificate will provide for an initial price computed by modifying the ceiling price of 14.5 cents per Mcf by deducting therefrom the cost of processing the gas to meet the pipeline quality standards for the Permian Basin. Accordingly the producer (unless these sales qualify as small producer sales as defined in the rule proposed this date providing for small producer certificates for such sales) shall, within 90 days of the effective date of this order, file a statement which shall state either that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards, the agreed cost to the buyer of processing the gas to bring it to the quality standards with respect to each quality defect, and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller

[1] Skelly Oil Company, Docket No. G–18638, *et al.*
[2] Amerada Petroleum Corporation, *et al.*, Docket No. CI62–1544, *et al.*

must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period. In such event the Commission will then determine the amount of the quality deduction. As in the case of *North Central Oil Corporation (Operator), et al., supra*, the determination of any refunds which may be due for the period of the temporary, when no express refund conditions were in effect, shall be deferred.

The applications of *Socony Mobil Oil Company, Inc.* (Socony), Docket No. CI61–34, and *Texaco Inc.*, Docket No. CI61–879, involves so-called Spraberry or El Paso contracts. In accordance with the principles established in Opinion No. 468, the applicable area rate will be applied to the volumes of residue gas taken into the purchaser's pipeline under these contracts. The contracts provide that there shall be a reduction in the price paid for such residue gas if treatment of the casinghead stream received by the buyer is necessary to remove sulphur. The cost of such treatment and the cost of any other necessary treatment of the casinghead stream to bring the gas to pipeline quality, aside from those processing costs incurred in removing the liquids, must be deducted from the ceiling price of 14.5 cents per Mcf to determine the applicable area rate. The certificates granted in these two dockets will be conditioned upon a filing by the producer within 90 days of the effective date of this order of a statement as to quality of the casinghead gas and cost of treating (or an estimate if no agreement is reached) as described above and further conditioned upon an initial price equal to the applicable rate established by deduction from 14.5 cents per Mcf of the cost of treating the gas to pipeline quality standards as such cost is determined by agreement of the parties or by the Commission. During the time they were operating under these temporary certificates both Socony and Texaco Inc. filed for rate increases which were suspended and are now in effect subject to refund. Computations of the refunds due for the period during which these rates have been collected subject to refund will be dealt with in the Section 4(e) proceeding. Docket Nos. RI65–209 and RI65–115.

Socony succeeded to a temporary certificate which contained a refund condition. Texaco Inc. succeeded to a temporary certificate without refund condition. Accordingly, Socony will be required to submit a computation of all excess amounts collected for the entire period of operations under the temporary certificate except the time during which the Section 4(e) proceeding was pending, and to make refund of those amounts with interest. For the reasons previously stated, Texaco Inc. will not be required at this time to make any refunds for the period when there was no express refund condition.

All certificates issued herein shall be subject to a moratorium against rate increases prior to January 1, 1968, unless such increases are authorized by later order of the Commission.

The Commission finds:

(1) Each applicant for a certificate of public convenience and necessity listed in Appendix A hereto is a "natural-gas company" within the meaning of the Natural Gas Act as an independent producer of natural gas, as that term is defined in Section 154.91(a) of the Commission's Regulations, engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption and such sales together with the construction and operation of any facilities therefor are subject to the requirements of subsections (c) and (e) of Section 7 of the Natural Gas Act.

(2) Each applicant listed in Appendix A hereto is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(3) The sale of natural gas as proposed herein by each applicant listed in Appendix A hereto together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor are required by the public convenience and necessity and a certificate authorizing the same should issue to each of them upon the terms and conditions of the order herein, which terms and conditions are required by the public convenience and necessity.

(4) Except as granted in the order in Opinion No. 468 the exceptions of the applicants listed in Appendix A hereto to the presiding examiner's initial decision and proposed order should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are issued, upon the terms and conditions of this order, authorizing the sales by the applicants listed in Appendix A to this opinion of natural gas in interstate commerce for resale, together with the construction and operation of any facilities subject to the jurisdiction of the Commission necessary for such sales, all as hereinbefore described and as more fully described in the respective applications, amendments, supplements and exhibits in this proceeding.

(B) The certificates granted in paragraph (A) above are not transferable and shall be effective only so long as the applicants continue the acts or operations hereby authorized in accordance with the provisions of the Natural Gas Act and the applicable rules, regulations and orders of the Commission.

(C) The grant of the certificates issued in paragraph (A) above shall not be construed as a waiver of the requirements of Section 4 of the Natural Gas Act or Part 154 or Part 157 of the Commission's Regulations thereunder, and is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the respective applicants. Further, our action in this proceeding shall not foreclose or prejudice any future proceedings or objections relating to the operation of any price or related provisions in the gas purchase contracts herein involved. The grant of the certificates aforesaid for service to the particular customers involved shall not imply approval of all the terms of the respective contracts, particularly as to the cessation of service upon termination of said contracts, as provided by Section 7(b) of the Natural Gas Act. The grant of the certificates aforesaid shall not be construed to preclude the imposition of any sanctions pursuant to the provisions of the Natural Gas Act for the unauthorized commencement of any sales of natural gas subject to said certificates.

(D) The notice provisions of Section 154.94(b) and the detailed submittal subprovisions of Section 154.94(f) of the Commission's Regulations under the Natural Gas Act are waived insofar as they apply to any reductions in rates hereby ordered.

(E) The certificate granted to North Central Oil Corporation (Operator), *et al.*, is conditioned upon a total initial price, including tax reimbursement, of 14.5 cents per Mcf at 14.65 psia, and within 30 days of the effective date of this order North Central shall file a supplement to its presently filed rate schedule reflecting the conditioned price as the initial price in lieu of the initial price provided in the present rate schedule.

(F) The certificates granted to the applicants, other than North Central Oil Corporation (Operator), *et al.*, are hereby conditioned to a total initial price,

including tax reimbursement, no greater than the applicable base area rate of 14.5 cents per Mcf at 14.65 psia subject to further reductions, effective as of the effective date of this order, for any quality deviations as determined pursuant to ordering paragraph (G) hereof, and further conditioned upon the filing by the respective applicants within 30 days of the determination of such rate of a supplement to its filed rate schedule reflecting the applicable area rate in lieu of any rate provided in the rate schedule then on file, and further conditioned upon refunds being made with interest by each applicant of the difference between the applicable area rate and any rate in excess thereof collected subsequent to the effective date of this order. The manner and time of such refunds shall be determined by the Commission in a later order.

(G) The certificate hereby granted to each applicant listed in Appendix A hereto, other than North Central Oil Corporation (Operator) *et al.*, is issued upon the condition that such applicant (unless the sale qualifies as a small producer sale pursuant to the proposed rule issued this date) shall file, within 90 days of the effective date of this order, a statement that the gas accords with all pipeline quality standards established in Opinion No. 468 or in which respects the gas deviates from such standards, the agreed cost to the buyer of processing the gas to bring it to the quality standards with respect to each quality defect and the resulting rate for the gas. Such statement shall be signed by both seller and buyer. However, if the seller and buyer are unable to agree upon any or all of the particulars entering into the computation of the proper price, the seller must so indicate in the statement and supply the information required to compute the applicable area rate as adjusted as well as the contentions of the parties with respect to the quality and amount of the adjustment as any item in dispute. The buyer may file a separate statement setting forth its views within such period.

(H) The certificate granted to Socony Mobil Oil Company, Inc., is issued upon the condition that the said applicant shall file within 120 days of the effective date of this order a report in triplicate with this Commission of the refunds due each buyer by reason of the collection by said applicant and its predecessor of rates in excess of the applicable area rate during the period in which such excess rates were collected prior to the effective date of the rate which is the subject of the present proceeding in Docket No. RI65-209.

(I) Socony Mobil Oil Company, Inc. shall retain the amounts shown in the report required under (H) above, subject to further order of the Commission directing the disposition of those amounts. If said applicant elects to commingle these retained refunds with its general assets and use them for its corporate purposes, it shall pay interest thereon at the rate of 4.5 percent per annum on all funds thus available from the date of the filing of the refund report to the date on which they are paid over to the person ultimately determined to be entitled thereto in a final order of the Commission. If the applicant elects to deposit the retained refunds in a special escrow account, the respondent shall tender for filing on or before the date of the filing of the refund report an executed Escrow Agreement, conditioned as set out below accompanied by certificate showing service of a copy thereof upon each of its jurisdictional customers. Unless notified to the contrary by the Secretary within 30 days from the date of filing thereof, the Escrow Agreement shall be deemed to be satisfactory and to have been accepted for filing. The Escrow Agreement shall be entered into between respondent and any bank or trust company used as a depositor for funds of the United States Government and the agreement shall be conditioned as follows:

(1) Respondent, the bank or trust company, and the successors and assigns of each, shall be held and formally bound unto the Federal Power Commission for

the use and benefit of those entitled thereto, with respect to all amounts and the interest thereon deposited in a special escrow account, subject to such Agreement, and such bank or trust company shall be bound to pay over to such person or persons as may be identified and designated by final order of the Commission and in such manner as may be therein specified, all of any portion of such deposits and the interest thereon.

(2) The bank or trust company may invest and reinvest such deposits in any short-term indebtedness of the United States or an agency thereof or in any form of obligation guaranteed by the United States which is, respectively, payable within 120 days as the said bank or trust company in the exercise of its sound discretion may select.

(3) Such bank or trust company shall be liable only for such interest as the invested funds described in Paragraph (2) above will earn and no other interest may be collected from it.

(4) Such bank or trust company shall be entitled to such compensation as is fair, reasonable and customary for its services as such, which compensation shall be paid out of the escrow account to such bank or trust company. Said bank or trust company shall likewise be entitled to reimbursement for its reasonable expenses necessarily incurred in the administration of this escrow account, which reimbursement shall be made out of the escrow account.

(5) Such bank or trust company shall report to the Secretary of this Commission quarterly, certifying the amount deposited in the trust account for the quarterly period.

(J) The decision whether refunds should be ordered as a condition of the permanent certificate of applicants, other than Socony Mobil Oil Company, Inc., listed in Appendix A hereto is deferred for subsequent determination. Such certificates shall issue at the present time subject to the condition that the subsequent determination of the Commission with respect to such refunds shall then be incorporated in each such certificate as a condition thereof.

(K) The certificate granted to each applicant listed in Appendix A hereto is issued upon the condition that the applicant shall not file any change in rate providing for a price in excess of the applicable area rate prior to (1) subsequent order of the Commission in this proceeding permitting such filing or (2) January 1, 1968, whichever is earlier.

(L) The certificate of each applicant listed in Appendix A is issued upon the condition that the proposed rate schedule of the applicant shall be amended by the inclusion of the following language:

> From the effective date of the order of the Federal Power Commission in the Permian Basin Area Rate Proceeding AR61–1, until January 1, 1968, no increase in rates may be filed, except in compliance with a specific order of the Commission, at a rate in excess of the applicable area rate as determined pursuant to said proceeding or pursuant to later order of the Commission. Applicable area rate, as that term is used herein, shall mean the rate to be determined after all adjustments from the ceiling price because of deviations from the pipeline quality standards established in the aforesaid order of the Commission.

(M) Except as herein granted the exceptions to the initial decision and proposed order are hereby denied.

AREA RATE PROCEEDING (PERMIAN BASIN), DOCKET NO. AR61-1, ET AL.

ORDER TO SHOW CAUSE

(Issued August 5, 1965)*

By Opinion No. 468 and order issued in the above proceeding concurrently with this order, *supra*, p. 159, we have prescribed just and reasonable rates for all jurisdictional sales of natural gas made in the Permian Basin area by respondents therein and ordered refunds in the Section 4(e) proceedings consolidated therewith. We know of no reason why the record already made in this proceeding is not adequate to determine the rates of non-respondents presently certificated under permanent or temporary authorization to sell gas in the Permian Basin and also to determine the refund obligations under unconsolidated 4(e) dockets of respondents or non-respondents. We believe the record is also sufficient to conclude that any outstanding certificate applications not consolidated in the case for new sales in the area should be certificated at or below the applicable ceiling price as the sales contract may permit.

We therefore are of the opinion that the determinations set forth in Opinion No. 468 should apply to these other sales of gas and to certificate applications in the Permian Basin which were not consolidated in the Permian case. Nevertheless, we shall afford the producers making these sales or seeking certificates an opportunity to show cause why the rate determinations made in Opinion No. 468 and accompanying order should not be applicable to their sales from the Permian Basin as defined in our order instituting this proceeding.

In view of the foregoing, it is necessary and appropriate for the purpose of administering the Natural Gas Act that the parties listed in Appendixes "A"[1] and "B"[2] and "C"[3] be made respondents to this proceeding (to the extent that they are not already respondents) and be required to show cause, if there be any, why the rates determined in Opinion No. 468 and accompanying order should not be made applicable to all Permian Basin sales of the respondents in Appendixes "A" and "B", and should not determine the refund obligations under the dockets listed in Appendix "C".

While just and reasonable rates were prescribed prospectively in the Permian decision for sales made pursuant to temporary authorization by those producers listed in Appendix "D",[4] permanent authorization has not been granted to those producers for such sales. We shall therefore also make such producers respondents herein, and shall give them an opportunity to show cause why they should not receive permanent certificates at the rate level prescribed in Permian. We

---

*Reconsideration denied by order issued October 12, 1965, 34 FPC 1135.

[1] Appendix A includes all persons making sales in the Permian Basin under permanent certificates who were not made respondents under previous orders in Docket No. AR61-1.

[2] Appendix B includes all pending certificate applications of parties who were not made respondents in previous Permian orders whether their sales were being made under temporary certificates or not, together with all pending certificate applications of parties previously made respondents in Permian where no sales are being made under temporary authorization.

[3] Appendix C includes all pending Section 4(e) dockets not previously consolidated in the Permian proceeding.

[4] Appendix D includes all pending certificate applications of parties previously made respondents in Permian who are making sales under temporary authorizations but have not been afforded a hearing under Section 7 of the Natural Gas Act.

shall also give those producers in Appendix "B"[5] who have not received permanent authorization a similar opportunity.

The Commission orders:

(A) The parties listed in Appendixes "A", "B" and "C" hereto are made respondents herein and shall show cause, in writing, if there be any, within 90 days of the issuance of this order, why the rates prescribed by Opinion No. 468 and accompanying order shall not be applicable to all Permian Basin sales of the respondent listed in Appendixes "A" and "B" and to all the refund obligations under the dockets listed in Appendix "C".

(B) The parties listed in Appendix "D" shall show cause, in writing, if there be any, within 90 days of the issuance of this order, why they should not receive permanent certificate authorization for their respective sales at the rates prescribed by Opinion No. 468 and accompanying order.

(C) The parties listed in Appendix "B" which have not received permanent certificate authorization for their sales shall also show cause, in writing, if there be any, within 90 days of the issuance of this order, why they should not receive permanent certificate authorization for their respective sales at the rates prescribed by Opinion No. 468 and accompanying order.

(D) Future procedures shall be established by subsequent orders of the Commission herein.

RATE AND CERTIFICATE FILINGS BY SMALL INDEPENDENT PRODUCERS, DOCKET NO. R–279

NOTICE OF PROPOSED RULEMAKING: MISCELLANEOUS AMENDMENTS TO THE REGULATIONS UNDER THE NATURAL GAS ACT

(August 5, 1965)*

1. Pursuant to the Commission's decision in Docket No. AR61–1 (issued this day, hereinafter referred to as the "Permian Decision") and in particular the provisions thereof relating to certain relief from filing requirements for "small producer sales," and for the purpose of implementing certain findings, determinations and conclusions in that decision, notice is hereby given of proposed amendments and additions to the appropriate regulations under the Natural Gas Act.

2. The Commission noted in the Permian Decision that present filing requirements contained in the Regulations often constitute a burden for the small independent producer. In order that the Commission may be informed as to these transactions, it is proposed that certain data be included in the annual reports to the Commission of the pipeline companies which purchase gas from such producers. The changes in the Regulations herein proposed will, if adopted, relieve the small producer in the Permian Basin from applying for individual certificates for new sales of gas at prices within the ceiling price for the area and from filing for rate increases which do not exceed the applicable ceiling. It is contemplated that sales by small producers in the remaining areas will be covered by these new rules when just and reasonable area rates are fixed for the respective areas.

3. In accordance with the notice requirements of Section 4 of the Administrative Procedure Act, general notice of the proposed amendments to the regulations will be published in the Federal Register. All interested persons, whether or not they are parties in Docket No. AR61–1, may submit to the Federal Power Commission on or before September 7, 1965, data, suggestions and comments in writing concerning the proposed amendments. The Commission will consider these written submissions before taking any action upon the proposed amendments. An original and nine copies of any such submissions should be filed.

*Published in the Federal Register on August 12, 1965 (30 F.R. 10058).

4. Subject to such changes as may be made upon consideration of the submissions of interested persons, the Commission finds that the proposed amendments to the Regulations are necessary and appropriate for the proper administration of the Natural Gas Act.

The Commission proposes that the following amendments be adopted pursuant to Sections 4, 7 and 16 of the Natural Gas Act.

(A) Parts 154 and 157 of Subchapter E and Part 260 of Subchapter G, Chapter I, Title 18, Code of Federal Regulations should be amended by amending §§ 154.103, 157.31, 260.1 and 260.2, and by adding new §§ 154.104, 154.110, and 157.40 as follows:

1. Section 154.103 would be redesignated as 154.110 and amended to read as follows:

§ 154.110 Applicability of §§ 154.92 through 154.102.

Sections 154.92 through 154.102 shall apply only to those persons specified in § 154.91 but shall not apply to producers who are subject to § 157.40 of this chapter.

2. Section 154.104 would be added to Part 154 and read as follows:

§ 154.104 Producers Subject to § 157.40.

Those producers who, due to their coverage by § 157.40, have been relieved in § 154.110 from the filing obligations imposed by this Part, shall file the required information in the annual statements filed pursuant to § 157.40.

3. Section 157.31 redesignated as § 157.39 and would be amended to read as follows:

§ 157.39 Applicability of §§ 157.23 through 157.30.

Sections 157.23 through 157.30 shall be applicable to independent producers as defined in § 154.91 of this Chapter, with the exception of those independent producers who are subject to § 157.40.

4. Section 157.40 would be added to Part 157 and read as follows:

§ 157.40 Small Producer Certificates of Public Convenience and Necessity.

(a) *Definitions*

(1) A "Small Producer" is an independent producer of natural gas as defined in § 154.91 of this Chapter, whose total jurisdictional sales on a nation-wide basis, together with such sales of "affiliated producers," are not in excess of 10,000,000 Mcf per year. As used in this section, the term "jurisdictional sales" includes volumes of gas paid for but not taken under prepayment clauses or otherwise, and volumes of gas sold under other independent producer rate schedules in the proportion that the independent producer seeking to come within this section has an interest in such sales, but does not include sales made pursuant to percentage sales contracts.

(2) "Affiliated producers" are persons who, directly or indirectly, control, or are controlled by, or are under common control with, the reporting producer. Such control exists if the producer has the power to direct or cause the direction of the management and policies of a person, whether such power is exercised alone or through one or more intermediary companies, or pursuant to an agreement, and whether such power is established through a majority or minority ownership or voting of securities, common directors, officers, or stockholders, voting trusts, holding trust, associated companies, or any other direct or indirect means. For the purposes of this section, independent producers who are, or are controlled by, members of the same family, whether related by blood or marriage, are presumed to be "affiliated."

Such presumption is rebuttable upon a satisfactory showing to the Commission that the producing companies are in fact operating independently.

(3) "Small Producer Sales" are sales by small producers (as defined herein) in which one or more producers have an interest, but do not includes sales in which one or more producers not qualifying as small producers have interests which in the aggregate are greater than 12½ percent.

(b) *Requirements for the Small Producer Certificate*

Upon the approval of appropriate applications made pursuant to the provisions of this section, Small Producers will be granted "Small Producer Certificates" authorizing "small producer sales" of natural gas in interstate commerce at prices no higher than the applicable just and reasonable area ceiling for such gas, without further certification from the Commission.

(1) Small Producer Certificates are initially available only to Small Producers operating in the Permian Basin and are applicable only to their small producer sales in that area. Such certificates will apply to production in other areas and the producers therein located upon the fixing of just and reasonable rates for such areas by the Commission.

(2) Small Producers in the Permian Basin may apply for a Small Producer Certificate to cover all previous and all future jurisdictional sales, which do not raise the producer's total jurisdictional sales on a nation-wide basis above 10,000,000 Mcf per year. Applications by these producers shall include the following information: (i) total jurisdictional sales on a nation-wide basis for the year preceding the application; (ii) a list of outstanding certificates and rate schedules together with names and percentage of interest of other interest owners under such rate schedules; and (iii) the names of all owners (stockholders, partners, joint venturers, etc.) of the applicant with an interest of 5 percent or more, their percentage of ownership in the applicant and in any other natural gas company, and any positions such owners may hold with another natural gas company.

(3) Applicants for Small Producer Certificates who have no outstanding certificates issued by this Commission for the sale of gas shall include the following information in their applications: (i) a listing of all contracts to sell natural gas in interstate commerce; at least one contract (either executed or in process of negotiation) must be listed in order that the application may be considered; (ii) source of production, total rate and the annual volume delivery obligations of the producer under each such contract, together with names and percentage of interest of other interest owners under each such contract, and (iii) a list of all owners of the applicant, their percentage of ownership in the applicant and in any other natural gas company and any position such owners may hold with another natural gas company.

(4) The application as filed shall contain the information called for on Form A* attached hereto.

(c) *Annual Statements*

Annual statements (Form B* attached hereto) shall be filed by all producers, either individually or by groups, to whom Small Producer Certificates have been issued. The statements shall be submitted not later than February 15 of each year for the preceding calendar year.

(d) *Duration of the Small Producer Certificate*

A Small Producer Certificate issued hereunder shall remain in effect for small producer sales until the Commission on its own motion or on application terminates such certificate because the producer no longer qualifies as

*Omitted in printing.

a small producer or for other good cause. Upon such termination the producer will be required to file separate certificate applications and individual rate schedules for future sales but the Small Producer Certificate will still be effective as to those past sales already certificated thereunder.

5. Sections 260.1 and 260.2 dealing with annual reports for natural gas companies would be amended by the addition of the following paragraph to each of those sections.

(d) All natural gas companies, as defined in the Natural Gas Act, purchasing gas from independent producers who have been granted Small Producer Certificates pursuant to § 157.40, shall include the following information pertaining to such purchases in their annual report: (i) the name of the producer and the field from which the gas is produced; (ii) the average rate paid per Mcf; (iii) the amount of gas received under each contract with the producer, and (iv) the amount paid for the gas received under each contract.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. RP61-8

ORDER REJECTING AND DENYING APPLICATION FOR REHEARING

(Issued August 6, 1965)

On July 9, 1965, Natural Gas Pipeline Company of America filed an application for rehearing of our Opinion No. 456-A and order issued June 23, 1965, 33 FPC 1277, on rehearing in the above-entitled proceeding. On July 23, 1965, the City of Chicago also filed an application for rehearing of Opinion No. 456-A and order, and also a petition for the issuance of a declaratory order as to whether or not Natural's application for rehearing will be accepted and "thereby extend the time for filing an appeal". Chicago points out that no provision is made in our Rules for review of orders issued on rehearing, and requests that a declaratory order be entered rejecting all applications for rehearing on orders issued on rehearing.

This opinion was issued after we had granted rehearing with respect to our original Opinion No. 456, 33 FPC 574, for the purpose of further consideration. In Opinion No. 456-A we confirmed with certain modifications Opinion No. 456, where we determined that Natural must "flow through" to its customers the advantages of liberalized depreciation and make refunds from February 3, 1964. Because Natural announced that it was proposing to change to straight-line depreciation on its tax returns as of January 1, 1965, and argued that it had nothing to "flow through" to its customers after that date, a further determination was necessary. It was our opinion as expressed in Opinion No. 456-A that Natural could not reopen the record in this way, but its proper course was to start a new proceeding by making a rate filing. Therefore, we said, the reduced "flow-through" rates should remain in effect until superseding rates filed by Natural became effective.

In their present applications for rehearing Natural and Chicago reargue a number of matters that were in issue when we issued our original Opinion No. 456 and order. These include the applicability of *Alabama-Tennessee Natural Gas Co.*, 31 FPC 208, and the date from which refunds should be computed. Since there is no provision in the Natural Gas Act or our Rules for a second application for rehearing, with respect to these matters the applications should be rejected, and to this extent the request in Chicago's petition for a

declaratory order will be granted. However, on our treatment of its abandonment of liberalized depreciation for tax purposes Natural, in our opinion, could properly file an application for rehearing, since this was a new matter raised by Natural and determined by us in the first instance in Opinion No. 456–A and order. Otherwise there would be no opportunity for applying for rehearing with respect to this matter. To this extent, therefore, we accept Natural's application for rehearing and deny the request in Chicago's petition for a declaratory order.

In its application for rehearing Natural argues that to require it to file a new rate case to give effect to the factor of abandonment is inconsistent with *Midwestern Gas Transmission Company*, 32 FPC 993, Opinion No. 444, Docket Nos. RP61–19 and RP62–7, issued October 13, 1964. In that proceeding, which was a rate investigation under Section 5(a) of the Natural Gas Act, the company likewise changed from liberalized to straight-line depreciation for tax purposes after the close of the record, although unlike the present case it did so before, rather than after, an adverse Commission decision on the point. Because an immediate reduction in the company's rates was justified and required by our disposition of other issues, we ordered the company to file new rates based upon straight-line depreciation. These rates were made subject to further reduction to reflect the use of liberalized depreciation in the tax allowance should the Commission finally determine in the remanded proceeding it set for hearing that the liberalized method should be used.

As we said in Opinion No. 456–A the significant difference here is that the *Midwestern* case was a Section 5(a) investigation designed to change rates prospectively. Looking only to the future in *Midwestern* our alternatives were to remand the entire case for further hearing to reflect the new circumstances, thus foregoing an immediate rate reduction which appeared to be warranted whether Midwestern took liberalized depreciation or not, or to divide the case as we chose to do. On the other hand this proceeding was initiated under Section 4 with a rate increase filing by Natural and relates to the period from March 1, 1961, until new rates became effective. It is our opinion as stated in Opinion No. 456–A that Natural should not be permitted to reopen the record applicable to this period and change one factor to its advantage without bringing other factors up to date. In order to terminate the effect of the present proceeding and bring this new factor before us, Natural could lock in the refund period now running by a further rate filing under Section 4 reflecting its changed method of computing depreciation for tax purposes and any other relevant matters relating to its cost of service or rates.

The Commission further finds:

(1) Chicago's application for rehearing and the portions of Natural's application for rehearing referred to below should be rejected.

(2) The assignments of error and grounds for rehearing set forth in Natural's application for rehearing filed in the proceeding present no facts or legal principles which would warrant any change or modification in the Commission's Opinion No. 456–A and order.

(3) The request contained in Chicago's petition for a declaratory order should be granted in part and denied in part as specified below.

The Commission orders:

(A) Chicago's application for rehearing and the portions of Natural's application for rehearing filed July 9, 1965, other than those relating to Natural's proposed abandonment of liberalized depreciation for tax purposes, are rejected.

(B) To the extent not rejected Natural's application for rehearing filed July 9, 1965, is denied.

(C) The request contained in Chicago's petition for a declaratory order that Natural's application for rehearing be rejected is denied with respect to the issue relating to abandonment of liberalized depreciation for tax purposes, but is granted with respect to the other issues.

Commissioner Bagge *not participating.*

SOUTHWESTERN OIL & REFINING COMPANY (OPERATOR), ET AL., DOCKET NOS. G-3881, G-19933, G-19997, RI60-285 AND CI65-1260

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT OF SERVICE, AMENDING ORDER ISSUING CERTIFICATE, ACCEPTING SUPPLEMENT AND OFFER OF SETTLEMENT, SEVERING AND TERMINATING PROCEEDINGS, AND ORDERING REFUNDS

(Issued August 6, 1965)

On June 2, 1965, Southwestern Oil & Refining Company (Operator), *et al.*, (Southwestern) filed an application for abandonment for the sales of natural gas made under its Rate Schedule No. 3, and for settlement of its proposed increased rates under said rate schedule and also under its Rate Schedule No. 5, pursuant to Section 1.18 of the Commission's Rules of Practice and Procedure. The above-docketed proceedings involve sales of natural gas made by Southwestern to Tennessee Gas Transmission Company (TGT) from fields in Texas Railroad Commission District No. 4. The proposed rate increases under Southwestern's Rate Schedule No. 3 were, in Docket No. G-19997, from 11.90337¢ to 14.87597¢ per Mcf of gas, and in Docket No. RI60-285 to 17.02416¢ per Mcf. Under its Rate Schedule No. 5, Southwestern proposed rate increases from 12.12268¢ to 15.0952¢ per Mcf in Docket No. G-19933, and to 17.24347¢ per Mcf in Docket No. RI60-285.[1]

Each of the proposed increased rates were suspended for the statutory period by order of the Commission, and were subsequently placed in effect, subject to refund by Southwestern by motion duly filed in accordance with the applicable provisions of the Natural Gas Act.

Southwestern proposes a settlement rate under each of the subject rate schedules of 14.6¢ per Mcf at 14.65 psia. Its proposal includes the elimination of the price redetermination and favored nation clauses from its FPC Gas Rate Schedule No. 5, and the substitution therefor of 1.0¢ per Mcf periodic escalations to commence on July 1, 1965, February 5, 1968, and each five-year period thereafter. Southwestern also proposes to refund to TGT all monies collected subject to refund above the settlement rates.

However, in its application for abandonment of sales of natural gas under its FPC Gas Rate Schedule No. 3, Southwestern states that the reserves are depleted, and TGT, by letter agreement dated November 6, 1964, concurs. As we have previously stated, the provisions of the Second Amendment to the Statement of General Policy No. 61-1 (18 CFR 2.56) are not applicable where deliveries of natural gas have ceased, *Jack P. Rayzor (Operator), et al.*, Docket No. G-16702 (order issued June 20, 1963); *Reserve Oil and Gas Company*, Docket No. G-18570, *et al.*, 33 FPC 1266 (order issued June 16, 1965). Consequently, we shall condition our approval of Southwestern's offer of settlement to require it to refund

[1] All of the rates stated are at 14.65 psia, inclusive of tax reimbursement.

to TGT all amounts collected subject to refund above the area increased ceiling rate which is 14.0¢ per Mcf at 14.65 psia for the sale of pipeline quality gas less applicable contract deductions.[2]

Under the settlement proposal, as conditioned herein, Southwestern's annual revenues will be decreased approximately $29,078 from its presently effective rate, and it will refund to TGT approximately $131,594, exclusive of interest.

The sale made by Southwestern to TGT under its FPC Gas Rate Schedule No. 3, for which it seeks abandonment, and cancellation of said rate schedule, was certificated in Docket No. G–3881. After due notice of Southwestern's application no petition to intervene, notice of intervention, or protest to the granting of the application have been filed.

At a hearing held on July 1, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application submitted in support of the authorization sought herein.

We desire to make it clear that our conditional acceptance of Southwestern's offer of settlement shall not be construed as approval of any future increased rate filed in accordance with its reservation of the right to file increases to cover future tax increases or periodic increases as provided for in its offer of settlement, and is without prejudice to any findings or order of the Commission in any future proceedings, involving Southwestern's rates and rate schedules.

The Commission finds:

(1) Applicant is engaged in the sale of natural gas in interstate commerce for resale for ultimate public consumption subject to the jurisdiction of the Commission and is, therefore, a "natural-gas company" within the meaning of the Natural Gas Act.

(2) The sale of natural gas proposed to be abandoned, as hereinbefore described and as more fully described in the application in this proceeding, is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The subject abandonment is permitted by the public convenience and necessity and should be approved as hereinafter ordered.

(4) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the order issuing a certificate in Docket No. G–3881 should be amended by deleting therefrom authorization to make the sale proposed to be abandoned.

(5) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act that notice of cancellation of Applicant's FPC Gas Rate Schedule No. 3 should be accepted for filing.

(6) The proposed settlement of the above designated proceedings, as conditioned herein and on the basis described herein, as more fully set forth in the offer of settlement filed with the Commission by Southwestern on June 2, 1965, is consistent with the Statement of General Policy No. 61–1, as amended, 18 CFR 2.56, and the conditional approval thereof as made effective and hereinafter ordered is in the public interest and is appropriate to carry out the provisions of the Natural Gas Act.

The Commission orders:

(A) Permission for and approval of the abandonment of service by Applicant, as hereinbefore described and as more fully described in the application in Docket No. CI65–1260, are granted.

[2] Southwestern's FPC Gas Rate Schedule No. 3 provides for a 0.21931¢ per Mcf dehydration charge, therefore, it will actually refund to a rate of 13.78069¢ per Mcf for the monies collected subject to refund.

(B) The order issuing a certificate in Docket No. G–3881 is amended by deleting therefrom authorization to make the sale of natural gas permitted to be abandoned in paragraph (A) above.

(C) The Notice of Cancellation dated November 30, 1964, is accepted for filing effective the date of this order and is designated as Supplement No. 4 to Applicant's FPC Gas Rate Schedule No. 3.

(D) The offer of settlement filed with the Commission by Southwestern on June 2, 1965, is approved as conditioned herein and in accordance with the provisions of this order.

(E) Southwestern shall file within 30 days of the issuance of this order a notice of change in rate providing for the settlement rate of 14.6¢ per Mcf at 14.65 psia, inclusive of tax reimbursement under its Rate Schedule No. 5 together with an executed contract amendment eliminating the favored-nation and price redetermination clauses from said Rate Schedule. The notice of change and the contractual amendment shall be submitted in accordance with Part 154 of the Commission's Regulations under the Natural Gas Act.

(F) Southwestern shall compute the difference between the rates collected subject to refund and 13.78069¢ and 14.6¢ per Mcf under Rate Schedule Nos. 3 and 5, respectively, with applicable interest, to the date of this order, and shall within 45 days from the date of issuance of this order submit a report to the Commission, with a copy to TGT, setting out the amount of refunds (showing separately the principal and applicable interest), the bases used for such determination, the periods covered, and ten days thereafter a letter from TGT agreeing to the correctness of such amounts. Ten days thereafter, unless notified to the contrary by the Secretary of the Commission, Southwestern shall refund to TGT the monies, with applicable interest, computed as set forth above.

(G) Upon notification by the Secretary of the Commission that Southwestern has complied with the terms and conditions of this order, the rate and charge of 14.6¢ per Mcf under its Rate Schedule No. 5, specified in its offer of settlement shall be effective as of the date of the issuance of this order; the above-designated proceedings shall be deemed severed from the Texas Gulf Coast proceeding, Docket No. AR64–2, and the proceeding in Docket No. G–3881 shall be deemed terminated insofar as it pertains to Southwestern's FPC Gas Rate Schedule No. 3.

(H) The acceptance by the Commission of Southwestern's offer of settlement, as herein conditioned, is without prejudice to any findings or determinations that may be made in any proceeding now pending, or hereafter instituted by or against Southwestern, and is without prejudice to claims or contentions which may be made by Southwestern, the Commission staff, or any affected party thereto, in any proceeding, including area rate or similar proceedings.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

THE ATLANTIC REFINING COMPANY, DOCKET NO. G–17741; TRANSCONTINENTAL GAS PIPE LINE CORPORATION, DOCKET NO. RP65–31

ORDER RELEASING REFUNDS

(Issued August 9, 1965)

The Commission by order[1] issued December 31, 1964, approved Atlantic's offer of settlement of its refund obligation to Transco under Atlantic's Rate Schedule Nos. 118, 147, and 150. Atlantic was ordered therein to retain the

[1] "Order Accepting Offer of Settlement, Severing and Terminating Proceeding, and Prescribing Refunds," *The Atlantic Refining Company*, Docket No. G–17741, 32 FPC 1554.

refund amount subject to further order of the Commission directing the disposition of those amounts. This retention was directed in keeping with our policy expressed in the order approving the Humble settlement[2] wherein we stated that it is "our duty to insure that the ultimate consumers of gas actually receive all of the benefits of our rate regulation to which they may be entitled," and that we were taking action "to assure that, within the limits of our jurisdictional reach, the refunds to be ordered actually flow to those parties legally and equitably entitled thereto."

Review of Transco's flow-through obligation shows that it is obligated by the Commission's order[3] approving Transco's settlement in Docket No. RP61–13 to flow-through the jurisdictional portion of the refund in this proceeding. All other pipelines in the resale chain which receive significant amounts are similarly obligated with the exceptions of The Manufacturers Light and Heat Company and United Natural Gas Company. Neither Manufacturers nor United Natural is presently obligated by prior Commission order to flow-through refunds received from Transco in Docket No. RP61–13. Accordingly, we have provided that Transco shall retain and defer its flow-through to Manufacturers and United Natural pending our further order.

The Commission orders:

(A) Atlantic and Morgan Guaranty Trust Company, the escrow agent appointed pursuant to Paragraph (E) of our order issued December 31, 1964, are jointly directed to release and pay over to Transco within 30 days of this order, the total amount assigned to Transco as specified in Atlantic's refund report filed May 13, 1965, together with the associated escrow earnings.

(B) Transco shall, pending further order of the Commission retain and defer the flow-through of those portions of the amount received pursuant to Paragraph (A) above which are attributable to purchases by The Manufacturers Light and Heat Company and United Natural Gas Company.

(C) The amounts ordered to be retained pursuant to Paragraph (B) above shall be retained by Transco in accordance with the methods set forth in Paragraph (J) of the Commission's "Order Releasing Refunds in Part," issued April 21, 1965, in *Humble Oil & Refining Company*, Docket No. G–9287, *et al.*, 33 FPC 830. Transco shall within 30 days of this order report the manner in which this amount will be retained.

(D) Except as specifically ordered to retain amounts and defer the flow-through to specified parties, each company shall flow-through the refunds received pursuant to this order and submit a report thereon in accordance with the applicable Commission orders governing its flow-through obligation.

(E) Where any pipeline subject to the jurisdiction of this Commission receives a refund as a result of this order and, contrary to our conclusion that the jurisdictional portion thereof will flow-through to its customers, claims the right to retain such amounts that pipeline shall report to the Commission within 10 days of the date of this order, the basis of such claim and, when the amount is received, that pipeline shall retain the amount in dispute, in accordance with Paragraph (C) above, subject to our further order.

(F) Where amounts have been retained pursuant to Paragraph (B) and the party which otherwise would have received such amounts is presently obligated

---

[2] "Order Conditionally Approving Rate Settlement Proposal, Severing and Terminating Proceedings, and Prescribing Refunds," *Humble Oil & Refining Co.*, Docket No. G–9287, *et al.*, issued July 8, 1964, 32 FPC 49.

to flow-through such amounts by prior order of the Commission or will voluntarily assume the obligation to flow-through such amounts, a report setting forth the details of such obligation or an agreement assuming an obligation to flow-through the refund shall be filed by such a party within ten days.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

CENTRAL ILLINOIS LIGHT COMPANY AND PANHANDLE EASTERN PIPE LINE COMPANY, DOCKET NO. CP65-406

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued August 9, 1965)

On June 17, 1965, Central Illinois Light Company (Applicant) filed in Docket No. CP65-406 an application pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Panhandle Eastern Pipe Line Company (Respondent) to establish a physical connection of its natural gas transmission facilities with the supply lateral to be constructed by Applicant, to construct appropriate metering facilities and to sell and deliver natural gas to Applicant for resale and distribution in the Villages of Manito and Green Valley, Illinois, as more fully described in the application.

Applicant proposes to construct and operate approximately 14 miles of 4-inch lateral pipeline from a point on Respondent's Peoria lateral to Green Valley and Manito, as well as the distribution systems in the villages.

The estimated volumes of natural gas required to supply the Villages' annual and peak day requirements for the initial three years of proposed operations are stated to be:

	First year	Second year	Third year
Annual (Mcf)	77,745	88,398	96,500
Peak day (Mcf)	668	765	857

The gas requirements for the villages will be made available from Applicant's presently certificated contract demand of 250,000 Mcf per day.

The total cost of the facilities to be constructed by Applicant is estimated to be $442,000, which will be financed from funds on hand. On July 22, 1964, the Illinois Commerce Commission issued an order and certificate of public convenience and necessity authorizing the construction and service, as proposed.

It is proposed that the gas be purchased by Applicant under Respondent's G-2 rate schedule. The application and exhibits demonstrate the project to be economically feasible.

Respondent was notified of the filing of the application by letter dated June 21, 1965. No answer has been received from Respondent.

Due notice of the filing of the application and opportunity for hearing thereon was published in the Federal Register on July 2, 1965 (30 F.R. 8498). No protest, petition to intervene or notice of intervention has been filed.

The Commission finds:

(1) Panhandle Eastern Pipe Line Company, a Delaware corporation having its principal place of business in Kansas City, Missouri, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the

Commission in its order of September 23, 1942, in Docket Nos. G–200 and G–207 (3 FPC 273).

(2) Applicant is a public utility company in the State of Illinois and is authorized to construct and operate facilities to distribute and sell natural gas to inhabitants of the communities along its system.

(3) It is necessary and desirable in the public interest that Respondent be directed to establish physical connection of its transportation facilities with the facilities proposed by Applicant and to sell and deliver up to 857 Mcf of natural gas per day to Applicant, as hereinbefore described and as more fully set forth in the application, as hereinafter ordered and conditioned.

(4) The requirement that Respondent serve Applicant, as requested, will not place an undue burden upon Respondent nor impair its ability to render adequate service to existing customers.

The Commission orders:

(A) Respondent is directed to establish physical connection of its natural gas transmission system with the facilities to be constructed by Applicant and to sell and deliver up to 857 Mcf of natural gas per day to Applicant, all as hereinbefore described and as more fully described in the application.

(B) Applicant shall be prepared to receive natural gas from Respondent within one year from the date of this order.

(C) Respondent shall notify the Commission of the commencement of service within 10 days thereof.

(D) Respondent shall execute and file with the Commission a service agreement with Applicant in accordance with the Commission's Regulations.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

FORT SMITH GAS CORPORATION, DOCKET NO. CP65–411

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On June 21, 1965, Fort Smith Gas Corporation (Applicant) filed in Docket No. CP65–411 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of facilities required to purchase the production from an additional gas well owned by Steve Gose (Operator), *et al.*,[1] in LeFlore County, Oklahoma, as more fully stated in the application.

Applicant will construct and operate approximately 3,315 feet of 4½-inch gathering line, together with necessary appurtenances and metering and regulating facilities, running from the gas well to a point of connection with Applicant's existing facilities.

Applicant desires the additional gas to maintain and augment its present gas supply and does not propose to serve any new areas.

Applicant will receive an average of 1,000 Mcf of additional gas per day at a price of 12.28 cents per Mcf. The estimated cost of the proposed facilities is $11,899, which will be financed with funds on hand. The proposal appears to be feasible.

---

[1] Steve Gose (Operator), *et al.*, were issued a certificate of public convenience and necessity authorizing the sale of additional gas to Applicant in Docket No. CI65–924 on May 11, 1965.

Due notice of the filing of the application was published in the Federal Register on July 2, 1965 (30 F.R. 8499). No protest, petition to intervene, or notice of intervention has been filed in this proceeding.

At a hearing held on August 5, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Fort Smith Gas Corporation, an Arkansas corporation having its principal place of business in Fort Smith, Arkansas, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of March 1, 1954, in Docket No. G–2333 (13 FPC 860).

(2) The facilities hereinbefore described and as more fully described in the application in this proceeding are proposed to be used in the transportation of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate hereinafter issued and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of said Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Applicant, Fort Smith Gas Corporation, authorizing the construction and operation of facilities as hereinbefore described and as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are hereby conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be completed and placed in actual operation and the transportation of natural gas authorized in paragraph (A) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within one year from the date of this order.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

MICHIGAN WISCONSIN PIPE LINE COMPANY, DOCKET NO. CP65–191

FINDINGS AND ORDER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On May 19, 1965, Michigan Wisconsin Pipe Line Company (Petitioner) filed in Docket No. CP65–191 a petition to amend, as supplemented on June 25, 1965,

the Commission's order issued March 30, 1965, 33 FPC 655, in said docket to authorize certain changes in the maximum daily quantities of natural gas to be delivered by Petitioner to five of its existing customers commencing on September 1, 1965, and to authorize service to American Gas Company under Petitioner's FPC Gas Rate Schedule SGS–1 in lieu of Petitioner's FPC Gas Rate Schedule ACQ–1, under which American Gas presently receives service, all as more fully set forth in the petition to amend in this proceeding.

The order of March 30, 1965, authorized Petitioner to construct and operate certain facilities and to sell and deliver an additional 75,000 Mcf per day of natural gas to certain existing customers. Since the date of authorization the following customers have requested changes in maximum daily quantities: American Gas Company (American Gas), Keokuk Gas Service Company (Keokuk), Michigan Gas and Electric Company (Michigan Gas), North Central Public Service Company (North Central) and Wapello Light Company (Wapello). Petitioner states that, since the preparation of the original application in this proceeding, the foregoing five customers have nominated maximum daily quantities of natural gas somewhat at variance with their prior nominations as set forth in Exhibit I of the original application. Therefore, Petitioner requests authorization to sell and deliver the following revised maximum daily quantities of natural gas to said five customers:

	Mcf at 14.73 psia		
	Exhibit I nomination	Revised nomination	Increase (decrease)
American Gas	1,300	2,880	1,580
Keokuk	10,400	10,100	(300)
Michigan Gas	52,500	53,800	1,300
North Central	17,096	19,000	1,904
Wapello	635	1,019	384

Authorization of the revised volumes will result in a net increase of 4,868 Mcf in maximum daily quantity. Petitioner has sufficient unallocated capacity to render the increased service.

Due notice of the filing of the petition to amend and opportunity for hearing thereon has been given by publication in the Federal Register on May 29, 1965 (30 F.R. 7261). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act, and the public convenience and necessity require that the Commission's order issued March 30, 1965, in Docket No. CP65–191 be amended as hereinafter ordered.

The Commission orders:

(A) The Commission's order issued March 30, 1965, in Docket No. CP65–191 is amended to authorize the changes in the maximum daily quantities of natural gas to be sold and delivered to American Gas, Keokuk, Michigan Gas, North Central and Wapello in accordance with the table hereinabove set forth and to authorize service to American Gas under Petitioner's FPC Gas Rate Schedule SGS–1 in lieu of Petitioner's FPC Gas Rate Schedule ACQ–1, all as hereinbefore described and as set forth in the petition to amend in this proceeding.

(B) In all other respects said order shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

MICHIGAN WISCONSIN PIPE LINE COMPANY, DOCKET NO. CP65-366

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On May 18, 1965, Michigan Wisconsin Pipe Line Company (Applicant) filed in Docket No. CP65-366 an application pursuant to Section 7(c) of the Natural Gas Act, as implemented by Section 157.7(b) of the Regulations under the Act, for a certificate of public convenience and necessity authorizing the construction during the 12-month period commencing July 13, 1965, and the operation of gas purchase facilities to enable Applicant to take into its certificated main pipeline system natural gas which will be purchased from producers thereof, all as more fully set forth in the application in this proceeding.

The purpose of this "budget-type" application is to augment Applicant's ability to act with reasonable dispatch in contracting for and connecting to its pipeline system new supplies of natural gas in various producing areas generally coextensive with said system.

The total cost of the facilities covered by this application will not exceed a maximum of $3,000,000, with no single project to exceed a cost of $500,000, which costs are proposed to be financed from funds generated from operations.

On June 21, 1965, Great Lakes Transmission Corporation and Trans-Canada Pipe Lines Limited each filed petitions to intervene in this proceeding; however, on July 29, 1965, said petitions were withdrawn.

After due notice, no other petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 5, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Michigan Wisconsin Pipe Line Company, a Delaware corporation having its principal place of business in Detroit, Michigan, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of July 14, 1950, in Docket No. G-1302 (9 FPC 167).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are proposed to be used in the transportation of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) It is necessary and appropriate in carrying out the provisions of the Natural Gas Act that Applicant should submit within 60 days after the expiration of the authorization granted hereinafter, a statement in compliance with Subparagraph (3) of Section 157.7(b) of the Commission's Regulations under the Natural Gas Act.

(6) Public convenience and necessity require that the certificate hereinafter issued and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of said Regulations.

(7) The authorization hereinafter granted should be limited to construction during the 12-month period commencing July 13, 1965, and the total expenditures for facilities to be constructed thereunder should be limited to a maximum of $3,000,000, with no single project to exceed a cost of $500,000.

The Commission orders:

(A) Upon the terms and conditions of this order, a certificate of public convenience and necessity is issued authorizing Applicant, Michigan Wisconsin Pipe Line Company, to construct during the 12-month period commencing July 13, 1965, the proposed facilities hereinbefore described, as more fully described in the application in this proceeding, and to operate such facilities only to take natural gas supplies from producers who have received authorization from the Commission to sell natural gas to said Applicant.

(B) Applicant shall submit within 60 days after the expiration of the authorization granted by paragraph (A) above a statement in compliance with Subparagraph (3) of Section 157.7(b) of the Commission's Regulations under the Natural Gas Act.

(C) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a) and (e) of Section 157.20 of said Regulations.

(D) The authorization granted in paragraph (A) above is limited to construction during the 12-month period commencing July 13, 1965, and the total expenditures for facilities to be constructed thereunder are limited to a maximum of $3,000,000, with no single project to exceed a cost of $500,000.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. CP65-397

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On June 11, 1965, Natural Gas Pipeline Company of America (Applicant) filed in Docket No. CP65-397 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of a 720 horsepower compressor station at Applicant's Keota Storage Field, Washington County, Iowa, and the withdrawal testing of such Field, all as more fully set forth in the application in this proceeding.

Applicant has been testing and developing the Keota Field pursuant to authorization granted by the Commission's order, issued October 10, 1963, in Docket No. CP64-13, 30 FPC 993. Applicant estimates that there will be approximately 1,000,000 Mcf of the authorized maximum of 1,500,000 Mcf of natural gas injected into the storage field by December 1, 1965. Applicant states that with an inventory volume of 1,000,000 Mcf the field will be sufficiently developed to under-

take the second phase of development which will be withdrawal testing. Therefore, Applicant requests authorization to install compressor facilities in order to conduct withdrawal testing during the winter of 1965–66 to evaluate and determine the deliverability capabilities of Keota Field. Applicant states further that the injection phase of testing was accomplished without the need of compressor facilities; however, such facilities are required for withdrawal testing. The gas to be withdrawn will be for testing purposes only and such gas will not be utilized to provide any additional service to Applicant's customers.

The estimated cost of the proposed facilities is $344,000, which cost will be financed from funds on hand.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 5, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Natural Gas Pipeline Company of America, a Delaware corporation having its principal place of business in Chicago, Illinois, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of October 13, 1942, in Docket No. G–235 (3 FPC 830).

(2) The facilities hereinbefore described, as more fully described in the application in this proceeding, are to be used in the transportation of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction and operation thereof by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The construction and operation of the proposed facilities and the proposed withdrawal testing by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued authorizing Applicant, Natural Gas Pipeline Company of America, to construct and operate the proposed facilities and to conduct withdrawal testing of the Keota Storage Field as hereinbefore described, all as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be constructed and placed in actual operation, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act, within 6 months from the date on which this order issues.

(D) In addition to the information contained in the quarterly reports required to be filed with the Commission by the order, issued October 10, 1963, in Docket No. CP64–13, Applicant shall also include in such reports the volumes of natural gas withdrawn and the maximum daily withdrawal rates.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

NORTHERN NATURAL GAS COMPANY, DOCKET NO. CP62–85

ORDER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On June 18, 1965, Northern Natural Gas Company (Applicant) filed in Docket No. CP62–85 an application to amend the certificate of the Commission issued in said docket on September 30, 1963, 30 FPC 859, which authorized Applicant to construct and operate certain facilities and to initiate natural gas service to 76 communities, including a sale to Milwaukee Gas Light Company (Milwaukee) for resale to Camp McCoy, Wisconsin, all as more fully set forth in the application to amend.

Milwaukee has advised the Applicant that it has not received the necessary contracts to sell and distribute natural gas at Camp McCoy. For the reason stated the Applicant requests that the aforementioned certificate authorization covering facilities and volumes of natural gas (first, second and third year contract demand volumes 60 Mcf, 154 Mcf and 273 Mcf respectively) for Milwaukee's service to Camp McCoy be deleted therefrom. Applicant states that when Milwaukee receives the necessary contracts and requests initial service for Camp McCoy, Applicant will seek Commission authority to supply such natural gas requirements.

Due notice of the subject application to amend and opportunity for hearing has been given by publication in the Federal Register on July 13, 1965 (30 F.R. 8806). Milwaukee Gas Light Company filed a petition to intervene in the proceeding, stating however, (1) it joins Northern's request for shortened procedure and does not seek a hearing herein and (2) it supports Northern's proposal to delete the authorization as to McCoy, if the Commission does not find Milwaukee's suggestion acceptable (that the Commission suspend rather than delete the provisions which authorizes the measuring station and which allocate first, second and third year contract demand volumes of natural gas for Camp McCoy). No protest or other petition to intervene has been filed concerning this amendment.

In view of the statements of Applicant and Milwaukee respecting service for Camp McCoy it appears deletion is more appropriate than suspension as suggested by Milwaukee.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the Commission's order issued September 30, 1963, in Docket No. CP62–85, be amended as hereinafter ordered.

The Commission orders:

(A) The Commission's order issued September 30, 1963, in Docket No. CP62–85 is amended so as to delete therefrom authorization to Northern Natural Gas

Company for facilities and volumes of natural gas required for service to Milwaukee Gas Light Company for Camp McCoy, Wisconsin, as requested by Applicant in the subject application to amend.

(B) In all other respects said order shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP60-94

FINDINGS AND ORDER FURTHER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On May 27, 1965, Tennessee Gas Transmission Company (Applicant) filed an application to amend further the Commission's opinion and order issued September 19, 1963, in Docket No. CP60-94 (G-16841, *et al.*, 30 FPC 759) to authorize the reallocation of volumes of natural gas to be sold and delivered to The Hartford Electric Light Company (Hartford) by Applicant, all as more fully set forth in the application to amend in this proceeding.

The opinion and order of September 19, 1963, authorized Applicant, among other things in Docket No. CP60-94, to sell and deliver a total volume of 14,325 Mcf of natural gas per day to Hartford under two separate gas sales contracts, each concerning a separate service area. By the Commission's order issued May 16, 1963, in Docket No. CP63-247 Applicant was authorized to increase further its daily deliveries to Hartford by 886 Mcf.

Pursuant to a request by Hartford, Applicant proposes herein, as follows, a reallocation of the volumes of natural gas delivered to Hartford for the Stamford and Torrington service areas:

[All volumes Mcf at 14.73 psia]

Service area	Authorized at docket No. CP60-94	Proposed reallocation		CP63-247 authorized increase	Total
		Increase (decrease)	Total		
Stamford	10,985	417	11,402	886	12,288
Torrington	3,340	(417)	2,923		2,923
Total	14,325		14,325	886	15,211

The application indicates that the proposed reallocation will enable Hartford to provide better service in its service areas.

Due notice of filing of the application to amend and opportunity for hearing thereon has been given by publication in the Federal Register on June 12, 1965 (30 F.R. 7685). No protest or petition to intervene has been filed in this proceeding.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the Commission's opinion and order issued September 19, 1963, in Docket No. CP60-94 (G-16842, *et al.*) be further amended as hereinafter ordered.

The Commission orders:

(A) The Commission's opinion and order issued September 19, 1963, in Docket No. CP60-94 (G-16842, *et al.*) is further amended to authorize the reallocation of volumes of natural gas to be sold and delivered to Hartford by Applicant in accordance with the table hereinabove set forth, all as hereinbefore described and as set forth in the application to amend.

(B) In all other respects said opinion and order, as amended, shall remain in full force and effect.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP65-342

FINDING AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 9, 1965)

On April 26, 1965, Tennessee Gas Transmission Company (Applicant), filed in Docket No. CP65-342 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of facilities and the sale of natural gas to Central Gas Company (Central), a wholly owned subsidiary of an existing customer, Alabama Tennessee Natural Gas Company (Alabama Tennessee), all as more fully set forth in the application.

Applicant proposes to sell and deliver the natural gas requirements of Central [1] commencing no later than November 1, 1965, by utilizing a portion of its unallocated pipeline capacity, and to construct and operate a meter station required therefor. The proposed meter station will be constructed near Applicant's Main Line Valve No. 554 in Lauderdale County, Alabama, at an estimated cost of $18,700, the cost of which will be defrayed from general funds or revolving credit source.

Central's estimated third year annual and peak day natural gas requirements are 187,740 Mcf and 2,023 Mcf, respectively. Central was authorized by Alabama Public Service Commission on April 1, 1965, to construct approximately 18 miles of 3- and 4-inch lines from the Applicant's sales meter to a point near Killen, Alabama. Central will sell to East Lauderdale County Gas District (District) the entire requirements of the District at or near the terminus of the line at Killen, and will also distribute gas in several small communities and to customers adjacent to the 18 mile line.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 5, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits submitted in support of the authorization, and upon consideration of the record,

The Commission finds:

(1) Applicant, Tennessee Gas Transmission Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order issued July 15, 1947, in Docket No. G-910 (6 FPC 777).

---

[1] Central will purchase gas under Applicant's Rate Schedule G-1 at development rate of 29.55 cents per Mcf.

(2) The proposed construction and operation of facilities and sale of natural gas as hereinbefore described, and as more fully described in the application and exhibits in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) The aforesaid proposed construction and operation of facilities and sale of natural gas are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Applicant, Tennessee Gas Transmission Company, authorizing the construction and operation of facilities and the sale and delivery of up to 2,023 Mcf of natural gas per day to Central as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all the applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be completed and placed in actual operation as provided in paragraph (b) of Section 157.20 of the Commission Regulations under the Natural Gas Act, within 12 months from the date on which this order issues.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

CAROLINA POWER & LIGHT COMPANY AND SOUTH CAROLINA ELECTRIC & GAS COMPANY, DOCKET NO. E-7227

ORDER AUTHORIZING ACQUISITION AND DISPOSITION OF FACILITIES

(Issued August 10, 1965)

Carolina Power & Light Company (Carolina Power) and South Carolina Electric & Gas Company (South Carolina Electric) filed a joint application with the Federal Power Commission on June 10, 1965, and a supplement thereto on June 18, 1965, for an order, pursuant to Section 203 of the Federal Power Act, authorizing the sale by Carolina Power and the acquisition by South Carolina Electric of 39.09 miles of 115 kv transmission line extending from South Carolina Electric's Saluda Hydroelectric plant to the midpoint of the line span over the Wateree River.

Carolina Power is incorporated under the laws of North Carolina and is qualified to do business in South Carolina. It is engaged in the generation, transmission, sale at wholesale, and distribution of electric energy in all or part of 55 counties in North Carolina and 13 counties in South Carolina. Its system is made up of two physically separated Divisions, Eastern and Western, which

are interconnected through the transmission facilities of Appalachian Power Company and Duke Power Company. It owns and operates an extensive interconnected network of electric generation and transmission facilities in North and South Carolina and in addition, it maintains high-voltage interconnections at the North Carolina-Virginia boundary with Appalachian Power Company and Virginia Electric & Power Company and at the North Carolina-Tennessee boundary with Appalachian Power Company and Tennessee Valley Authority.

South Carolina Electric is incorporated under the laws of South Carolina and is qualified to do business in Georgia. It renders electric service to the public in all or part of 24 counties in central, southern, and southwestern sections of South Carolina. It owns and operates the Stevens Creek hydroelectric generating station in Georgia and transmits the energy generated in this station over its transmission lines to its electric utility system in South Carolina where it sells at wholesale for resale part of this energy.

The facilities involved in this transaction consist of a segment of the 115 kv transmission line which extends from South Carolina Electric's Saluda Hydroelectric Plant to Carolina Power's Sumter Substation, including all wood poles and two steel towers, 35.51 miles of 397,500 CM, 26/7 ACSR conductor, 3.58 miles of 4/0, 12-strand copper conductor 39.09 miles of two 5/16" S.M. overhead ground wires for lightning protection, all hardware and support wires attached to the structures, together with all right of way easements owned by Carolina Power and upon which said line is located. This segment is the 39.09 mile portion from Saluda Hydroelectric Plant to the midpoint of the line span crossing the Wateree River, the boundary between the service areas of the companies.

The facilities which are to be transferred have been and are being used for the interchange of electricity between the systems of Carolina Power and South Carolina Electric. After the proposed transfer, the proposed use of the facilities will be the same as the present use thereof, and they will also be used by South Carolina Electric for the transmission of electricity within its own system.

According to the application, the transmission facilities are to be transferred from Carolina Power to South Carolina Electric for a cash consideration of $331,000. These facilities have an original cost less accumulated depreciation of $251,301. Carolina Power will realize a gross profit of $79,699 on the sale of the facilities. However, additional Federal and North Carolina Income Taxes of $42,017 on the profit will reduce the gross profit to a net profit of $37,682. On Carolina Power's books, the net profit of $37,682 will be credited to Surplus and $42,017 will be credited to Taxes Accrued. An electric plant acquisition adjustment of $79,699 will be created on the books of South Carolina Electric and this acquisition adjustment will be eliminated by a debit to Surplus.

According to the application, it is anticipated that, when the facilities described above, which lie wholly within the service territory of South Carolina Electric, are integrated with South Carolina Electric's other facilities, they can be maintained and operated more efficiently and effectively for the transmission of electricity within South Carolina Electric's own system and for the interchange of electricity between the systems of South Carolina Electric and Carolina Power. South Carolina Electric will also be able to use these facilities to supply its distribution system within the area and this should make for better voltage regulation on the distribution system.

Written notice of the application has been given to the North Carolina Utilities Commission and the South Carolina Public Service Commission and to the Governors of those States. Notice was also published in the Federal Register on June 24, 1965 (30 F.R. 8121), stating that any person desiring to be heard or to make any protest with reference to the application, should on or before July 7, 1965, file petitions or protests with the Federal Power Commission, Washington,

D.C., 20426. No petition or protest or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Carolina Power, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act, subject to the jurisdiction of the Commission, as heretofore described in the Commission's order issued January 31, 1957, *In the Matters of Carolina Aluminum Company, Carolina Power & Light Company*, Docket No. E-6712 (17 FPC 83).

(2) South Carolina Electric, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act, subject to the jurisdiction of the Commission as heretofore described and set forth in the Commission's order issued May 24, 1963, *South Carolina Electric & Gas Company and South Carolina Generating Company*, Docket No. E-7085 (29 FPC 1045).

(3) By the proposed transaction, Carolina Power will dispose of part of its facilities subject to the jurisdiction of the Commission and South Carolina Electric will merge or consolidate its facilities, subject to the jurisdiction of the Commission with those of Carolina Power, another person, all within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(4) The proposed transaction, as described above, upon the terms and conditions set forth in the application, and subject to the provisions of this order will be consistent with the public interest as expressed in Section 203 of the Federal Power Act.

(5) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) The proposed sale by Carolina Power and the proposed acquisition by South Carolina Electric of the aforementioned electric facilities, all as described above, is authorized and approved upon the terms and conditions and for the purposes set forth in the application subject to the provisions of this order.

(B) Carolina Power and South Carolina Electric shall record the proposed transaction herein authorized and the facilities and properties referred to above as provided in the Commission's Uniform System of Accounts Prescribed for Public Utilities and Licensees.

(C) This authorization shall expire unless the transaction herein authorized and approved is consummated within 90 days from the date of issuance of this order.

(D) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuations, estimates or determinations of cost, or any matter whatsoever now pending or which may come before this Commission or any other regulatory body and nothing herein shall be construed as an acquiescence by this Commission in any estimate or determination of cost or any valuation of property claimed or asserted.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

IOWA PUBLIC SERVICE COMPANY, DOCKET NO. E-7221

ORDER AUTHORIZING ACQUISITION OF FACILITIES

(Issued August 10, 1965)

Iowa Public Service Company (Public Service) filed an application on April 26, 1965, and an amendment thereto on July 6, 1965, with the Federal Power Com-

mission, for an order pursuant to Section 203 of the Federal Power Act, authorizing the acquisition of electric distribution facilities from the City of Sioux City (City), Iowa.

Public Service is an electric utility organized under the laws of Iowa with its principal business office at Sioux City, Iowa, and is engaged principally in the generation, purchase, transmission, sale at wholesale, and distribution of electric energy in 30 counties in northwestern and north central Iowa, three counties in eastern South Dakota, and one county in northwestern Nebraska. Public Service has a franchise to supply electric energy to the residents of Sioux City.

The City of Sioux City owns the land comprising the Sioux City Municipal Airport and the Sioux City Air Base which is leased to the United States Air Force. Electric energy has been supplied by Public Service, and the Air Force has operated its own electric distribution system which serves the area. In recent years, this area has been annexed into the corporate limits of the City. The City has completed negotiations with the Air Force whereby the latter has turned over to the City the land and the distribution system.

The facilities to be acquired by Public Service are the Airport distribution facilities now owned by the City. The Air Force will retain ownership of a short distribution line which supplies service to the Capehart Housing Development. Public Service states that it cannot acquire ownership to this line because it runs through the incorporated town of Sargeant Bluff wherein it has no franchise to operate. According to the application, Public Service will maintain and expand the service and facilities to the commercial and industrial users at the Airport site.

Public Service represents that the City is not in the business of selling electric energy and is not equipped to maintain adequately such facilities, nor does the City desire to engage in this business. Since Public Service for many years has been supplying the electric energy distributed over the facilities discussed herein, there will be no necessity to construct additional facilities to integrate the distribution system into Public Service's existing facilities or to construct additional generating capacity to supply the requirements of the area. According to the application, this transaction will have no effect on any contract for the purchase, sale or interchange of electric energy.

Public Service's cash consideration for the City's facilities will be $91,250. This amount is based on splitting the difference between Public Service's estimate of depreciated replacement cost of $79,500 and $103,000, which was computed by an engineering firm retained by the City. Since no records of the City or Air Force are available, an estimate of original cost of $102,365.63 was developed, less an accumulated provision for depreciation of $50,000 agreed to by Public Service after discussion with Commission's Staff. The transaction will result in the creation of an acquisition adjustment of $38,884.37 (consideration of $91,250—original cost depreciated of $52,365.63). Public Service proposes to eliminate the acquisition adjustment by a debit to Miscellaneous Debits to Surplus.

Written notice of the application has been given to the State Commerce Commission of Iowa and to the Governor of that State. Notice was published in the Federal Register on May 11, 1965 (30 F.R. 6502), stating that any person desiring to be heard or to make any protest with reference to the application should on or before May 19, 1965, file petitions or protests with the Federal Power Commission, Washington, D.C., 20426. No petition or protest or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) Public Service, a corporation, is a public utility within the meaning of Section 203 of the Federal Power Act, subject to the jurisdiction of the Commission as heretofore described and set forth in the Commission's order issued August 22, 1963, Iowa Public Service Company, Docket No. E-7115 (30 FPC 536).

(2) By the proposed acquisition as described above, Public Service will acquire and merge or consolidate its facilities subject to the jurisdiction of the Commission with facilities of Sioux City, another person, within the meaning and subject to the requirements of Section 203 of the Federal Power Act.

(3) The proposed acquisition of facilities by Public Service, as described above, upon the terms and conditions set forth in the application, and subject to the provisions of this order will be consistent with the public interest as expressed in Section 203 of the Federal Power Act.

(4) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) The proposed acquisition by Public Service of the aforementioned electric facilities, all as described above, is authorized and approved upon the terms and conditions and for the purposes set forth in the application subject to the provisions of this order.

(B) Public Service shall record the proposed transaction herein authorized and the facilities and properties referred to above, as provided in the Commission's Uniform System of Accounts Prescribed for Public Utilities and Licensees.

(C) The authorization shall expire unless the transaction herein authorized and approved is consummated within 90 days from the date of issuance of this order.

(D) The foregoing authorization is without prejudice to the authority of this Commission or any other regulatory body with respect to rates, service, accounts, valuations, estimates or determinations of cost, or any matter whatsoever now pending or which may come before this Commission or any other regulatory body.

based on actual experiences while latter's calculations are based on survey conducted when natural gas was not available. P. 463.

4. Residents of area involved should not be deprived of right to choose among competing and relatively economic sources of energy. PP. 464; 475.
5. Pipeline-distributor made adequate affirmative showing as to safety and soundness of engineering specifications and design with respect to its use of PVC plastic pipe. P. 464.
6. Commission *rejects* contention that pipeline-distributor does not qualify as a person "engaged or legally authorized to engage in local distribution of natural or artificial gas" within meaning of Section 7(a) of the Gas Act. PP. 464, 465.
7. Great Plains' certificate conditioned to require that no part of fee paid to HD&R [organizing firm] for engineering services which exceeded actual costs be included in plant accounts. PP. 465; 476.
8. There is no evidence that Great Plains' project was organized and conceived solely or primarily for purpose of providing profits for promoters in excess of actual cost incurred in performing necessary engineering services incident to organization and construction of proposed distribution system. P. 465.
9. Commission has jurisdiction over Great Plains' accounts under Section 8 of the Gas Act and authority to regulate propriety and amount of engineering fees to be included in plant accounts. P. 465.
10. In a proceeding under Sections 3 and 7 of the Natural Gas Act, Commission *authorizes* increase in quantity of imported gas; *issues* certificates of public convenience and necessity; and *directs* pipeline to connect its facilities with those of 7(a) applicants for delivery and sale of gas to them.

L. R. Pankonien for Midwestern Gas Transmission Company.

N. J. Lesselyoung for Milwaukee Gas Light Company.

Lambert McAllister and *Francis J. Walsh* for North Star Natural Gas Company and North Star Natural Gas Company of Wisconsin, Inc.

Peyton G. Bowman, III and *Richard M. Merriman* for Great Plains Natural Gas Co.

Thomas M. Knebel for Minn-Dak Fuel Association.

C. Louis Knight for Staff of the Federal Power Commission.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

BAGGE, *Commissioner:*

This consolidated proceeding involves applications filed by Midwestern Gas Transmission Company (Midwestern) under Sections 3 and 7 of the Natural Gas Act and by Milwaukee Gas Light Company (Milwaukee), North Star Natural Gas Company of Wisconsin, Inc. (Wisconsin North Star), and Great Plains Natural Gas Co. (Great Plains) under Section 7 of the Natural Gas Act.

On June 24, 1964, Midwestern applied for (1) in Docket No. CP64-308 authorization under Section 7(c) of the Act to increase its peak day firm sales of natural gas to four present customers on its northern system by 2,420 Mcf (at 14.73 psia), and (2) in Docket Nos. G-18314 and G-18315 authorization under Section 3 of the Act to increase by 18,360 Mcf (at 14.73 psia) the firm daily contract quantity of natural gas which it is authorized to import from Canada, without increasing the authorized maximum annual quantities of imported gas.

Milwaukee filed an application in Docket No. CP64-174 seeking an order under Section 7(a) of the Act directing Midwestern to sell natural gas to Milwaukee for resale and distribution in the cities of Neillsville, Greenwood, and Loyal, Wis-

consin. Wisconsin North Star in Docket No. CP65–9, and Great Plains in Docket No. CP65–13 applied for orders under Section 7(a) of the Act directing Midwestern to render natural gas service from its northern system. Great Plains further requested authorization under Section 7(c) of the Act to construct transmission lines, a peak shaving plant and distribution facilities.

The above applications were consolidated for hearing by Commission order dated November 9, 1964. Hearings were held on December 15 through 17, 1964, and on January 5, 1965. The following parties were permitted to intervene: Minn-Dak Fuel Association, Inc. (Minn-Dak), an association of petroleum dealers doing business in the area which Great Plains proposes to serve, opposing the Great Plains' proposal and Northern States Power Company (Northern), supporting Midwestern's application. The Public Service Commission of Wisconsin filed a notice of intervention and a reply brief but did not appear at the hearing. Great Plains was permitted to intervene in support of Midwestern's application. On March 31, 1965, the Presiding Examiner, William C. Levy, issued an initial decision in which, subject to certain specific conditions, he issued certificates of public convenience and necessity to the above-listed applicants.

The proceeding is before the Commission on the Examiner's decision, exceptions filed by Great Plains, the Staff, and Minn-Dak, and answers to these exceptions.

Midwestern's Applications

Midwestern's northern system brings gas from Canada to Minnesota, North Dakota and Wisconsin. It extends from the United States-Canada international boundary near Emerson, Manitoba, to a point near Marshfield, Wisconsin, where it connects with the facilities of its principal customer, Michigan Wisconsin Pipe Line Company. Midwestern's northern system facilities were authorized by the Commission on October 31, 1959, in Docket No. G–18313, *et al.* (Opinion No. 331, 22 FPC 775), and Midwestern was given permission to import from Canada a maximum daily quantity of 204,000 Mcf (at 14.73 psia). In Docket No. G–18315, Midwestern was granted a Presidential Permit for the construction, operation and maintenance of facilities for the importation of natural gas.

Midwestern stated that its northern system is presently authorized to make total peak day firm sales of 201,883 Mcf and that the volume of gas needed for company use as fuel on a peak day amounts to 2,056 Mcf; therefore, it has an unallocated peak day volume of gas available for sale of 61 Mcf.

On May 19, 1964, Midwestern and Trans-Canada Pipelines Limited (Trans-Canada) entered into a Precedent Agreement under which Midwestern, beginning November, 1967, will be entitled to purchase a firm peak day volume of 222,360 Mcf (at 14.73 psia), an increase of 18,360 Mcf per day over Midwestern's present peak day volume. Midwestern proposes to utilize 2,420 Mcf per day of this increase by adding to the volume of its present customers, as follows:

Customer	Present contract demand (Mcf)	Incremental peak day volumes requested beginning Nov. 1 (Mcf at 14.73 psia)				
		1964	1965	1966	1967	Total
Northern States Power Co	29,530			1,340		1,340
North Star Natural Gas Co	[1] 1,200			520	260	780
North Central Public Service Co	350	75	50	50	50	225
Village of Perham, Minn	600		50	25		75
Total	31,680	75	100	1,935	310	2,420

[1] For resale in Wadena and Staples, Minn., service areas.

Midwestern also proposes to utilize 7,461 Mcf per day of its increased imports to meet the third year peak day requirements presented by the Section 7(a) applicants in this proceeding and will then have a volume of 8,540 Mcf of unallocated gas available on a firm peak day basis for future service.

Staff did not oppose Midwestern's requests for increase in imports and for additional peak day service, but it urged that Midwestern's certificate be conditioned to require Midwestern to obtain Commission approval of proposed amendments to its gas purchase contract with Trans-Canada. Midwestern replied that Staff's proposed condition is unnecessary and impractical because Midwestern submitted all necessary contract and amendment information by filing with the Commission both the original contract and an amendment dated October 1, 1964, and that neither Midwestern nor Trans-Canada contemplates any changes in this submitted amendment. Midwestern pointed out that the amendment is definite and precise with respect to matters of price and demand quantities and stated that it will execute with Trans-Canada an amendment to its contract exactly in conformance with the evidence presented and with any authorization granted in this proceeding.

The Examiner found on the basis of the record before him that Midwestern's existing facilities are capable of receiving a daily volume of 222,360 Mcf from Trans-Canada, as proposed, and of delivering an additional 16,001 Mcf per day anywhere on the northern system. He found that the technical and economic feasibility of Midwestern's proposals was not disputed and that a study of estimated revenues and expenses showed that Midwestern's income from incremental sales will rise from $2,000 for 1965 to an estimated $41,000 in 1968. The gas purchased will be produced in fields in Canada and will be transported over previously authorized facilities. The Examiner noted that there will be no increase in the annual volume of natural gas to be imported and that Trans-Canada's annual minimum commodity charge to Midwestern will be increased only by the volume of gas actually made available and sold to new customers.

The Examiner approved the authorization of the Midwestern applications, subject to the conditions that Midwestern and Trans-Canada execute a formal amendment to their contract exactly in conformance with the evidence presented and the authorization granted and that this amendment be filed with the Commission. Staff has taken exception to the terms of the conditions imposed upon Midwestern, urging that prior to the exercise of any rights under its certificate, Midwestern should be required to file with the Commission for approval, and to serve upon all parties in this proceeding, the amendment to its gas purchase contract with Trans-Canada. It is our judgment upon consideration of the record in this matter, and particularly in reliance upon the assurance made by Midwestern, that the objectives sought by Staff can be accomplished by conditioning Midwestern's exercise of its rights under its requested certificate to its prior execution of the amendment to its contract with Trans-Canada and the filing thereof with the Commission, without requiring our further approval of such amendment. In all other respects we find that the Examiner's approval of Midwestern's applications is warranted by the record, and we approve and adopt his findings and conclusions.

In Docket No. G–18315 Midwestern requested amendment of the Presidential Permit issued to it on October 31, 1959, to enable Midwestern to increase from 204,000 Mcf to 222,360 Mcf the maximum volume of natural gas which it may import from Canada into the United States in any one day. Staff and the Examiner have taken the position that no amendment to the Presidential Permit is necessary in view of the fact that Midwestern does not propose any new construction or change of facilities at the International Boundary, and the Examiner has held that Midwestern may increase its import volume in this

case under the existing provisions of the Permit. We approve and adopt the Examiner's holding, and we find it to be consistent with the language of Executive Order No. 10485 and Sections 153.10 and 153.11 of the Commission's Regulations.

Milwaukee's Application

Milwaukee seeks authorization in Docket No. CP64-174 to initiate natural gas service to the cities of Neillsville, Greenwood, and Loyal, Wisconsin, and their environs. The proposed transmission and distribution facilities will be constructed at an estimated cost of $850,513. Third year revenues are estimated at $331,611, and third year rate of return is estimated a 5.89 percent. Milwaukee has applied for an order directing Midwestern to connect its facilities to this proposed project. Midwestern has granted its consent. The Public Service Commission of Wisconsin has approved the proposed service, and exclusive franchises have been obtained in each of the specified communities. The testimony presented by Milwaukee is uncontroverted, and no party has intervened in opposition. On the basis of the written and documentary showing submitted by Milwaukee, the Examiner approved Milwaukee's application and directed Midwestern to connect its facilities with those of Milwaukee and to sell and deliver to Milwaukee an additional 1,385 Mcf per day for distribution and sale in the cities of Neillsville, Greenwood, and Loyal.

We find upon consideration of the record in this matter that Milwaukee's application warrants our approval, and we adopt the Examiner's findings and conclusions with respect to this application.

Great Plains' Application

Great Plains, a Minnesota corporation which is also certificated to do business in North Dakota, has applied for an order under Section 7(a) of the Natural Gas Act directing Midwestern to render natural gas service from its northern system and has applied for authorization under Section 7(c) of the Act to construct transmission lines, a peak shaving plant and distribution facilities at a total estimated cost of $3,616,486. The communities which Great Plains proposes to serve are Fergus Falls, Breckenridge, and Pelican Rapids, Minnesota, and Wahpeton, North Dakota, with a total combined 1960 population of 25,637. These communities are presently without natural gas service.

Great Plains' application is opposed by Minn-Dak. Minn-Dak was permitted to intervene in this proceeding, and it attacked Great Plains' proposal on numerous economic and legal grounds.

The Examiner issued a certificate of public convenience and necessity to Great Plains subject to the conditions set forth in his ordering paragraph (G)1 requiring Great Plains to file (a) an acceptable financing plan, (b) a detailed statement of outstanding stock ownership, and (c) contracts on precedent agreements with prospective purchasers of interruptible gas service, and also subject to a limitation in ordering paragraph (G)2 on the amount of fees or engineering services to be included in the Great Plains plant accounts. Great Plains has filed exceptions to condition (G)1(c), and has objected to the limitation in (G)2 on the fees for engineering service. Minn-Dak has filed exceptions asserting that the Examiner is in error for reasons which may be summarized as follows: (1) Great Plains did not show that its proposal is economically feasible or is required by the public convenience and necessity; (2) Great Plains failed to show that the non-metallic pipe it proposes to use will meet the proper standards of safety; (3) Great Plains is not legally qualified to be certificated; and (4) approval of Great Plains' application is contrary to the public interest be-

cause it involves the payment of profits to an unregulated affiliate. For the reasons set forth below, it is our judgment that the Examiner's decision on Great Plains is essentially correct, and we approve and adopt such decision, except as modified below.

Economic Feasibility of Great Plains' Proposal

Great Plains proposes to connect to Midwestern's pipeline in Otter Tail County, Minnesota, and to construct 31.8 miles of 8-inch pipeline southwestward to Fergus Falls, with 5 miles of 3-inch pipeline lateral to Pelican Rapids, and to extend 26.2 miles of 6-inch pipeline westward to Breckenridge and Wahpeton on opposite sides of the Red River boundary between Minnesota and North Dakota. Great Plains has franchises to serve all four communities, and it received a conditional certificate from the North Dakota Public Service Commission.[1]

Great Plains estimated that the original cost of its transmission and distribution facilities will total $3,500,000, and that additional construction costs in the third year will be $116,486. Financing will be handled by the Omaha investment banking firm of Storz-Wachob-Bender Company whose president testified that approximately $2,300,000 will be raised through first mortgage bonds and that $1,200,000 will be obtained from the sale of common stock. Staff asked for more specific financing information and recommended that Great Plains obtain Commission approval of a financing plan which corresponds to that presented to the Securities and Exchange Commission, including a detailed statement showing the distribution of stock. Great Plains did not object to this requirement, and the Examiner included Staff's recommended conditions in his ordering paragraphs (G)1(a) and (b). We find that the insertion of these conditions is appropriate. We also find that Great Plains has in other respects presented an adequate explanation of its financing proposals in connection with its third-year construction costs.[2]

Great Plains proposes to purchase 5,472 Mcf of its peak day requirements and poses to serve will total 26,915 and that in its third year of operation it will serve 4,047 firm customers and 86 interruptible customers, with a peak day requirement of 7,078 Mcf and an annual requirement of 1,416,383 Mcf.

Great Plains proposes to purchase 5,742 Mcf of its peak day requirements and 1,384,263 Mcf of its annual requirements from Midwestern and to obtain the remainder of its needs by manufacturing propane air at its peak shaving plant. Great Plains based its projected rate of customer connection on the assumption that 55 percent of the total residential and commercial customers and 44 percent of the potential space heating customers will be connected by the third year. In arriving at these percentages Great Plains relied upon studies it made of communities which had been connected to natural gas lines in Minnesota, Iowa and Missouri and upon statistical data compiled by the Northern Natural Gas Company from communities served by its system. Great Plains also relied upon surveys it made of the heating needs and costs of the commercial and large volume customers in the four communities it proposes to serve. Great Plains estimated that it will earn a utility income of $213,521 and a rate of return of 6.10 percent by its third year of operation and that its average debt service ratio over a 23-year period during which its first mortgage will be amortized will be 1.97 percent, well above the Commission's standard minimum of 1.5 percent.

---

[1] Minnesota does not have a state commission with jurisdiction over the proposed project.

[2] Staff asked about Great Plain's arrangements for financing its third-year construction costs of $116,486, and in reply Great Plains explained that it is relying on an anticipated depreciation reserve of $118,747 and an anticipated working capital balance at the end of the second year of $360,460.

Minn-Dak attacked Great Plains' estimates of residential conversion to natural gas as being unduly high and contended that a survey which it conducted in 1963 in Fergus Falls, Breckenridge and Wahpeton shows that only 33 percent of the residential customers interviewed expressed an interest in converting to natural gas. Staff and Great Plains both challenged Minn-Dak's survey conclusions, pointing out that the survey does not cover commercial and large volume users. Staff also stated that Minn-Dak had submitted incomplete data from the survey, that the survey called for only a "yes or no" reply, therefore not reflecting the attitudes of householders who were undecided and that there is a substantial question as to whether replies given at a time when natural gas was not available will necessarily remain the same after gas has been on the market for two years. Great Plains criticized the survey for seeking replies on the basis of excessive conversion costs and argued that the survey actually corroborated its own market expectations because the reaction of the people surveyed prior to their exposure to a sales campaign showed that a larger number of householders were ready to convert to natural gas than Great Plains had anticipated for its first year's operation.

The Examiner found that Great Plains' estimates of its sales are reasonable and that the market for the proposed project is adequate. He agreed with the criticism leveled against Minn-Dak's survey by Staff and Great Plains and stated that the survey furnished "an insufficient evidentiary basis on which to rest definite conclusions regarding the volumes of gas which can be marketed in the three cities in the third year of Great Plains operation *after* service is installed and an aggressive sales program instituted", citing *East Tennessee Natural Gas Company*, Opinion No. 435, Docket No. CP64–21, July 17, 1964, 32 FPC 158, for the principle that the extent of actual sales depends in large part upon how energetic a sales campaign is conducted. Although Minn-Dak asserted that natural gas will prove to be a more expensive fuel in Fergus Falls then oil, the Examiner gave little weight to this contention, observing that even if the cost of gas should be somewhat higher than that of oil, a consumer might still select gas on the basis of the savings involved in the elimination of oil storage facilities and in the greater life expectancy and lower maintenance costs of gas burning equipment, as well as on the basis of the greater overall convenience in using gas.

We find that the Examiner's position on the above points is well reasoned and adequately buttressed by the evidence of record. In weighing the conflicting claims of Great Plains and of Minn-Dak, we have given consideration to the fact that Great Plains' estimates are based on the actual experiences of communities in Minnesota, Iowa and Missouri, while Minn-Dak's calculations are based upon a survey which was conducted at a time when natural gas was not available. The shortcomings and limitations of Minn-Dak's survey were accurately noted by the Examiner, and his reliance upon the precedent of *East Tennessee Natural Gas Company*, Opinion No. 435, Docket No. CP64–21, July 17, 1964, was appropriate.

We further find that the Examiner was correct in relying upon *East Tennessee Natural Gas Company, et al., supra*, to impose the condition set forth in his ordering paragraph (G)1(c). This condition requires Great Plains to file contracts on precedent agreements with prospective purchasers of interruptible gas service providing for the purchase of at least one-half of the planned sale of 610,841 Mcf per year by the second full year of operation. The record shows that these large volume sales are of critical importance to the feasibility of Great Plains' project. The exceptions filed to this ruling of the Examiner are without merit.

There is no substance to Minn-Dak's exception to the Examiner's ruling on the comparative costs of heating with gas and with No. 2 oil. We approve and adopt

the Examiner's disposition of this question. After observing that there was a conflict in the evidence as to which of the two fuels will prove to be the more economical in the Fergus Falls area,[3] the Examiner found that "This record justifies the conclusion that residents of the area involved should not be deprived of the right to choose among competing and relatively economic sources of energy."

Great Plains' Proposed Use of PVC Plastic Pipe

Great Plains' specifications call for the use of wrapped and coated steel pipe at pressure of 65 psig or more. Its lower pressure systems, particularly those operating at 15 psig, are designed to use non-metallic PVC pipe to handle local distribution. Great Plains' engineer testified that the distribution system was designed on the basis of 15 psig pressure using the Weymouth Gas Flow Formula and was in accordance with the American Standard Code for pressure pipelines—ASA B31.8—1963. He stated that PVC pipe has been used by the Peoples Natural Gas Division of Northern Natural Gas on the distribution systems of 14 communities. No question concerning the safety of Great Plains' design or specifications was raised during the hearing. Minn-Dak, nevertheless, asserted that the Examiner is in error for failing to find that Great Plains did not meet its burden of showing that its proposed use of PVC pipe will meet recognized standards of safety and will not endanger the public welfare.

The local distribution facilities in which the PVC pipe will be used are not subject to the Commission's jurisdiction. Furthermore, the record shows that Great Plains made an adequate affirmative showing as to the safety and soundness of its engineering specifications and design.

Great Plains' Legal Qualifications

Minn-Dak attacked the Examiner's findings concerning Great Plains' legal qualifications on the ground that Great Plains does not qualify as a person "engaged or legally authorized to engage in the local distribution of natural or artificial gas" within the meaning of Section 7(a) of the Natural Gas Act in that it has failed to obtain the necessary local authority to distribute and sell gas in the cities of Breckenridge, Minnesota, and Wahpeton, North Dakota. The crux of Minn-Dak's case is (1) that while Great Plains' franchise from the cities of Fergus Falls, Pelican Rapids and Wahpeton are twenty year periods, its franchise from Breckenridge is limited to a term of two years and (2) that Great Plains' Wahpeton franchise is circumscribed by the fact that the North Dakota Public Service Commission has granted only a conditional certificate.

Minn-Dak's attack merely restates its argument which was rejected by the Examiner. The facts of record and our decisions support the Examiner's position. See *Central City, Kentucky*, 18 FPC 163 (1957); *Tipton County Utilities Co., Inc., et al.*, 15 FPC 1362 (1956); *East Tennessee Natural Gas Co.*, 11 FPC 426 (1952).[4] Great Plains adequately explained that its franchise from Breckenridge is only for a two-year period because that is the maximum limit which the

[3] Great Plains estimated the average annual cost of heating a home with natural gas in the Fergus Falls area would be $189.50 compared with cost of $219.02 with No. 2 oil. Minn-Dak claimed that Great Plains had over-stated the cost of heating with oil by erroneously crediting oil burning equipment with a 70-percent efficiency factor, while the correct efficiency factor is 80 percent, and that on an 80 percent basis the cost of heating a home with No. 2 oil would be only $195.46 compared with a natural gas cost, exclusive of conversion charges, or $218.21.

[4] Minn-Dak's reliance on *Wisconsin Southern Gas Company*, 4 FPC 188 (1944), is misplaced. There, an application was denied because the applicant had not even attempted to secure state approval and had not received any authorization from the largest community to be served.

City Council can grant without a general election. The general election will be held after a supply of natural gas is obtained. Great Plains also explained that the North Dakota Public Service Commission directed Great Plains to appear before it with a Federal Power Commission order so it can ascertain whether a supply of natural gas will be made available to Great Plains for Wahpeton before issuing a final order. These explanations are satisfactory.

Great Plains' Affiliation With Henningson, Durham and Richardson

Great Plains was organized by the Omaha engineering firm of Henningson, Durham & Richardson, Inc. (HD&R), an organization experienced in designing gas transmission and distributing systems. HD&R incorporated Great Plains for the purpose of establishing the gas distribution system here proposed, and its President, Charles W. Durham, is President of Great Plains. HD&R proposes to do the engineering work in designing and constructing the Great Plains system, for which it will charge a fee of 7 percent (about $187,000) of the total construction costs. It intends to operate the system after construction and own at least 10 percent of the stock in the project. At the time of the hearing HD&R owned all of the stock in Great Plains.

Minn-Dak argued that the Examiner's approval of Great Plains' application would violate the "no profits to affiliates" rule which we applied in our decision in *Florida Gas Transmission Company*, 31 FPC 1402, Opinion No. 431, June 8, 1964. Staff, on the other hand, urged that in order to assure consistency with the *Florida Gas Transmission* case, the Examiner should subject the Great Plains' certificate to the requirement that no part of the fee paid to HD&R for engineering services which exceeded actual costs should be included in Great Plains' plant accounts. The Examiner adopted Staff's proposal and included the recommended condition in his ordering paragraph (G)2.

Great Plains and Minn-Dak both have filed exceptions to the Examiner's holding. Great Plains contends that it is a small, local distribution system and is more appropriately subject to regulation by local authorities than by the Commission. It also urges that consideration of the question of its affiliation is premature during the pendency of the *Florida Gas Transmission* appeal. Minn-Dak asserts that the Examiner's condition will not adequately safeguard the interests of Great Plains' consumers and investors and that the public interest requires the denial of Great Plains' application.

We do not find these exceptions persuasive. The Examiner found that there is no evidence of record that the Great Plains project was organized and conceived solely or primarily for the purpose of providing profits for the promoters in excess of the actual cost incurred in performing necessary engineering services incident to the organization and construction of the proposed distribution system. He also found that the Commission possesses jurisdiction over the accounts of Great Plains under Section 8 of the Natural Gas Act and that we have authority to regulate the propriety and amount of engineering fees to be included in its plant accounts. The condition proposed by the Examiner in paragraph (G)2, as applied to the fees to HD&R for engineering services on that portion of the Great Plains' system subject to our jurisdiction, represents a reasonable precautionary action. It is approved and adopted.

The Application of North Star Natural Gas of Wisconsin

Wisconsin North Star applied for an order under Section 7(a) of the Natural Gas Act directing Midwestern to establish a connection of its facilities with Wisconsin North Star's proposed natural gas branch lines and distribution system and to sell and deliver to Wisconsin North Star natural gas for resale

and distribution in the Villages of Boyceville and Colfax, Wisconsin. The population of Boyceville is 660 and that of Colfax 885. Wisconsin North Star was incorporated in July, 1962. It commenced local natural gas distribution to the community of Dresser, Wisconsin, in August, 1963. The company is a wholly-owned subsidiary of North Star Natural Gas Company, a Minnesota corporation (Minnesota North Star).

Wisconsin North Star proposes to spend $230,420 on the expansion of its system to Boyceville and Colfax, of which amount $36,620 will be for transmission lines (3 miles of 2-inch line to Boyceville and 0.8 mile of 2-inch line to Colfax from Midwestern's main line tap) and $193,800 for distribution systems. Third year peak day requirements are estimated at 604 Mcf, with 348 Mcf per day for Colfax and 256 Mcf per day for Boyceville. These estimates were made on the basis of Wisconsin North Star's calculations, after making a house to house survey, that in the third year of operation the meter saturation in the two villages would reach 70 percent of the ultimate potential.

Financing of the Wisconsin North Star proposal is to be handled on the basis of: (1) $162,000 in first mortgage bonds maturing over a 20 year period with no payment on principal for the first five years; (2) $18,000 in debentures maturing in 15 years with no payment on the principal for the first three years and (3) $60,000 in common stock. The applicant computed the rate of return on the $240,000 investment[5] as 4.8 percent for the first year of operation and 10.4 percent in the third year.

The Wisconsin North Star proposal was approved by the Public Service Commission of Wisconsin which, on October 27, 1964, issued a certificate authorizing Wisconsin North Star to construct and operate the proposed facilities and to sell and distribute natural gas at retail in the Villages of Boyceville and Colfax.

Staff questioned the financing proposals and the economic feasibility of Wisconsin North Star's project. The Examiner found, however, that the applicant's presentation both in its initial showing and in its reply brief adequately disposed of Staff's questions. He concluded that Wisconsin North Star had satisfactorily demonstrated that its proposals are economically feasible and can be adequately financed. The Examiner found that Boyceville had a slow but steady increase in population during the period 1930 to 1960 of approximately 19 percent and that Colfax had experienced a similar growth pattern until June 1958 when a tornado destroyed about 45 percent of the town. The Examiner pointed out that Colfax is now making a definite recovery from this destruction. He found that a 70 percent estimate of meter saturation for the two villages is reasonable in light of gas distributor experience in Staples and Wadena, Minnesota, and in Dresser, Wisconsin, where the meter saturation reached 83 percent after 16 months of operation. The Examiner noted that gas sales to two interruptible customers, the Colfax Cooperative Creamery Company and the Boyceville Farmers Cooperatives Creamery Association, will account for 41 percent of the project's total estimated revenues of $186,460 in the third year of operation. He further found that Wisconsin North Star has signed agreements with these two customers providing for five years service, and he concluded that there is no evidence or reason to believe that these customers will terminate or sharply curtail their use of natural gas at the end of the five year term.

We agree with the Examiner that Wisconsin North Star satisfactorily demonstrated that its project is economically feasible and that its financing arrangements are adequate. We accordingly approve and adopt the Examiner's findings and conclusions with respect to this applicant.

[5] In addition to its proposed expenditure of $230,420 on the expansion of its system to Boyceville and Colfax, Wisconsin North Star estimated that it would require approximately $9,580 for legal expenses and contingencies.

The Commission further finds:

(1) Applicants Midwestern Gas Transmission Company and Great Plains Natural Gas Co. are each "a natural-gas company" within the meaning of the Natural Gas Act.

(2) Applicants Milwaukee Gas Light Company and North Star Natural Gas Company of Wisconsin, Inc. are each "engaged or legally authorized to engage in the local distribution of natural or artificial gas to the public" within the meaning of Section 7(a) of the Natural Gas Act.

(3) The proposed facilities of Midwestern and certain of the proposed transmission facilities of Great Plains will be used in the transportation and sale of natural gas in interstate commerce for resale, subject to the jurisdiction of the Commission, and such facilities and proposed sales of natural gas, as more fully described in the applications and record herein, are subject to the requirements of Section 7 of the Natural Gas Act.

(4) The applications of Milwaukee, Great Plains and Wisconsin North Star for orders directing Midwestern to render natural gas service to these applicants and for the construction of facilities necessary for such service are subject to the requirements of Section 7 of the Natural Gas Act.

(5) The construction and operation of the facilities and the sales of natural gas proposed by applicants are required by the public convenience and necessity, and applicants are able and willing properly to do the acts and to perform the service proposed and to conform to the Natural Gas Act and the rules and requirements of the Commission pursuant to the law; therefore, certificates should be issued as hereinafter ordered and conditioned.

(6) The conditions attached to the certificates herein issued are required by the public convenience and necessity.

(7) The ability of Midwestern to render adequate service to its customers will not be impaired, and no undue burden will be placed upon it by reason of the sale, service, facilities or requirements herein ordered.

(8) Except as herein granted, the exceptions to the Examiner's decision should be denied.

The Commission orders:

(A) Certificates of public convenience and necessity are hereby issued to the applicants named in the caption of this decision, subject to the conditions imposed herein, authorizing the sale of natural gas in interstate commerce for resale for ultimate public consumption and for the construction and operation of any facilities necessary therefor which are subject to the jurisdiction of the Commission, all as are more fully described in the applications.

(B) Midwestern is authorized to sell maximum day volumes of natural gas to the following customers in the amounts stated:

Customer	Presently authorized peak day service	Date and volume of proposed peak day service			
		Date of authorization	Nov. 1, 1965	Nov. 1, 1966	Nov. 1, 1967
North Central Public Service Co	350	425	475	525	575
North Star Natural Gas Co	1,200	1,200	1,200	1,720	1,980
Northern States Power Co	29,530	29,530	29,530	30,870	30,870
Perham, Minn. (Village of)	600	600	650	675	675

(C) Paragraph (M) of the orders issued to Midwestern under Docket No. G-18314, on October 31, 1959 (22 FPC 775, 803), is hereby amended to read as follows:

(M) Midwestern is hereby authorized, subject to the conditions specified herein, to import from Canada into the United States a maximum of 222,360 Mcf of natural gas per day at a point of interconnection on the International Boundary near Emerson, Manitoba, and Noyes, Minnesota.

(D) As a condition to the exercise of any right under these orders authorizing an increase in the maximum day volumes of natural gas to be sold by Midwestern and an increase in the maximum day volumes of natural gas to be imported into the United States by Midwestern, Midwestern shall, prior to the exercise of any such right, file with the Commission an executed formal amendment to the gas purchase contract which was made April 14, 1960, by and between Midwestern and Trans-Canada, which amendment shall be exactly in conformance with the evidence presented and the authorization granted in this proceeding.

(E) Midwestern is hereby directed to establish and maintain a physical connection of its transportation facilities with the facilities of Great Plains at a point in Otter Tail County, Minnesota, and to construct, operate and maintain meter facilities at the point of connection at Midwestern's expense and to sell and deliver to Great Plains through said connection natural gas in volumes not to exceed 5,472 Mcf in any one day, as measured at a pressure of 14.73 psia, for resale by Great Plains in Pelican Rapids, Fergus Falls and Breckenridge, Minnesota, and in Wahpeton, North Dakota, as described in this proceeding.

(F) Midwestern shall report promptly to the Commission in writing and under oath the dates of commencement and completion of construction by it and the date of commencement of the above described service to Great Plains.

(G) Great Plains shall report promptly to the Commission in writing and under oath the dates of commencement and completion of construction by it and the date of commencement of operation of its facilities ordered herein.

(H) Prior to the exercise of any right, under the certificate issued to Great Plains herein, there shall be compliance with the following conditions:

1. Great Plains shall file with the Commission under oath, serve on each of the parties to this proceeding and obtain the Commission's approval of a financing plan which shall correspond to the financing plan presented to the Securities and Exchange Commission;

2. Great Plains shall file with the Commission a statement under oath regarding the present outstanding stock of Great Plains showing the type, terms and conditions of such stock, the number of shares issued, when and to whom issued, the present owners, the valuation placed thereon at the time of issue, and the consideration for which they were issued;

3. Great Plains shall file with the Commission acceptable contracts on precedent agreements with prospective purchasers of interruptible gas service providing for the purchase of at least one-half of the planned sale of 610,841 Mcf per year by the second full year of operation;

4. No part of the fee paid to the firm of HD&R for engineering services on any portion of the Great Plains' system subject to the Commission's jurisdiction which exceeds the actual costs incurred in performing such services shall be included in Great Plains plant accounts.

(I) Midwestern is hereby directed to connect its facilities with those of Wisconsin North Star and to sell and deliver to Wisconsin North Star an additional 604 Mcf per day for distribution and sale in Colfax and Boyceville, Wisconsin, as described in this proceeding.

(J) Midwestern is hereby directed to connect its facilities with those of Milwaukee and to sell and deliver to Milwaukee an additional 1,385 Mcf per day for distribution and sale in the cities of Neillsville, Greenwood and Loyal, Wisconsin, and environs, as described in this proceeding.

(K) The Examiner's decision, to the extent not inconsistent herewith, is hereby adopted as part of this Opinion and Order.

(L) Except as herein granted, the exceptions to the Examiner's decision are hereby denied.

INITIAL DECISION

OF THE PRESIDING EXAMINER UPON APPLICATIONS FOR CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY, AUTHORIZATION TO INCREASE IMPORTS, EXISTING SERVICE, AND PROVIDE NEW SERVICE

(Issued March 31, 1965)

LEVY, *Presiding Examiner:*

This proceeding is before the Federal Power Commission by reason of three applications filed on June 24, 1964, by Midwestern Gas Transmission Company (Midwestern), seeking authorization under Section 7(c) of the Natural Gas Act to increase its peak day firm sales of natural gas to four present customers[1] on its northern system by 2420 Mcf, and to increase by 18,360 Mcf the firm daily contract quantity of natural gas which it is authorized to import from Canada, pursuant to Section 3 of the Act, without increasing the authorized maximum annual quantities of imported gas.

This proceeding also involves three applications filed by Milwaukee Gas Light Company (Milwaukee), North Star Natural Gas Company of Wisconsin (Wisconsin North Star), and Great Plains Natural Gas Co. (Great Plains), pursuant to Section 7(a) of the Act requesting that Midwestern be directed to render natural-gas service from its northern system. Great Plains also seeks authorization under Section 7(c) of the Act to construct transmission lines, a peak shaving plant, and distribution facilities at a total estimated cost of $3,616,486.00.

By order issued November 9, 1964, these proceedings were consolidated and a hearing held on September 15, 16, and 17, 1964, and January 5, 1965. Minn-Dak Fuel Association, Inc. (Minn-Dak), an association of petroleum dealers operating in the area proposed to be served by Great Plains, was permitted to intervene in opposition to the Great Plains proposal. Northern States Power Company (Northern), Minneapolis, and Great Plains were permitted to intervene in support of Midwestern's application. The Public Service Commission of Wisconsin filed a notice of intervention and a reply brief, but did not appear at the hearing. Cross-examination of Milwaukee Gas[2] witnesses was waived with the consent of all the parties, and its testimony and exhibits received in evidence. Briefs were submitted by all parties, and a motion filed by Staff on February 18, 1965, to strike parts of the reply brief of North Star.

Midwestern's Applications

Midwestern's northern system extends from the United States-Canada International Boundary near Emerson, Manitoba to a point near Marshfield, Wis-

[1] Northern States Power Company, North Star Natural Gas Company of Minnesota, North Central Public Service Co. and Village of Perham, Minnesota. Midwestern's original application included a fifth customer, American Gas Co. of Wisconsin, which later canceled its agreement to purchase additional gas.

[2] On December 7, 1964, Milwaukee filed a motion to sever Docket No. CP64-174 from the consolidated proceedings and dispose of Milwaukee's application pursuant to the shortened procedure provided by Section 1.32(b) of the Commission's Rules.

consin where it connects with the facilities of its principal customer, Michigan Wisconsin Pipe Line Company. Construction and operation of Midwestern's northern system which brings gas from Canada to Minnesota, North Dakota, and Wisconsin, were authorized by the Commission on October 31, 1959 (Opinion No. 331) under Docket No. G–18313, *et al.* (22 FPC 775). This same order authorized Midwestern to import from Canada a maximum daily quantity of 204,000 Mcf. Midwestern and Trans-Canada have entered into a Precedent Agreement (Exh. 2) under which Midwestern will be entitled to purchase a firm peak day volume of 222,360 Mcf effective November 1, 1967. This increased peak day volume of gas available from Canada will allow Midwestern to serve the demands of 7(a) applicants in these proceedings. No additional facilities were requested or are required by Midwestern to receive the increased peak day volumes from Trans-Canada or to render the additional service.

The peak day service proposed may be summarized as follows:

Customer	Present contract demand (Mcf) (exhibit 3)	Incremental peak day volumes requested beginning Nov. 1 (Mcf at 14.73 psia)				
		1964	1965	1966	1967	Total
Northern States Power Co.	29,530			1,340		1,340
North Star Natural Gas Co.	[1] 1,200			520	260	780
North Central Public Service Co.	350	75	50	50	50	225
Perham, Minn., Village of	600		50	25		75
Total	31,680	75	100	1,935	310	2,420

[1] For resale in Wadena and Staples, Minn., service areas.

Authorization to import an additional 18,360 Mcf per day from Trans-Canada, its sole source of supply, over the present peak day volume of 204,000 Mcf, will give Midwestern's northern system a gas supply adequate to meet both the 2420 Mcf per day increased requirements of existing customers, as proposed at Docket No. CP64–308, and 7461 Mcf per day of third year peak day requirements presented by the Section 7(a) applicants in this proceeding. In addition, Midwestern will have a volume of 8540 Mcf of unallocated gas available on a firm peak day basis for future service to either new or existing customers. Midwestern's existing facilities are capable of receiving a daily volume of 222,360 Mcf from Trans-Canada, as proposed, and delivering an additional 16,001 Mcf per day anywhere on its northern system (Exhs. 5–9).

The technical and economic feasibility of Midwestern's proposals is not disputed. A study of estimated revenues and expenses shows operating income from incremental sales rising from $2,000 for 1965, to an estimated $41,000 in 1968 (Exh. 10, Tr. 46). (Trans-Canada's annual minimum commodity charge to Midwestern will be increased only by the volume of gas actually made available and sold to new customers.) The gas purchased will be produced from fields in Canada and will be transported over previously authorized facilities (22 FPC 775). The annual volumes of natural gas to be imported will not be increased.

The market evidence submitted by Midwestern's existing customers in support of their applications for additional peak day service is uncontradicted. While Staff questions the adequacy of the supporting data in respect of the presentation of Northern and North Star, it does not oppose authorization of the additional service.

Staff does propose that Midwestern's certificate be conditioned so as to require that "prior to the exercise of any right under the certificate and authorization issued to Midwestern herein, Midwestern shall file with the Commission and serve upon all parties to this proceeding and shall obtain the Commission's ap-

proval of the amendment to the gas purchase contract which was made April 14, 1960, by and between Midwestern and Trans-Canada Pipelines, Limited, which amendment shall effectuate the objectives of Midwestern's application in this proceeding." (Br. pp. 19, 20.) The basis for the proposed condition is Midwestern's alleged failure to place in evidence the proposed amendment to its gas purchase contract with Trans-Canada (Exhs. 1, 2).

Midwestern maintains that the proposed condition is unnecessary and impractical since both the original contract and the amendment dated October 1, 1964, have been filed with the Commission which now has all the information it needs to approve or disapprove Midwestern's proposals. Moreover, argues Midwestern, the condition requested by Staff would require the amendment of its contract with Trans-Canada before it knew whether its proposal would be approved. The letter agreement dated August 19, 1964, in evidence as Exhibit 2, contains the terms of the agreement between Midwestern and Trans-Canada, which terms and conditions are incorporated in the amendment filed with the Commission on October 1, 1964. Since the Commission has before it all of the terms of the proposed amendment agreed to between Midwestern and Trans-Canada, and nothing is left for future agreement, the substance of the proposed amendment can be approved *now* without delaying action by the Commission until after the amendment is formally executed. This approval, however, is subject to the condition, to which Midwestern has no objection, that Midwestern and Trans-Canada will execute a formal amendment to the contract exactly in conformance with the evidence presented and the authorization granted in this proceeding, and that such amendment will be filed with the Commission.

Amendment of Midwestern's Presidential Permit

On October 31, 1959, Midwestern was issued a Presidential Permit for the construction, operation, and maintenance of facilities at the International Boundary and authorized to import from Canada a maximum daily quantity of 204,000 Mcf (22 FPC 775, 800). Midwestern now requests that the Presidential Permit be amended so as to increase from 204,000 Mcf to 222,360 Mcf, the maximum volume of natural gas which Midwestern may import from Canada into the United States in any one day. No alteration of existing facilities, authorized and constructed pursuant to the Presidential Permit, or additional construction, is involved. Article 3 of the Permit reads as follows:

> The natural-gas facilities authorized herein, or which may subsequently be included herein by modification or amendment, may be utilized for the transportation of natural gas from Canada to the United States only in the amount, at the rate, and in the manner authorized by the Commission under Section 3 of the Natural Gas Act.

Staff interprets Article 3 as authorizing Midwestern to use the natural-gas facilities authorized and constructed pursuant to the Permit for the transportation from Canada to the United States of natural gas in any amount which may be authorized from time to time by the Commission under Section 3 of the Natural Gas Act. So long as there is no change in the facilities previously authorized and constructed under the Presidential Permit, there is no limitation on the volumes of gas which the Commission may authorize to be transported. Accordingly, it is Staff's position that no amendment to the Presidential Permit is necessary in view of the fact that Midwestern does not propose any new construction or change of facilities at the International Boundary. As noted previously, Staff does not oppose Commission authorization under Section 3 of the Act of an increase in the maximum daily volume of natural gas which Midwestern may import from 204,000 Mcf to 222,360 Mcf.

Staff's interpretation of the Presidential Permit issued to Midwestern pursuant to Executive Order No. 10485, and Sections 153.10 and 153.11 of the Commission's Regulations, as a facilities permit is not contested in Midwestern's reply brief and is consistent with the language of the Executive Order and the Regulations which deal specifically with the construction, operation, maintenance, and connection of facilities at an International Boundary. No amendment of the Presidential Permit is required and the requested increase in gas import is authorized pursuant to Section 3 of the Act as consistent with the public interest.

Section 7(a) Applications

The three 7(a) applicants, Milwaukee, Wisconsin North Star, and Great Plains, seek a total peak day gas supply of 7461 Mcf, an amount well within Midwestern's additional peak day capacity as proposed in this proceeding.[3] As noted by Staff,[4] each 7(a) applicant must demonstrate the economic feasibility and financeability of its proposed project, the public need for and the benefit from the proposed service, and that Midwestern is the applicant's most feasible source of supply. The cost to Midwestern of necessary side valves and meter stations to render service to each of these applicants is approximately $15,000.

Great Plains

Great Plains proposes to build gas distribution facilities in Fergus Falls, Breckenridge, and Pelican Rapids, Minnesota and Wahpeton, North Dakota, communities presently without natural-gas service. Great Plains has franchises to serve all four towns, and a conditional certificate from the North Dakota Public Service Commission.[5] The Great Plains application is opposed by the Minn-Dak Fuel Oil dealers. Approval is recommended by Staff, subject to certain specified conditions (Staff br. pp. 49–53).

From the point of connection with Midwestern's pipeline in Otter Tail County, Minnesota, Great Plains proposes to construct 31.8 miles of 8-inch pipeline southwestward to Fergus Falls, 26.2 miles of 6-inch pipeline westward to Breckenridge and Wahpeton on opposite sides of the Red River boundary between Minnesota and North Dakota, and 5 miles of 3-inch pipeline lateral to Pelican Rapids, at a total cost of $3,616,486 (Exhs. 49, 50, 51, 55, Tr. 429–435).

Mr. M. J. Warren, president of the investment banking firm of Storz-Wachob-Bender Company (Storz), Omaha, the financial witness for Great Plains, anticipates that the approximately $3,500,000 total financing will consist of $2,300,000 of first mortgage bonds and $1,200,000 of common stock. Staff feels that the tentative financing proposed by applicant is to uncertain and contingent for Commission approval at this time, and the precise method of financing the project should be presented to the Commission before final approval. Accordingly, Staff proposes that Great Plains be required to file and obtain Commission

[3] Allocation of Midwestern's present and potential peak-day gas supply (Mcf/d at 14.73 psia):

Midwestern's present import authorization		204,000
Contract demands of present customers (T. 130, 138)	201,883	
Company use (T. 140)	2,056	
Total of present requirements		203,939
Unallocated gas		61
Increase requested in import authorization		18,360
Midwestern's potential peak-day gas supply		18,421
Proposed increase in contract demands of present customers	2,420	
Requested by 7(a) applicants	7,461	
Potential additional peak-day requirements		9,881
Potential unallocated gas		8,540

[4] Citing *American Louisiana Pipe Line Co.* (16 FPC 897).

[5] Minnesota does not have a state commission with jurisdiction over the proposed project.

approval of a financing plan which shall correspond to the plan presented to the Securities and Exchange Commission, including a statement regarding the number of shares issued, when and to whom issued, and the type, terms, and conditions of such stock. The reply brief submitted by Great Plains does not appear to object to the imposition of such a condition, and the issuance of the certificate will be conditioned accordingly.

Staff also questions how construction for the third year in the amount of $116,486 will be financed. Great Plains points to the reserve for depreciation and amortization ($118,747) and a working capital balance at the end of the second year of $360,460 (Exh. 56, p. 6) for this purpose.

Minn-Dak's Opposition to Great Plains

Minn-Dak is a nonprofit corporation whose membership includes 25 small independent oil jobbers, agents, and cooperatives located and engaged in the distribution and sale of fuel oil in Fergus Falls, Breckenridge, Wahpeton, and Pelican Rapids, the areas (Western Minnesota and North Dakota) involved in the application of Great Plains. They employ 121 persons with an annual payroll of $543,268 and an over-all investment in plant and equipment in excess of $800,000. Sales total about 11,432,494 gallons of fuel oil per year, predominantly for space heating, with annual gross revenues of about $1,693,466.

Minn-Dak opposes the proposed Great Plains project on both legal and economic grounds. It argues that the project is not economically feasible because Great Plains has overestimated the number of residential customers who would convert to gas, the volumes of gas that would be sold to residential users, and the revenues that would be derived from such sales. Rather than benefiting the consumer, authorization would be contrary to the public interest according to the testimony of its policy witness, Mr. Vraspir, because:

> By entering the market at rates pegged to overstated market projections, a gas distributing company is permitted to compete initially at a favorable price advantage. When, after two or three years the market fails to develop as projected, the company can, as a utility, obtain the revenues which do not materialize through higher rates. As a result, the fuel oil retailers, who compete with each other as well as the gas company at prices geared to the market, are hurt in that they have lost a portion of their market as a result of the temporary price disadvantage. More importantly to this Commission, it hurts the consumer who at the prospect of long term fuel economies irrevocably converts or replaces his heating equipment and domestic appliances at great expense only to find that the prospective fuel savings which made the expense feasible and/or desirable will not materialize (Tr. 493, 494).

D. R. Stuart, Great Plains vice president, chief mechanical engineer for the firm of Henningson, Durham & Richardson (HD&R), consulting engineers and architects, and market witness, estimated Great Plains third year peak day gas requirements as 7,078 Mcf and total annual requirements as 1,416,383 Mcf.[4]

[4] Great Plains estimated requirements for natural gas and propane air, 3d year (exhibit 53):

	Population		Number customers, 3d year		Requirements, 3d year (Mcf)	
	1960 actual	1966 estimate	Firm	Interruptible	Peak day	Annual
Breckenridge	4,335	4,695	776	10	1,340	210,968
Fergus Falls	13,733	14,189	1,829	60	3,135	760,127
Pelican Rapids	1,693	1,705	364	5	654	169,928
Wahpeton	5,876	6,326	1,078	11	1,949	275,360
Total	25,637	26,915	4,047	86	7,078	1,416,383

Of this amount, an estimated 5,472 Mcf on a peak day and an estimated 1,384,263 Mcf annually would be natural gas purchased from Midwestern. The remainder would be propane air produced by Great Plains peak shaving plant (Exh. 58). Great Plains projected rate of customer connection assumes that 55 percent of the total residential and commercial customers and 44 percent of the potential space heating customers would be connected by the third year (Exh. 53, p. 11).

Minn-Dak's policy witness, Mr. Vraspir, concluded on the basis of a survey made by Dr. Hektner that Great Plains substantially overestimated the prospective number of residential gas connections by the third year of operation. Based on Dr. Hektner's market surveys, Minn-Dak concludes that the average number of residential gas customers in Great Plains third year of operation would be only 2234 [7] instead of 3682 as estimated by Great Plains (Exh. 69).

However, Minn-Dak's market survey has certain limitations which prevent it being used uncritically as the basis for findings regarding the volumes of gas which can be marketed in the three cities covered by the survey. Minn-Dak's survey covered 16.5 percent, 23.8 percent, and 15.6 percent of the potential residential gas customers in Fergus Falls, Breckenridge, and Wahpeton. It does not include commercial and large volume sales which aggregate 735,755 Mcf, or 54 percent of Great Plains estimated total third year sales of 1,345,565 Mcf. Large volume potential sales alone, which Great Plains lists by name, constitute 45 percent of its estimated third year sales (Exh. 53).

Turning to the survey itself, we are told (Exh. 74) that of the 1071 householders interviewed in the three cities, 341, or approximately one-third, expressed an interest in converting to natural gas for one of more uses. It does not follow that all of the other 730 householders comprising two-thirds of the total number interviewed would not convert to natural gas for any use if in fact gas service was installed and made available on the basis proposed, and one-third of their neighbors converted to gas. The form makes provision for only yes or no answers (Exh. 71), and furnishes an insufficient evidentiary basis on which to rest definite conclusions regarding the volume of gas which can be marketed in the three cities in the third year of Great Plains operation *after* service is installed and an aggressive sales program instituted. On cross-examination Mr. Stuart testified for Great Plains that his estimate for connections by the third year (55 percent of total customers and 44 percent of potential space heating) was conservative and based on actual experience in similar communities (Tr. 456–458, 480). Moreover, the Minn-Dak survey assumes minimum gas conversion costs at prices which are disputed as excessive. Its estimates were not solicited from companies actually engaged or experienced in natural-gas conversion.

Minn-Dak also claims that the cost of heating a home in the proposed service area with oil is 19 percent less than it would be with gas. If conversion costs are not included, the saving is approximately 11 percent (Exh. 70). The dollar figures are $195.46 for No. 2 oil and $218.21 with gas, an annual saving according to Mr. Vraspir of $22.70 with oil. Great Plains estimates $189.50 as the average annual cost of heating a home with gas as against $219.02 with No. 2 oil, an

[7] Exhibit 69:

	Applicant exhibits 43/60	Minn-Dak exhibit 69	Percent of reduction
Number of customers	3,682	2,234	39.3
Annual sales, Mcf	609,810	396,327	35.0
Annual revenue	$759,304	$489,591	35.5
Annual sales all customers, Mcf	1,416,383	1,202,749	15.0
Annual revenue all customers	$1,213,861	$946,148	22.2

annual saving of $29.52 in favor of gas.[8] In evaluating these conflicting estimates it should be observed that even where natural gas costs somewhat more than oil, it may, nevertheless, make for a less expensive total heating system if we include such factors as the extra cost of storage facilities for oil, shorter life expectancy of the oil burner, and higher initial installation costs of oil burning equipment. There are also considerations of delivery, maintenance, and convenience which may influence a customer's choice in the selection of competing fuels. Moreover, Minn-Dak's Exhibit No. 72 shows electricity is the principal fuel used for cooking and water heating in the areas surveyed, which indicates, as noted by Staff, that Great Plains can expect "stiff competition" from the Otter Tail Power Company as well as Minn-Dak's fuel dealers.

Summarizing, the Examiner concludes that Great Plains estimate of its sales is reasonable and that, on the basis thereof, the market for the proposed project is adequate. This record justifies the conclusion that residents of the area involved should not be deprived of the right to choose among competing and relatively economic sources of energy. As noted by the Commission in *East Tennessee Natural Gas Company*, Opinion No. 435, Docket No. CP64–21, issued July 17, 1964, *supra*, the extent of actual sales depends in large part upon how energetic a sales campaign is conducted.

Minn-Dak properly notes that the large volume sales are of critical importance to the feasibility of the project and that applicant has not submitted a single contract or letter of intent to support a single large volume sale. In order to remedy this deficiency and further assure the feasibility of the project, it will be appropriate to require, as did the Commission in the *East Tennessee Natural Gas Company* case, cited *supra*, that before applicant undertakes construction it shall file with the Commission acceptance contracts or precedent agreements with prospective large volume purchasers of interruptible gas service providing for the purchase of at least one-half of the planned large volume interruptible sale of 610,841 Mcf per year by the second full year of operation (Exh. 53, p. 5).

Peak Shaving Facilities

Minn-Dak disputes the economic feasibility of Great Plains proposed peak shaving plant on the ground that the rates proposed would not cover the cost of providing the service. An analysis of Minn-Dak's figures does not support its conclusions. If we assume, as does Minn-Dak, that the unit cost of 32,120 Mcf of peak shaving gas amounts to approximately $1.20 per Mcf, the total cost of 32,120 Mcf of peak shaving gas is $38,544. Applicant's third year firm gas requirements are estimated to be 734,724 Mcf, and peak day requirements, 7078 Mcf. Without peak shaving, the total cost of this volume of gas purchased from Midwestern would be $571,609 annually ($54.60 per year per Mcf of demand and 25.2 cents commodity). If applicant's proposed peak shaving plant is used,[9] annual purchases from Midwestern would be 702,604 Mcf (734,724–32,120) and peak day purchases, 5472 (7078—1606) Mcf, at a total cost of $475,827 ($5472\times\$54.60+702,604\times25.2$). Adding the cost of applicant's peak shaving gas, $38,544, gives a total of $514,371 or an annual saving resulting from the use of the proposed peak shaving plant of $57,238 ($571,609—$514,371).

Minn-Dak alleges (Br. p. 30) that the consumer would pay 50 cents for 500 cubic feet of gas which costs applicant 60 cents to supply. Minn-Dak's conclusion

[8] Applicants purchase gas cost in this proceeding is based on a demand charge from Midwestern of $4.55 per Mcf and a commodity charge of 25.2 cents per Mcf (Exh. 53, p. 3). On December 30, 1964, 32 FPC 1548, the Commission approved a settlement in Docket No. RP61–19, *et al.*, under which the rate to be applicable to Great Plains will be $3.96 demand and 25.01 cents commodity, thus lowering Great Plains gas purchase costs.

[9] Peak shaving supplies 32,120 Mcf annually and 1606 Mcf of the estimated peak day volume.

that the rates to be charged by Great Plains for firm gas delivered during peak periods will not recover the costs properly allocated to such peak gas is without merit. Great Plains spreads such costs over its annual deliveries and block rates so that it may have a schedule of rates applicable uniformly throughout the year. This rate practice is common in the gas distribution industry and prevents unduly burdensome charges during any particular monthly billing period.

Minn-Dak's Legal Objections

Minn-Dak objects to approval of the Great Plains application on two specific legal grounds: (a) that Great Plains has not yet obtained the necessary local authority to distribute and sell gas in the Cities of Wahpeton and Breckenridge, and (b) that approval would violate the "no profits to affiliates" rule recently applied by the Commission in *Florida Gas Transmission Company*,[10] (Opinion No. 431, decided June 8, 1964, 31 FPC 1402, rehearing denied August 5, 1964, Opinion No. 431-A, 32 FPC 519).

The evidence indicates that Great Plains holds valid franchises to sell and distribute natural gas and to construct, operate, and maintain the necessary distribution facilities in the four communities to be served (Exh. 46). It has been authorized to transact business in the State of North Dakota conditional upon Federal Power Commission approval. This does not constitute a bar to certification under Section 7(a) of the Natural Gas Act.[11] Applicant will not be able to proceed without approval by North Dakota before commencing construction. (See *Central City, Kentucky*, 18 FPC 163 (1957)). The franchise secured from Breckenridge is limited in term to two years because that is the maximum limit which the City Council can grant without a general election.

Great Plains was organized by HD&R, which will receive a fee of 7 percent (about $187,000) of the total construction costs for engineering services and supervision. The record indicates that HD&R is a well established engineering firm with broad experience, a staff of about 275 engineers, architects, and other personnel, which organized Great Plains, proposes to do the engineering work, operate the system, and own at least 10 percent of the stock in the project (Tr. 404). There is no evidence that the project was organized and conceived solely or primarily for the purpose of providing profits for the promoters in excess of actual costs incurred in performing necessary engineering services incident to the organization and construction of the proposed distribution system. In order to assure consistency with the Commission's decision in the *Florida Gas Transmission* case, cited *supra*, Staff proposes the insertion of a condition in the Great Plains certificate providing that no part of the fee paid to the firm of HD&R for engineering services which exceeds the actual costs incurred in performing such services shall be included in Great Plains plant accounts. In order to eliminate any possibility of fees in excess of legitimate costs, Staff's proposed condition will be adopted. The Commission, clearly, has jurisdiction over the accounts of Great Plains under Section 8 of the Act and can regulate the propriety and amount of engineering fees to be included in

[10] Where the Commission ordered Florida Gas Transmission Co. to eliminate $8,187,110 from its plant accounts because that was the total of payments to affiliated engineering and construction companies in excess of actual costs. These payments, the Commission found, violated the "no profits to affiliates" rule which precludes allowing the profits of affiliates as an item of cost in the plant accounts or rate base. "The purpose of the rule is to prevent insiders taking advantage of their position and creating costs which are not subject to the check of ordinary business relationships." (p. 1408).

[11] See *East Tennessee Natural Gas Co.*, 11 FPC 426; *Tipton County Utilities Co. Inc.* (15 FPC 1362 (1956)).

the plant accounts. The absence of jurisdiction over Great Plains rates does not justify denial of the application as urged by Minn-Dak (Br. p. 16).

Staff proposes that Midwestern be directed to serve Great Plains in volumes not to exceed 5,472 Mcf in any one day and not to exceed 1,384,263 Mcf during any calendar year. The suggested limitation on the annual load factor is not in the public interest since Great Plains should be able to purchase at a higher annual load factor if justified by actual market demand and the availability of the gas for sale by Midwestern.

The North Star 7(a) Application

Wisconsin North Star, incorporated in July 1962, seeks to expand local natural-gas distribution, which commenced in August 1963,[12] from Dresser, Wisconsin to two new communities near the Midwestern line, the Villages of Boyceville (pop. 660) and Colfax (pop. 885). The project is estimated to cost $230,420 of which $36,620 is for transmission lines (3 miles of 2-inch line to Boyceville and 0.8 mile to Colfax from Midwestern's main line tap) and $193,800 for distribution systems (Exh. 67). Third year peak day requirements are 604 Mcf, 348 Mcf per day for Colfax and 256 Mcf per day for Boyceville. On October 27, 1964, the Public Service Commission of Wisconsin issued a certificate authorizing Wisconsin North Star to construct and operate the proposed facilities and to sell and distribute natural gas at retail in the Villages of Boyceville and Colfax.

Wisconsin North Star operates solely within the State of Wisconsin and is a wholly owned subsidiary of North Star Natural Gas Company, a Minnesota corporation.

Staff recommends that the proposed Wisconsin North Star project be denied on the ground that the record does not show that the project can be adequately financed or that it is economically feasible. Specifically, Staff objections focus on the alleged absence of an adequate market as indicated by the lack of population growth, the excessive estimate of meter saturation, and the risk of dependence upon two interruptible customers.

Boyceville has had a slow but steady increase in population (1930–1960) from 573 to 660, or aproximately 19 percent. Colfax had a similar growth pattern until June 1958, when a tornado destroyed approximately 45 percent of the town with a loss of 19 lives. However, the village has averaged five new homes a year since 1961 and its further growth is indicated by the construction of a new elementary school in 1963, a new church, an addition to the high school, and a new nursing home scheduled for construction in 1965 (Exh. 26, Tr. 332). North Star's president and treasurer, Mr. Carter, estimated on the basis of a house to house survey that in the third year of operation the meter saturation in the two villages would reach 70 percent of the ultimate potential. Based on the survey and recent experience in the operation of distribution facilities in Staples and Wadena, Minnesota and Dresser, Wisconsin, where meter saturation reached 83 percent after 16 months of operation, Wisconsin North Star's estimate of meter saturation in Boyceville and Colfax appears reasonable. The estimated rate of return in the third year is 10.4 percent, which, as noted by the Wisconsin Public Service Commission, allows some leeway along with contingencies in the estimate of meter saturation.

Staff is concerned with the project's dependence upon two interruptible customers (Colfax Cooperative Creamery Company and Boyceville Farmers Cooperative Creamery Association) whose sales ($76,750) comprise 41 percent of the project's total estimated revenues ($186,460) in the third year of operation. The economic feasibility of the proposed project depends on the estimated

[12] Pursuant to Commission authorization issued March 5, 1963, Docket No. CP63–44 (29 FPC 426).

revenues from these two customers. However, unlike the Great Plains application recommended for approval by the Staff, and numerous Section 7(a) applications approved by the Commission without customer contracts, applicant has submitted signed agreements with the two cooperatives providing for five year service (Exhs. 43, 44). Dependence upon interruptible sales is not in and of itself a basis for denying natural-gas service to new communities where the estimate of interruptible sales is reasonably conservative and adequate to justify the estimated revenues and rate of return. There is no evidence or reason to believe that these two customers will terminate or sharply curtail their use of natural gas at the end of the five year term. North Star's reply brief notes that the Boyceville Cooperative Creamery Association practically doubled its output capacity in 1964 and the Colfax Creamery has an expansion planned to start immediately upon the availability of natural gas. Moreover, we are mindful of the finding of the Public Service Commission of Wisconsin that the project as proposed "is conservatively estimated to be economically feasible."

The project cost of $240,000 is to be financed on the basis of $162,000 in first mortgage bonds maturing over a 20 year period with no payment on principal for the first five years, $18,000 in debentures maturing in 15 years with no payment on principal for the first three years, and the remaining $60,000 to be in common stock issued by Wisconsin North Star (Exh. 42). Mr. Carter computed the rate of return on the $240,000 investment as 4.8 percent for the first year of operation, increasing to 10.4 percent in the third year.

Staff emphasizes alleged inconsistencies and apparent contradictions in applicant's testimony regarding the purchase and ownership of Wisconsin North Star's common stock. The record is sufficiently clear, however, that the stock of Wisconsin North Star is wholly owned by North Star Natural Gas Company, the Minnesota Corporation, whose stock in turn is owned by Carleton Beh Co., John Gertz, and George Carter. Under the proposed plan of financing, the individual owners will pay $60,000 in cash for common stock in Minnesota North Star, the parent corporation. Minnesota North Star will receive common stock of the wholly owned subsidiary, Wisconsin North Star in exchange for the $60,000. This was the method used in financing Wisconsin North Star's service to Dresser, Wisconsin, previously approved by the Commission (29 FPC 426). North Star Wisconsin has already issued $106,000 par value common stock in connection with financing the gas system at Dresser, Wisconsin.

By amendment to its Articles of Incorporation dated September 28, 1964, North Star Wisconsin was authorized to increased its authorized capital stock to 500,000 shares at $1 per share common stock. Upon completion of the financing of the Boyceville and Colfax systems, the total capitalization and security ratios would be, as noted by the Public Service Commission of Wisconsin:

	Amount	Percent
Bonds	$162,000	47
Debentures	18,000	5
Common stock	166,000	48
Total	346,000	100

The Wisconsin Commission concludes that the security ratios are reasonable and meet the reasonable ratio provisions of Section 184.04(4) of the Wisconsin Statutes. The record, as supplemented by amendments to North Star's 7(a) application and documents attached to North Star's reply brief, supports the conclusion that the project proposed by Wisconsin North Star can be adequately financed and is economically feasible.

Staff Motion to Strike

On February 18, 1965 Staff moved to strike certain parts of North Star's reply brief on the ground that they were based on materials outside the record, principally documents attached to the reply brief as follows:

(1) Copy of letter dated February 9, 1965, from Joseph E. Casey, Vice President, Carleton D. Beh Co., Des Moines, Iowa to Mr. Lambert McAllister and Mr. Francis J. Walsh, Washington;

(2) Copy of letter dated December 14, 1964 from R. J. Allender, Vice President, Carleton D. Beh Co. to Mr. George Carter, c/o Walsh & McAllister, Washington;

(3) Copy of amendment to the Articles of Incorporation of North Star Natural Gas Company of Wisconsin, Inc., dated September 16, 1964, and copy of certificate of Secretary of State, State of Wisconsin, dated October 12, 1964.

These documents all relate to applicant's proposed financing and clarify the alleged inconsistencies described in Staff's brief. Staff concluded (p. 65) with the invitation that these inconsistencies "should be explained." The documents attached to applicant's reply brief are relevant and material and consist of copies of public documents and letters explaining facts which are elsewhere in evidence[18] and undisputed. Accordingly, Wisconsin North Star's reply brief will be deemed to include a motion to reopen the record for the purpose of admitting in evidence all of the documents attached to the reply brief and such motion will be granted for the reasons hereinabove indicated. The letter dated February 9, 1965 will be received in evidence as Exhibit No. 77, the letter dated December 14, 1964 was received in evidence as Exhibit No. 42 and the copy of the amendment to Wisconsin North Star's Article of Incorporation will be received in evidence as Exhibit No. 78.

Milwaukee Gas Light Company

Approval of Milwaukee's 7(a) application for an order directing Midwestern to connect its facilities with the proposed Milwaukee project is not disputed by any of the parties. The testimony presented by Milwaukee is uncontroverted and no party has intervened in opposition. Milwaukee will construct transmission and distribution facilities in the Cities of Neillsville, Greenwood, and Loyal in Clark County, Wisconsin and environs at a total estimated cost of $830,513, with anticipated third year revenues of $331,611, and an estimated third year rate of return of 5.89 percent. The Public Service Commission of Wisconsin has approved the proposed service and exclusive franchises have been obtained in each of the specified communities.

ADDITIONAL FINDINGS AND CONCLUSIONS

Upon consideration of the entire record in this proceeding including the pleadings, the evidence adduced, and the briefs filed, it has been found and concluded, in addition to the findings and conclusions heretofore stated, that:

(1) Each applicant is "a natural-gas company" within the meaning and purview of the Natural Gas Act.

(2) Applicants proposed facilities will be used in the transportation and sale of natural gas in interstate commerce for resale, subject to the jurisdiction of the Commission, and such facilities and the proposed sales of natural gas, as more fully described in the applications and record herein, are subject to the requirements of Section 7 of the Natural Gas Act.

(3) Subject to the requirements and conditions of this opinion and order, the construction and operation of the facilities and the sales of natural gas proposed

[18] The letter of December 14, 1964 is already in evidence as Exhibit No. 42.

by applicants are required by the public convenience and necessity, and applicants are able and willing properly to do the acts and to perform the services proposed, and to conform to the Natural Gas Act and the rules and requirements of the Commission pursuant to the law; and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) The conditions attached to the certificate herein issued are required by the public convenience and necessity.

(5) The ability of Midwestern to render adequate service to its customers will not be impaired and no undue burden will be placed upon it by reason of the sales, service, facilities, or requirements herein ordered.

ORDER

WHEREFORE, *It Is Ordered*, subject to review by the Commission on appeal or upon its own motion, as provided by its Rules of Practice and Procedure, that:

(A) Certificates of public convenience and necessity are hereby issued to the applicants named in the caption of this decision, on the conditions set forth herein, authorizing the sale of natural gas in interstate commerce for resale for ultimate public consumption, and for the construction and operation of any facilities subject to the jurisdiction of the Commission necessary therefor, all as more fully described in the applications.

(B) Midwestern is authorized to sell maximum day volumes of natural gas to the following customers in the amounts stated:

Customer	Presently authorized peak day service	Date and volume of proposed peak day service			
		Date of authorization	Nov. 1, 1965	Nov. 1, 1966	Nov. 1, 1967
North Central Public Service Co.	350	425	475	525	575
North Star Natural Gas Co	1,200	1,200	1,200	1,720	1,980
Northern States Power Co	29,530	29,530	29,530	30,870	30,870
Perham, Minn. (Village of)	600	600	650	675	675

(C) Paragraph (M) of the orders issued to Midwestern under Docket No. G–18314, on October 31, 1959 (22 FPC 775, 803), is hereby amended to read as follows:

> (M) Midwestern is hereby authorized, subject to the conditions specified herein, to import from Canada into the United States a maximum of 222,360 Mcf of natural gas per day at a point of interconnection on the International Boundary near Emerson, Manitoba and Noyes, Minnesota.

(D) Midwestern Gas Transmission Company is hereby directed to establish and maintain physical connection of its transportation facilities with the facilities of Great Plains Natural Gas Co. at a point in Otter Tail County, Minnesota, and to construct, operate and maintain meter facilities at the point of connection at Midwestern's expense, and to sell and to deliver to Great Plains through said connection natural gas in volumes not to exceed 5,472 Mcf in any one day, as measured at a pressure of 14.73 pounds psia, for resale in Pelican Rapids, Fergus Falls, and Breckenridge, Minnesota, and Wahpeton, North Dakota, as described in this proceeding.

(E) Midwestern shall report promptly to the Commission in writing and under oath the dates of commencement and completion of construction by it and the date of commencement of service to Great Plains as ordered herein.

(F) Great Plains shall report promptly to the Commission in writing and under oath the dates of commencement and completion of construction by it and the date of commencement of operation of its facilities as ordered herein.

(G) As conditions to the exercise of any right under the certificate issued to Great Plains herein, and prior to the exercise of any such right, there shall be compliance with the following conditions:

1. Great Plains shall file with the Commission under oath and serve on each of the parties to this proceeding and obtain the Commission's approval of:

(a) A financing plan which shall correspond to the financing plan presented to the Securities and Exchange Commission; and also

(b) A statement under oath regarding the present outstanding stock of Great Plains showing, among other things, the type, terms and conditions of such stock, the number of shares issued, when and to whom issued, the present owners, the valuation placed thereon at the time of issue, and the consideration for which they were issued.

(c) Great Plains shall file with the Commission acceptable contracts on precedent agreements with prospective purchasers of interruptible gas service providing for the purchase of at least one-half of the planned sale of 610,841 Mcf per year by the second full year of operation.

2. No part of the fee paid to the firm of HD&R for engineering services which exceeds the actual costs incurred in performing such services shall be included in Great Plains plant accounts.

(H) Midwestern is hereby directed to connect its facilities with those of North Star of Wisconsin and to sell and deliver to North Star of Wisconsin an additional 604 Mcf per day for distribution and sale in Colfax and Boyceville, Wisconsin, as described in this proceeding.

(I) Midwestern is hereby directed to connect its facilities with those of Milwaukee Gas Light Co. and to sell and deliver to Milwaukee Gas an additional 1385 Mcf per day for distribution and sale in the Cities of Neillsville, Greenwood, and Loyal in Clark County, Wisconsin and environs, as described in this proceeding.

(J) Upon final execution, Midwestern shall file promptly with the Commission a copy of the amendment to its gas purchase contract with Trans-Canada.

WILLIAM C. LEVY,
Presiding Examiner.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

THE NORTHERN ELECTRIC COOPERATIVE, INC., DOCKET NO. E-6670

ORDER AUTHORIZING TRANSMISSION OF ELECTRIC ENERGY TO CANADA AND SUPERSEDING PREVIOUS AUTHORIZATION

(Issued August 10, 1965)

The Northern Electric Cooperative (Northern), a corporation organized and existing under the laws of the State of Montana, with its principal place of business at Opheim, Montana, filed an application on February 8, 1965, as supplemented on June 10, 1965, for a supplemental order, pursuant to Section 202 (e) of the Federal Power Act, authorizing an increase in the amounts of electric energy which Northern is presently authorized to transmit from the United States to Canada.

By Commission order issued April 17, 1963 in the above docket (29 FPC 768), Northern was authorized to transmit electric energy from the United States to Canada at three points on the international border between the United States and Canada as follows:

Line No. 1: 20,000 kilowatt-hours per year at a rate of transmission not to exceed 20 kilowatts;

Line No. 2: 12,000 kilowatt-hours per year at a rate of transmission not to exceed 15 kilowatts; and

Line No. 3: 25,000 kilowatt-hours per year at a rate of transmission not to exceed 25 kilowatts.

Northern now seeks authorization to transmit electric energy from the United States to Canada in the following amounts and at the following rates of transmission:

Line No. 1: 24,000 kilowatt-hours per year at a rate not to exceed 24 kilowatts;

Line No. 2: 18,000 kilowatt-hours per year at a rate not to exceed 20 kilowatts; and

Line No. 3: 36,000 kilowatt-hours per year at a rate not to exceed 35 kilowatts.

The amounts of electric energy which Northern proposes to export like those amounts presently exported pursuant to the afore-mentioned authorization are to be transmitted to the Province of Saskatchewan, Canada, from points within the State of Montana over Northern's three 7.2 kv single phase lines which, as indicated above, are designated as Line No. 1, Line No. 2, and Line No. 3, respectively. These lines are covered by a Permit signed by the Chairman of the Federal Power Commission on December 12, 1956, as modified by the above-mentioned April 17, 1963 order of the Commission, all in the above docket.

According to the application, the increased amounts of electric energy will be used by Northern to meet the expanding electric requirements of its retail customers in Canada.

The Fort Peck Project of the United States Bureau of Reclamation will continue to be the source of the electric energy which is exported by Northern.

Written notice of the application has been given to the Board of Railroad Commissioners of Montana and to the Governor of that State. Notice of filing of the application has also been given by publication in the Federal Register on July 14, 1965 (30 F.R. 8867), stating that any person desiring to be heard or to make any protest with reference to the application should, on or before July 26, 1965, file with the Federal Power Commission, Washington, D.C., 20426, a petition or protest. No petition or protest or request to be heard in opposition to the granting of the application has been received.

The Commission finds:

(1) The transmission of electric energy from the United States to Canada, as limited herein and as hereinafter authorized, will not impair the sufficiency of electric supply within the United States and will not impede or tend to impede the coordination in the public interest of facilities subject to the jurisdiction of the Commission.

(2) The period of public notice given in this matter is reasonable.

The Commission orders:

(A) Northern is hereby authorized to transmit electric energy from the United States to Canada in accordance with the terms and conditions set forth in the application and subject to the provisions of this order.

(B) The electric energy which Northern is hereby authorized to transmit from the United States to Canada shall be in the maximum amount of 24,000 kilowatt-hours per year at a transmission rate not to exceed 24 kilowatts for

Line No. 1, the maximum amount of 18,000 kilowatt-hours per year at a transmission rate not to exceed 20 kilowatts for Line No. 2, and the maximum amount of 36,000 kilowatt-hours per year at a transmission rate not to exceed 35 kilowatts for Line No. 3. The energy which Northern is hereby authorized to export shall be transmitted over the facilities specified in the Permit signed by the Chairman of the Federal Power Commission on December 12, 1956, as modified by Commission order issued April 17, 1963, as referred to above.

(C) The authorization herein granted may be modified from time to time or terminated by further order of the Commission, but in no event shall such authorization extend beyond the date of termination or expiration of the Permit signed by the Chairman of the Federal Power Commission, referred to in Paragraph (B) above.

(D) Northern shall conduct all operations pursuant to the authorization herein granted in accordance with the provisions of the Federal Power Act and pertinent rules and regulations or orders issued by the Commission.

(E) Northern shall install and maintain adequate metering equipment to measure the flow of all electric energy transmitted from the United States to Canada over each of the afore-described three lines pursuant to the authority herein granted; shall make, keep, and preserve full and complete records with respect to the movement of such energy; and shall furnish in triplicate to the Commission, with respect to such transmission of energy, reports annually on or before February 15 showing (with respect to each of the afore-described three lines) the total kilowatt-hours delivered, the maximum kilowatts of transmission, and the consideration received therefor during each month of the preceding calendar year.

(F) This authorization to transmit electric energy from the United States to Canada shall not be transferable or assignable, but in the event of the involuntary transfer of facilities used for such transmission by operation of law (including such transfers to receivers, trustees, or purchasers under foreclosure or judicial sale), shall continue in effect temporarily for a reasonable time thereafter, pending the making of an application for permanent authorization and decision thereon, provided notice is promptly given in writing to the Commission accompanied by a statement that the physical facts relating to sufficiency of supply, rates, and nature of use remain substantially the same as before the transfer.

(G) This authorization shall be without prejudice to the authority of any State or State regulatory commission for the exercise of any lawful authority vested in the State or State regulatory commission over Northern.

(H) This authorization is without prejudice to the authority of this Commission, or any other regulatory body, with respect to rates, service, accounts, valuation, estimates or determinations of cost, or any other matter whatsoever now pending or which may come before this Commission or other regulatory body, and nothing herein shall be construed as an acquiescence by this Commission in any estimate or determination of cost or any valuation of property claimed or asserted.

(I) The authorization herein granted shall supersede that heretofore granted by Commission order issued April 17, 1963, referred to above.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

NORTHERN NATURAL GAS COMPANY, CP65–1, CP65–91, CP65–338; NATURAL GAS PIPELINE COMPANY OF AMERICA, CP65–169, CP65–325; TRANSWESTERN PIPELINE COMPANY, CP65–208, CP65–236, CP65–237, CP65–320

ORDER RESCINDING ORDER GRANTING TEMPORARY CERTIFICATES TO NATURAL GAS PIPELINE COMPANY OF AMERICA AND TRANSWESTERN PIPELINE COMPANY, AND GRANTING NEW TEMPORARY CERTIFICATE TO NATURAL

(Issued August 10, 1965)

On July 23, 1965, 34 FPC 110, the Commission issued an order granting temporary certificates of public convenience and necessity to Natural Gas Pipeline Company of America (Natural) and Transwestern Pipeline Company (Transwestern), authorizing them to construct and operate facilities and to exchange, transport, and sell natural gas in interstate commerce for resale as described in their respective applications under docket Nos. CP65–320, CP65–325, and a portion of CP65–169 comprising Phase 1 of the consolidated proceedings in the above-entitled cases.

The order granting the temporary certificates stated in part:

(E) The temporary certificates issued to Natural and Transwestern by this order are subject to further conditions, as follows:

* * * * * * *

(5) The certificates issued herein shall be void unless they are accepted in writing by both Natural and Transwestern within seven days after the date of this order.

On July 27, 1965, Natural filed an unconditional acceptance in writing of the temporary certificate issued to it by the Commission's order of July 23, 1965.

Transwestern, however, did not file an acceptance as contemplated by the Commission's order but instead, in a letter dated July 30, 1965, it attached a reservation to its acceptance as follows:

> * * * To avoid delaying Natural's project with respect to its Louisiana, mainline and storage facilities, Transwestern accepts the certificate issued it by such order with the express understanding and reservation that by such acceptance it does not obligate itself nor does it propose to install the facilities authorized prior to final Commission decision in Phase 1.

The Commission finds, therefore, that the said condition on which the temporary certificates were issued to Natural and Transwestern was not fulfilled and that, therefore, the temporary certificates which were granted to both Natural and Transwestern should be rescinded.

In its application for the temporary certificate Natural alleged, and submitted supporting evidence, that the additional volumes of gas which it proposes to sell and deliver will be needed by its customers during the winter of 1965–66 in order to avoid serious shortages of gas which would require curtailment of firm service. Natural further alleges that it must commence construction by August 1, 1965, if the proposed facilities are to be put in operation in time for the 1965–66 winter heating season. Lastly, that the temporary certificate requested by it is needed in order to assure maintenance of adequate service in Natural's market areas.

The Commission finds, therefore, that the public convenience and necessity require that Natural be granted a temporary certificate authorizing the construction of all of the facilities which Natural was authorized to construct by the Com-

mission's order issued July 23, 1965, granting it a temporary certificate and to operate the additional storage withdrawal facilities, *except* facilities which would be used to transport gas which Natural will purchase from producers in the Indian Basin and Dagger Draw areas in Eddy County, New Mexico to a point of connection with Transwestern's 24-inch West Texas lateral and to effect an exchange of such gas with Transwestern.

The Commission finds further:

(1) The Natural Gas Pipeline Company of America, a Delaware corporation having its principal office in Chicago, is engaged in the transportation of natural gas in interstate commerce and the sale in interstate commerce of natural gas for resale and it is a "natural-gas company" as defined in the Natural Gas Act.

(2) The facilities for which Natural is granted a temporary certificate of public convenience and necessity to construct and operate will be used for the transportation and sale for resale of natural gas in interstate commerce subject to the jurisdiction of the Commission, and the construction and operation thereof will be subject to the requirements of Section 7(c) of the Natural Gas Act.

(3) Natural is able and willing to do the acts and perform the services proposed in its application for a temporary certificate and to conform to the provisions of the Natural Gas Act and the rules and regulations of the Commission thereunder.

(4) The temporary certificate granted to Natural is needed in order to assure maintenance of adequate service to Natural's present customers.

(5) Public convenience and necessity require that the temporary certificate issued hereinafter and the rights granted therein be conditioned as hereinafter provided.

The Commission orders:

(A) The temporary certificates issued on July 23, 1965, to Natural and Transwestern are rescinded.

(B) A temporary certificate of public convenience and necessity is issued to Natural Gas Pipeline Company of America authorizing it:

1. To construct and operate facilities to increase its storage withdrawal capacity by 50,000 Mcf per day to a total capacity of 1,000,000 Mcf per day;

2. To construct, but not operate, facilities to increase the daily design sales capacity of its transmission system by 185,000 Mcf to a total of 2,154,000 Mcf;

3. To construct, but not operate, facilities to transport natural gas to be produced from reserves located in the West Cameron Blocks 17–49 Field Area, south Louisiana, to a point of connection with Natural's existing Gulf Coast line in Montgomery County, Texas;

all as described in Natural's applications under Docket Nos. CP65–325 and CP65–169 and in Phase 1 hearing exhibit 71.

(C) The certificate issued by this order and the exercise of the rights granted therein are conditioned upon compliance by Natural with all applicable Regulations of the Commission under the Natural Gas Act, and particularly Section 157.20 of said Regulations.

(D) The certificate issued by this order and the exercise of any right thereunder are subject to the further condition that in the event the Commission's decision in Phase 1 or Phase 2 of the hearing, which will be held in the future in these consolidated proceedings, results in any of the temporarily-authorized facilities which are constructed by Natural not being permanently certificated, the cost of such facilities will be excluded from Natural's rate base.

(E) The certificate issued to Natural by this order and the exercise of any right thereunder are subject to the further condition that the cost of facilities

constructed by Natural to enable it to take gas produced in the West Cameron Blocks 17–49 Field Area, south Louisiana, which is to be purchased from The California Company, will not be included in Natural's rate base until after an FPC certificate authorizing the sale of such gas has been issued to, and accepted by The California Company, which has a contract for the sale of such gas to Natural.

(F) The certificate issued herein shall be void unless it is accepted in writing by Natural within seven days after the date of this order.

OPINION NO. 470

PHILLIPS PETROLEUM COMPANY, DOCKET NOS. G–16611, G–16612; KERR-MCGEE OIL INDUSTRIES, INC., DOCKET NOS. G–16718, G–16719; THE JUPITER CORPORATION, DOCKET NO. G–16679

OPINION AND ORDER ISSUING CERTIFICATES

(Issued August 11, 1965)*

Syllabus

1. Producers' sales to Jupiter as of November 5, 1958 [non-jurisdictional prior thereto], should be considered initial sales and usual in-line pricing concepts should be applied. P. 488.
2. Commission *rejects* argument that Rollover Field sales be treated as made directly to pipeline, ignoring intervening sales to Jupiter and subsequently by it to pipeline. P. 488.
3. In *Union Texas* in-line price prior to 1963 was fixed at 18.5 cents per Mcf for offshore gas and 20 cents per Mcf for onshore gas—those prices should be applied to instant sales by Phillips and Kerr-McGee from Rollover and Hog Bayou Fields. P. 489.
4. Under its contracts with producers and pipeline, Jupiter would be entitled to no more than 2.4 cents above price producers may lawfully collect from it. P. 489.
5. Jupiter's temporary authorization amended to provide that as of date suppliers' 18.5 cents permanent certificate rates become effective, Jupiter's price for sale to pipeline shall be 20.9 cents. P. 489.
6. In determining the status in 1965 of transportation arrangement which ceased in 1958, circumstances of sale placed in proper historical context dictate solution without need for determining application of *Lo-Vaca*. P. 489.
7. Even were sale to Niagara jurisdictional under *Lo-Vaca*, Commission would not require that everything done pursuant to contrary official advice be undone—sales having terminated in 1958, prospective compliance with *Lo-Vaca* would be meaningless. P. 490.
8. In a proceeding under Section 7 of the Natural Gas Act, Commission *issues* certificates of public convenience and necessity; *amends* temporary authorization of Jupiter Corporation and *defers* decision on its application for permanent certificate.

*Initial decision appears on p. 491. Rehearing denied by order issued October 8, 1965, 34 FPC 1124.

William Brackett for The Jupiter Corporation.
Morton Simons for Long Island Lighting Company.
David B. Ward for Staff of the Federal Power Commission.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

SWIDLER, *Chairman:*

These proceedings are before us after being severed from the certificate proceedings in *Union Texas Petroleum, et al.*, Docket No. G–13221, *et al.*, Opinion No. 436, issued July 23, 1964, 32 FPC 254, wherein we determined the in-line price for sales from Southern Louisiana. The reason for severing these proceedings arose from a contention made in its exceptions by Long Island Lighting Company (Lilco) as to the date on which jurisdiction attached to these sales and, therefore, the proper initial contract price.[1]

Phillips Petroleum Company (Phillips) and Kerr-McGee Oil Industries, Inc. (Kerr-McGee) sold federal domain gas from the Rollover Field off the shore of Louisiana and from the Hog Bayou Field, also off the shore of Louisiana, but within the state's jurisdiction. The contract for the Rollover sales was dated in February 1953, and provided that Phillips and Kerr-McGee would sell gas for 14 cents per Mcf to The Jupiter Corporation (Jupiter) which in turn would transport the gas ashore, process it and sell it for 16.4 cents to Niagara Gas Transmission, Limited (Niagara) for export to Canada. In practice Jupiter delivered the gas onshore to Tennessee Gas Transmission Company (TGT) which transported the gas to the Canadian border and delivered it to Niagara near Buffalo, New York.

The gas produced in the Hog Bayou Field was sold by Phillips and Kerr-McGee directly to Niagara and delivered by the producers to TGT for transportation under the same terms as the Rollover gas. Since all of the gas purchased by Niagara was delivered into TGT's main transmission line, it was commingled with gas destined for resale by TGT to its domestic customers and the deliveries to Niagara were not the same gas but equal volumes.

TGT was certificated to transport the gas for Niagara by the Commission's Opinion No. 261, 12 FPC 311, wherein the Commission found after a contested proceeding that the sale of this gas in foreign commerce would not adversely affect domestic consumers.

Niagara was not in a position to take the gas in 1953. While waiting for Niagara to ready itself to take the gas from these fields, Phillips, Kerr-McGee, and a predecessor of Jupiter, Marine Gathering Company, made interim sales to TGT at prices from 3.8 cents to 9.3 cents per Mcf. Following the Supreme Court decision in *Wisconsin* v. *Phillips Petroleum Company*, 347 U.S. 642, the producers, including Jupiter's predecessor, applied for certificates for these interim sales to TGT. When Niagara was ready to receive the gas, the producers, again including Jupiter's predecessor, now Commonwealth Oil Co., applied to withdraw the applications for the sales to TGT. In replying to Phillips' Notice of Withdrawal, the Secretary of the Commission by letter dated June 20, 1958, stated:

"* * * inasmuch as the sale of gas covered by your related FPC Gas Rate Schedule No. 181 no longer constitutes a sale of natural gas for resale in interstate commerce subject to the jurisdiction of this Commission, but is a sale for resale to Niagara Gas Transmission, Limited, for exportation into the Dominion of Canada, said rate schedule, as supplemented, is also, considered withdrawn."

[1] One of the applicants, Jupiter Corporation, has subsequently injected into the proceedings the question whether its application in Docket No. G–16679 to sell gas to Tennessee Gas Transmission Company involved a jurisdictional sale or a non-jurisdictional gathering function for offshore producers who sell the gas to the pipeline.

A similar letter was sent to Kerr-McGee. By order issued July 25, 1958, in Docket No. G–2692, Jupiter's predecessor was permitted to abandon the sale to TGT and withdraw an application filed for the sale to Niagara on the ground that it was non-jurisdictional. Thereafter the parties regarded the sale to Niagara as not subject to Commission jurisdiction.

On September 22, 1958, as provided in the contract between the sellers and Niagara, and as agreed to by TGT, the price to Niagara was raised to 21.3333 cents plus tax reimbursement, effective November 1, 1958. On November 5, 1958, the contracts were assigned by Niagara to TGT because Niagara now was able to obtain gas from Canadian sources. The selling parties, including Jupiter's predecessor, Commonwealth Oil Company, applied for certificates for these sales at the redetermined price. Hearings on the new applications were held in 1959 and in his decision issued on June 17, 1960, Presiding Examiner Samuel Binder ruled that the applicable price line for these sales was 16.4 cents and that contrary to the contention of Lilco the sales were not jurisdictional prior to November 5, 1958, (*infra*, p. 491, at 494). Only the producers excepted to this decision. Instead of deciding the case, the Commission consolidated the dockets with the Southern Louisiana area rate proceeding, Docket No. AR61–2. Later the dockets were severed from this proceeding and consolidated in the *Union Texas* proceeding. In the *Union Texas* proceeding Examiner Robert Weston in his decision issued January 14, 1964 (32 FPC 279, at 309–311) found an in-line price of 20 cents for the Hog Bayou sales, an in-line price of 20.9 cents for the Jupiter sales to TGT, and an in-line, offshore, price of 18.5 cents for the Phillips and Kerr-McGee sales to Jupiter.[3]

The issue which caused us to sever these dockets once more, 32 FPC 270–273 was the renewal by Lilco of its argument made to Examiner Binder, but not to Examiner Weston, that the sales to Niagara were subject to Commission jurisdiction and hence that any increase in the price for these sales required a filing under Section 4 of the Natural Gas Act and could not be considered an initial price for a sale to TGT. In support of its argument Lilco cites the Commission decision in *Lo-Vaca Gathering Company*, 26 FPC 606 affirmed *sub nom. California* v. *Lo-Vaca Gathering Company*, 379 U.S. 366, reversing 323 F. 2d 190 (CA5–1963.)

Based on the record made in these proceedings, the history of the sales by Phillips, Kerr-McGee, and Jupiter, the examiners' decisions, the various briefs and the oral argument heard on February 26, 1965, we are of the opinion that the applications by the producers to sell to Jupiter as of November 5, 1958, should be considered as initial sales and that the usual in-line pricing concepts should be applied to the sales. We reject the argument made for the first time by Jupiter in the remanded proceeding that we should treat the sales from the Rollover Field as made directly by Phillips and Kerr-McGee to TGT and ignore the intervening sales to Jupiter and subsequently by it to TGT. Nothing in the record now before us justifies any such determination.

We are aware that Jupiter is contending in the pending Section 5(a) proceeding in Docket No. RI63–212, *et al.* that with respect to these sales, among others, it should be treated as performing only a non-jurisdictional gathering function so that its price for transporting the gas from the Rollover Field to TGT's onshore facilities would not be subject to our ratemaking jurisdiction either as a sale or as jurisdictional transportation. We do not believe we need to await the resolution of this question to pass upon the price at which Phillips and Kerr-McGee are entitled to be certificated for their Rollover sales since in any event they can secure only the in-line price for the gas sold from the federal domain as limited by their contractual rights.

[3] As used herein, "offshore" indicates acreage located in the federal domain and "onshore" indicates acreage located within the Louisiana tax jurisdiction.

The in-line price prior to 1963 was determined in the *Union Texas* proceeding to be 18.5 cents per Mcf for offshore gas and 20 cents per Mcf for onshore gas and these prices should be applied to the sales by Phillips and Kerr-McGee from the Rollover Field and the Hog Bayou Field. The underlying basis for these prices is fully discussed in the Union Texas opinion and there is no need to repeat that discussion. Thus, we shall authorize Phillips and Kerr-McGee to receive 18.5 cents for their Rollover sales to Jupiter. Refunds due for any excessive charges collected since 1958 for these sales by the producers will be determined on the same basis as for the other producers in the *Union Texas* case to which the doctrine announced in *P.S.C. of New York* v. *F.P.C.*, 329 F. 2d 242 (CADC–1962) cert. den. 377 U.S. 963, will be applicable.

We cannot take final action on Jupiter's application because of the unresolved jurisdictional question. This does not mean, however, that we must continue in force a temporary certificate under which Jupiter is authorized to collect 22.8333 cents. Assuming *arguendo* that Jupiter is correct in claiming that its transportation activities are non-jurisdictional it is clear that under its contracts with the producers and TGT it would be entitled to no more than 2.4 cents above the price which the producers may lawfully collect from it. Assuming Jupiter's operations are jurisdictional, either as sales or transportation, the maximum price for which there is any justification on this record is also 2.4 cents. It is far from clear that if we were writing on a clean slate we could find on this record that certificating Jupiter's "sale" to TGT at a price of 2.4 cents above the in-line price for offshore gas was in the public interest. Here there are many complicating circumstances. In view of the long history of this sale, the pendency of a jurisdictional question in a different proceeding with respect thereto, and that in the near future in that proceeding we can fix the just and reasonable rate for such operations, assuming we find Jupiter to be jurisdictional, we would not be inclined to disagree with the examiner in fixing a 20.9 cent initial price for this "sale" despite the bareness of record support therefor.

Accordingly, we shall amend the outstanding temporary under which TGT is purchasing gas from Jupiter to provide that as of the date on which the 18.5 cents permanent certificate rates become effective for Phillips and Kerr-McGee the price for the "sale" by Jupiter to TGT shall be 20.9 cents. Such an amendment will fully protect Jupiter's rights in the 5(a) proceeding while at the same time obviating any claim that because of filed rate concepts TGT is required to pay and Jupiter is entitled to collect a price which would give it more than 2.4 cents in the light of what it would now be obligated to pay to Phillips and Kerr-McGee.

We now take up Lilco's contention. The physical characteristics of the transportation for Niagara by TGT conform with the commingling theory of the *Lo-Vaca* case in that the gas delivered to TGT in Southern Louisiana was not the same gas delivered to Niagara near Buffalo.

If this sale were now before us for the first time it would be necessary to determine whether *Lo-Vaca* controlled. However, we conclude that in determining the status in 1965 of an arrangement which ceased in 1958 the circumstances of the sale placed in a proper historical context dictate the solution without need for determining the application of those two cases.

The contract was originally written in 1953 when none of the parties believed the sale to be jurisdictional no matter how it was drafted. During the period after June 7, 1954, when the gas was sold to TGT, the producers obtained temporary certificates and filed the rates. When the interim sale to TGT was terminated the producers were advised by an official communication from the FPC (the Secretary's letter of June 20, 1958) that the sales were no longer juris-

dictional. Presumably this letter reflected the belief of the Commission at that time[2] and no one took issue with it. In the interest of orderly administration we cannot now hold that such an interpretation has no relevance. There may be situations in which the public interest will require retroactive application of Commission reinterpretations of the statute, thereby depriving a party of rights which he could have exercised if he had not accepted the initial interpretation. This does not seem to be such a case. We should be loath to disturb arrangements presented to and approved by us, and accepted by all parties in good faith.

The rates for the sale of this gas were filed with us in 1954. When we were advised that the sales were to be made to a new purchaser we did not order a supplemental filing. With complete knowledge of the circumstances of the change we accepted withdrawal of the certificate applications and removed the rate schedules from our files. We thus rendered it impossible to file changes in the rates prior to November 5, 1958. Had we advised the producers in good time that the sales to Niagara were jurisdictional and retained the filings, the producers undoubtedly would have filed the changes to validate the rate which came before us in the application filed November 5, 1958.

Even if we were to find that the sale to Niagara was jurisdictional under the *Lo-Vaca* holding we would not require that everything done pursuant to contrary official advice be undone.[3] We would, of course, require prospective compliance. The sales having terminated in 1958, such a prospective requirement would be meaningless.

The Commission finds:

Finding paragraphs 1 through 7 of Opinion No. 436, *Union Texas Petroleum*, issued July 23, 1964, 32 FPC 254, 271–272 are applicable to the applicants, Phillips and Kerr-McGee, in Docket Nos. G–16611, G–16612, G–16718, and G–16719.

The Commission orders:

(A) Permanent certificates are hereby issued to Phillips and Kerr-McGee effective July 23, 1964, subject to the conditions set forth below, to authorize the sales and services as proposed in the above dockets and as more fully described in the respective applications.

(B) The initial price in the rate schedules applicable to the sales certificated in paragraph (A) shall not be more than 18.5 cents per Mcf for the sales to Jupiter from the Rollover Field and 20 cents per Mcf for the sales to TGT from the Hog Bayou Field.

(C) Phillips and Kerr-McGee shall refund to the purchasers all amounts collected since July 23, 1964, in excess of the prices set forth in paragraph (B), together with 7 percent interest to the date on which the refunds are made. Any refunds which may be due for the period from November 5, 1958, to July 23, 1964, will be determined in the manner set forth in ordering paragraph (C) of Opinion No. 436 and the parties to this proceeding may make filings as provided in that opinion.

(D) A decision on the application for a permanent certificate by Jupiter in Docket No. G–16679 is hereby deferred until the record in Docket No. RI63–212 comes before the Commission. The temporary certificate issued to Jupiter on May 24, 1962, is amended to add a condition that: "As of July 23, 1964, the price provided in the rate schedules covering the sale to TGT of the gas obtained from Phillips and Kerr-McGee shall not exceed 20.9 cents per Mcf."

Commissioner Bagge *not participating.*

---

[2] Examiner Binder so held and no exception was taken to his holding.

[3] Order No. 174, 13 FPC 1195; *Linkletter* v. *Walker*, 381 U.S. 618 (June 7, 1965) 33 L.W. 4576.

INITIAL DECISION
OF THE PRESIDING EXAMINER UPON APPLICATION FOR CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY

(Issued June 17, 1960)

BINDER, *Presiding Examiner:*

These proceedings involve five applications for certificates of public convenience and necessity filed pursuant to Section 7(c) of the Natural Gas Act (Act) by the three applicants named in the caption. The material facts are as follows: Phillips Petroleum Company (Phillips) as Operator, and Kerr-McGee Oil Industries, Inc. (Kerr-McGee) a signatory party, own 50 percent interest each in leases covering described acreage in Rollover and Hog Bayou Fields, offshore Louisiana, from which the gas involved here is produced and each producer has filed applications (1) seeking authority to sell natural gas produced in Rollover Field for resale in interstate commerce to Commonwealth Oil Company (Commonwealth) and (2) applications to sell natural gas produced in Hog Bayou Field to Tennessee Gas Transmission Company (Tennessee) for resale in interstate commerce. A major part of the gas involved in these proceedings is produced in Rollover Field, offshore Louisiana. The gas produced in Rollover Field is sold to Commonwealth and resold by the latter to Tennessee, which resells it in interstate commerce. Commonwealth filed an application pursuant to Section 7(c) of the Act seeking authority to resell to Tennessee the natural gas produced in Rollover Field which it purchases from the independent producers. Commonwealth is not, insofar as these proceedings are concerned, a producer of natural gas but rather is a gatherer, transporter and purchaser of natural gas from the Rollover Field, and is a seller of such gas to Tennessee. Commonwealth transports the natural gas from a platform in Rollover Field to a point of connection with the facilities of Tennessee, a distance of approximately ten miles.

The Hog Bayou gas is gathered and delivered to Tennessee's facilities directly by the producers.

It will be observed that Tennessee acquires all of the gas involved in these proceedings and that the price to it is 21.3333 cents per Mcf, plus tax reimbursement for all of the gas whether it comes from Hog Bayou or Rollover Fields. Insofar as the Hog Bayou sale is concerned, Tennessee pays 21.3333 cents per Mcf plus tax reimbursement directly to the producers for the gas. Insofar as Rollover Field gas is concerned, Commonwealth resells such gas to Tennessee at a price of 21.3333 cents per Mcf plus tax reimbursement and Commonwealth is permitted under its contractual arrangements to keep for itself only a limited amount of the proceeds which it receives from Tennessee. In this instance, based upon the volumes delivered, it is 2.4 cents per Mcf which is the same amount per Mcf as it would obtain were the price 16.4 cents per Mcf plus tax reimbursement, which it was for approximately five years prior to November 1, 1958.

It is obvious that Commonwealth's revenues are limited to specified and definite amounts for the services it performs and its retained revenues, insofar as these proceedings are concerned, bear no relation to the price of the product it sells. In this respect Commonwealth is not an independent seller in the sense in which such terms normally are understood, *i.e.*, it is not a person who has the right to retain all the economic benefits of its contract of sale particularly when a rise in the product occurs, a right which accrues normally to an independent entrepreneur. Its economic rights and the revenue which it is entitled to retain

are strictly limited under the contracts which it has executed to a specific amount dependent not on the price at which it sells its gas but dependent solely on the volume it gathers and delivers. Thus neither its gross nor its net income, insofar as this case is concerned, is enhanced by the rise in rate level from 16.4 cents to 21.3333 cents per Mcf. This, of course, is a perfectly legitimate business arrangement and no criticism of it is intended by these comments. It is referred to here simply so that Commonwealth's position in this litigation may be fully understood.

At the volumes which it is contemplated will be delivered here Commonwealth will obtain 2.4 cents per Mcf for all gas which it gathers, transports and delivers to Tennessee and this is all that it will receive no matter what price Commonwealth receives from Tennessee. The balance of the purchase price goes to the independent producers. In these circumstances the price level in the contract between the producers and Commonwealth, insofar as its impact on consumers is concerned, is more illusory than real, and it is of little, if any, importance from a public standpoint as a component in the ultimate judgment to be made whether the issuance of a certificate would serve public convenience and necessity. From the standpoint of consumer impact the rate of 21.3333 cents per Mcf plus tax reimbursement which is paid by Tennessee for the gas it sells to the public in various states is the figure which is of importance in this case. The public impact will be felt at the 21.3333 cent rate level and not at the price in the contract between the producers and Commonwealth. The price which Tennessee will pay on the basis of the applications filed in these proceedings is, as has been noted, 21.3333 cents per Mcf at 15.025 psia plus tax reimbursement for each Mcf of gas involved in these proceedings whether sold to it by the producer or Commonwealth and that is the salient fact.

Three dockets, namely, Docket No. G–16611, Docket No. G–16718, and Docket No. G–16679, relate to the sale of natural gas produced from a single lease covering the S/2 of Block 39, Rollover Field, offshore Vermilion Parish, Louisiana. This is the gas which is sold to Commonwealth and resold by the latter to Tennessee for resale in interstate commerce. The other two dockets involved in these proceedings, namely, Docket No. G–16612 and Docket No. G–16719, relate to the sale of gas directly to Tennessee for resale in interstate commerce and is gas produced by Phillips, as Operator, and sold by it and Kerr-McGee as signatory parties from the leases in the Hog Bayou Field covering Blocks 32 and 33, West Cameron area, Louisiana. In the latter two dockets the independent producers do their own gathering and make delivery themselves to a point of connection with Tennessee's facilities.

The volumes of natural gas involved here are important. The Rollover leases controlled by applicants cover 2500 gross acres and their Hog Bayou leases cover 14,762 gross acres. Tennessee has estimated the reserves in Rollover and Hog Bayou Fields as 566,675,000 Mcf as of November 1, 1958, all of which under the agreements is dedicated to it. Under the contracts involved herein Tennessee is to take at this time gas at the rate of 60.7 million cubic feet of gas per day from Rollover and Hog Bayou Fields. The Hog Bayou contract provides that the daily amount to be taken from the latter field shall be equal to the excess of Tennessee's requirements over the average daily volume of gas available from Rollover Field received by it through Commonwealth.

In further specific detail the background facts regarding the sale from Rollover Field may be stated as follows: Phillips Petroleum and Kerr-McGee entered into a contract with a company called the Marine Gathering Company (Marine) on February 6, 1953, for the sale of the gas produced from the Rollover Field. Commonwealth Oil Company is the successor of Marine and for

the purposes of this decision Commonwealth and Marine are considered to be the same person. On the same day that the producers entered into the contract of sale with Marine the latter entered into a contract with a Canadian company, Niagara Gas Transmission Ltd., (Niagara) for the sale of the same gas which Marine was obtaining from the producers. In addition, an agreement was entered into with Tennessee Gas Transmission Company for the transportation of the gas at a point on shore in Louisiana where Marine's gathering facilities were located to a point at the international border for delivery to Niagara.

The transportation and exportation by Tennessee were authorized by a certificate of public convenience and necessity and an export permit to Tennessee was issued in Docket No. G–1921, *et al.*, in Opinion No. 261, on September 1, 1953, 12 FPC 311. The price provided for in the contract between the producers and Marine on February 6, 1953, was 16.4 cents per Mcf, less the amount obtained by Marine for gathering and getting the gas on shore to a point of connection with Tennessee's facilities, an amount which varied with the volume transported.

The contract between Marine and Niagara provided for the sale of the same gas to Niagara at the same price, *i.e.*, 16.4 cents to Niagara. Apparently Marine's economic interest in the transaction from the beginning to the present time is limited to what it obtains from the producers for the service it renders in picking up the gas at the offshore platform in the Rollover Field, transporting it through its facilities to the shore line and up to the point where the gas is delivered into Tennessee's facilities. The economic advantages to Commonwealth under the contract are the same no matter what price is obtained from the purchaser of gas from Commonwealth. In other words, even where the purchaser is required to pay more for the gas because of the operation of escalation clauses contained in the contracts, the entire additional amount obtained from the gas goes to the producers.

The escalation provisions in the contracts contain clauses for price redetermination every five years on the basis of the average of the three highest prices paid by pipelines in an area defined in the contract. The first step escalation took place November 1, 1958. As a result of the operation of this escalation clause the price of the gas which Commonwealth bought initially from Phillips and Kerr-McGee increased from 16.4 cents per Mcf plus taxes to 21.3333 cents per Mcf plus taxes.

There is no proof here that the producers incurred greater costs in producing the gas between 1953 and 1958, nor was there proof presented of any other basis on which increases in rates for natural gas companies are normally granted by the Commission. Accordingly there is no economic justification in this record for the increase in rate level other than such economic "justification" as is implicit in the concept of getting as much as the traffic will bear. The difficulty of the concept in this instance is that we are dealing with a commodity which the Supreme Court has held to be one which Congress has directed be regulated rather than with an unregulated commodity. The fact that field prices of gas increased in this area between 1953 and 1958 is not a ground of itself which entitles a producer to an increase in the rates he was receiving prior to the date when the increase in rates went into effect. The law requires more than this to establish that the issuance of a certificate at the increased rate would serve public convenience and necessity. Four days after the increase to 21.3333 cents per Mcf plus taxes went into effect, to wit, on November 5, 1958, Niagara ceased purchasing from Commonwealth and assigned its rights in the gas purchase contract to Tennessee.

The Hog Bayou Sale

The sale of gas from Hog Bayou is based on a contract entered into on the same day that the contract for the sale of gas from Rollover Field was executed. However, this transaction was a direct sale by the producers to Niagara without participation by Marine. Under the Hog Bayou contract, the independent producers employed their own gathering facilities. The Hog Bayou contract between the producers and Niagara carried the same original purchase price to Niagara as did the gas from Rollover, namely, 16.4 cents per Mcf plus taxes and Tennessee also transported this gas northwards for delivery to Niagara. On November 1, 1958, the operative provisions of the escalation clause in this contract which were the same as those in the Rollover contract went into effect and this resulted in the price of the gas to Niagara being increased from 16.4 cents per Mcf to 21.3333 cents per Mcf plus taxes. Just as in the case of Rollover gas Niagara ceased importation of the Hog Bayou gas and its rights were assigned to Tennessee on November 5, 1958, and Tennessee has been receiving the gas ever since such date.

Prior to the assignment to Tennessee the contracts were modified to provide that commencing May 1, 1957, and thereafter, Niagara would purchase annually an average of 60,700 Mcf per day from Rollover and Hog Bayou Fields and also provided that out of the latter amount 10,700 Mcf would be taken from Hog Bayou Field. Tennessee by reason of the assignment acquired the rights theretofore held by Niagara.

The position of the applicants is that the sale of gas from the two fields with which we are concerned here, when originally made, were sales not subject to the Natural Gas Act, since they did not involve sales in interstate commerce within the meaning of the Act, but rather were sales in foreign commerce and therefore not subject to the Act. It is therefore claimed by the applicants that the first sale in interstate commerce, *i.e.*, the initial sale, within the meaning of the Act took place at the time that the rights of Niagara to take gas were assigned to Tennessee, to wit, on November 5, 1958, and that consequently there was no obligation to institute a proceeding subject to Section 4(e) of the Act by reason of the increase in the rate level on November 1, 1958, from 16.4 cents per Mcf plus tax reimbursement to 21.3333 cents per Mcf plus tax reimbursement. This contention appears to be legally sound.[1]

While the contracts for the disposition of the gas by the producers were executed in February 1953, no deliveries could be made until November 1954. In fact, Niagara did not actually accept deliveries under the Hog Bayou contracts until June 1957. It appeared further that from June 1954 to November 1954 in the Rollover Field the producers sold gas to Tennessee for the latter's system requirements at 3.8 cents per Mcf, plus the gathering charge made by Marine. Later the price was increased to 8.3 cents. Subsequently, Hog Bayou gas was sold for 9.3 cents.

It was claimed by the applicants that these were "distress" sales. While this claim may be correct no evidence was presented on the point, nor was the extent of the "distress," if any, ever delineated on a "cost" or any other basis. Moreover, no evidence was presented by producers which tended to establish that a rate level of 21.3333 cents per Mcf would tend to serve public convenience and necessity more than a rate level of 16.4 cents per Mcf, the latter being the rate level just four days before the contract of sale was assigned to Tennessee and the "initial" rate established. Moreover there was no claim by applicants that the 16.4 cent level was a "distress" sale or that the sellers would not earn a just and reasonable return at this level or that it was an unjust and unreason-

[1] *Cf. Border Pipe Line Co.* v. *Federal Power Commission*, 171 F. 2d 149 (D.C. Cir. 1948).

able rate level. No evidence was presented to show that a rate level of 21.3333 cents per Mcf plus tax reimbursement would serve public convenience and necessity better than, or even as well as, a rate of 16.4 cents per Mcf plus tax reimbursement, the rate in effect prior to the operation of the escalation clause. Nor is there any evidence in the record which would show whether either the 16.4 cent plus sale tax reimbursement level or the 21.3333 cent plus tax reimbursement rate level is unjust or unreasonable or just and reasonable. In effect there is no cogent evidence in this proceeding relating to the justness or reasonableness of the rate level sought to be imposed or the justness or reasonableness of the 16.4 cent per Mcf rate level or vice versa.

It should be observed that the undersigned is not suggesting that the applicants should have undertaken a full rate case presentation. The only observation that the examiner makes in this connection is that there was wholly absent any basis justifying the price level at issue here. In this connection it should be observed that the burden of establishing that it would serve public convenience and necessity to issue a certificate at the 21.3333 cent per Mcf level is on the applicants and not on the staff or interveners. That burden was not met here any more than it was met in the *CATCO*[2] or *Transco* cases.[3]

Further the fact that gas prices in a particular area went up substantially in such area is no ground for authorizing a sale at the high level to producers who only four days before were selling gas from the same fields at very substantially lower levels. In fact the "initial" price here is more than 25 percent higher than the price at which the gas was sold in "foreign" commerce only four days before. In fact we have the anomalous situation of gas being sold in the "unregulated" market at 16.4 cents per Mcf, but where it enters the "regulated" market the price proposed is more than 25 percent higher than in the "unregulated" market only four days before.

The Staff and the interveners other than Tennessee object to the applications being granted unless the price is conditioned to a level to Tennessee no greater than 16.4 cents per Mcf plus tax reimbursement. As the price issue developed, no proof was developed that it would not serve public convenience and necessity if certificates were issued at the 16.4 cent price level. On the other hand, it was contended that the issuance of a certificate permitting the 21.3333 cent rate level would involve the issuance of a certificate at a level which was not established as comporting with the concept of public convenience and necessity as claimed by interveners and subsequently espoused in the *CATCO* case by the Supreme Court.

Of course, it was claimed by applicants that the issuance of a certificate at the 21.3333 cent rate level would serve public convenience and necessity but this claim was based on assertion rather than proof. The essential objection to unconditioned certification made by interveners and the Staff was that the evidence presented by applicants did not establish that it would serve public convenience and necessity to issue certificates at an increased rate level which was reached only after escalation provisions had been put into effect, *i.e.*, that there was a want of proof to establish the public convenience and necessity would be served by the issuance of the certificates at the higher level within the meaning of the *CATCO* case. Indeed, the evidence is entirely wanting on the basis of the Supreme Court's views as expressed in *CATCO* to establish that it would serve public convenience and necessity to issue certificates authorizing producers to obtain 21.3333 cents per Mcf for the gas being sold here. In fact the only basis claimed for issuing a certificate at this rate level was

[2] *Atlantic Refining Co., et al.* v. *P.S.C. of New York, et al.*, 360 U.S. 378.
[3] *Public Service Commission* v. *F.P.C.*, 361 U.S. 195.

that this figure represented an "initial" price, and others in the area were selling at this price when the escalation provisions became effective in 1958. There was no attempt other than this factually correct claim made to establish that the price level was such as would serve public convenience and necessity.

It may be urged that there was no evidence that 16.4 cents is a just and reasonable rate level. It is true that there was no evidence presented by applicants as to what a just and reasonable rate level for the gas involved here would be or as to what rate would hold the line of protection for consumers against rate levels which would not be in the public interest within the meaning of the Natural Gas Act. There was, of course, no burden on Staff or interveners to establish that any particular rate level would serve public convenience and necessity. Such burden rested solely on the applicants. This leaves the record in a state where the only rate level to which there is no serious objection is the 16.4 cent rate level, a rate agreed upon in the contract executed in 1953 and a rate which was in effect up to only four days before the new high rate was established. The contracts provided that the 16.4 cent rate was not to be changed unless the rate level in the area rose. It is true as applicants claim that gas is being sold at the price sought here and, in fact, contracts at somewhat higher prices have been executed but there has been no unreversed adjudication on the principles enunciated in *CATCO* on which a finding has been made that issuance of a certificate at this rate level in this area would serve public convenience and necessity.

The fact of the matter is that had the gas which was sold been sold in interstate commerce from the time the contract was executed until November 1958, it would have been necessary for applicants to institute a Section 4 proceeding to obtain the increase which went into effect as a result of the operation of the escalation clause and it would have been necessary to establish by material evidence that such rate was just and reasonable. The fact that the escalation clause went into operation and that thereby a higher rate went into effect on November 1, 1958, is no proof whatever that the difference between the 16.4 cent level and the 21.3 cent rate level is one which was justifiable on principle under the Natural Gas Act or was a rate which reasonably impelled a conclusion that the granting of the application at the higher rate would serve public convenience and necessity or that it would serve public convenience and necessity as well as the lower rate. The language of the Supreme Court in the *CATCO* case is enlightening on this particular point:

> * * * The purpose of the Natural Gas Act was to underwrite just and reasonable rates to the consumers of natural gas. *Federal Power Commission* v. *Hope Natural Gas Co.*, 320 U.S. 591, 88 L ed 333, 64 S Ct 281 (1944). As the original § 7(c) provided, it was "the intention of Congress that natural gas shall be sold in interstate commerce for resale for ultimate public consumption for domestic, commercial, industrial, or any other use at the lowest possible reasonable rate consistent with the maintenance of adequate service in the public interest." 52 Stat. 825.[7] The Act was so framed as to afford consumers a complete, permanent and effective bond of protection from excessive rates and charges. The heart of the Act is found in those provisions requiring initially that any "proposed service, sale, operation, construction, extension, or acquisition * * * will be required by the present or future public convenience and necessity," § 7(e), 15 USC § 717(f)(e), and that all rates and charges "made, demanded, or received" shall be "just and reason-

[7] The 1942 amendments to § 7, 56 Stat. 83 were not intended to change this declaration of purpose. See Hearings, House Interstate and Foreign Commerce Committee, on HR 5249, 77th Cong. 1st Sess 18–18; HR Rep No 1290, 77th Cong. 1st Sess; S Rep No. 948, 77th Cong. 2d Sess.

able," § 4, 15 USC § 717(c). The Act prohibits such movements unless and until the Commission issues a certificate of public convenience and necessity therefor, § 7(c), 15 USC § 717f(c). Section 7(e) vests in the Commission control over the conditions under which gas may be initially dedicated to interstate use. Moreover, once so dedicated there can be no withdrawal of that supply from continued interstate movement without Commission approval. The gas operator, although to this extent a captive subject to the jurisdiction of the Commission, is not without remedy to protect himself. He may, unless otherwise bound by contract, *United Gas Pipe Line Co.* v. *Mobile Gas Service Corp.*, 350 U.S. 332, 100 L ed 373, 76 S Ct 373 (1956), file new rate schedules with the Commission. This rate becomes effective upon its filing, subject to the 5-month suspension provision of § 4 and the posting of a bond, where required. This not only gives the natural gas company opportunity to increase its rates where justified but likewise guarantees that the consumer may recover refunds for moneys paid under excessive increases.

* * * * * * *

Moreover, the fact that the Commission was not given the power to suspend initial rates under § 7 makes it the more important, as the Commission itself says, that "this crucial sale should not be permanently certificated unless the rate level has been shown to be in the public interest." 17 FPC 563, 575; 360 U.S. 378, pp. 388, 389 and 390.

The Court was, of course, talking in the context of a proposed sale in the continental shelf area off the coast of Louisiana and the potential of this vast acreage of which the gas involved here is a part.

The instant proceeding is in a number of major aspects similar to the *CATCO* case. The Court's observations in *CATCO* are equally pertinent to the situation before the Examiner.

Experience under the Act shows that when a pipeline has to pay more for the gas it purchases it is required as a matter of ordinary business prudence to pass that increase on to the public unless it is making an excessive rate of return and can thus absorb an increase in its purchased gas costs without so doing. There is no indication in the evidence presented, nor is it even claimed in this proceeding, that Tennessee is making an excessive return on its rate base and therefore no such assumption could or will be made here. In these circumstances it is reasonable to assume that if and when Tennessee buys gas at prices which are at the level proposed here it will have to pass those higher gas costs on to the public which eventually consumes its gas.

The Supreme Court in *CATCO* speaking in the context of the consideration to be given the prices for gas in a certificate proceeding pointed out that the Act was not intended to "provide a windfall for the natural-gas company with a consequent squall for the consumers."

In the light of the *CATCO* and *Transco* cases it is imperative that protection must be afforded consumers against prices which are not justifiable as affording reasonable safeguards to consumers in certificate, as well as rate, cases and the Court's holding is to the effect that certificates of public convenience and necessity may not be issued where it has not been shown that the rate level at which the gas is to be sold is one which affords reasonable safeguards to consumers against excessive rates.

The evidence is that Niagara assigned its rights to Tennessee and there is no evidence that Tennessee conducted any arm's-length negotiations with anyone relating to the price of gas. When the assignment was made the price had escalated just four days before to 21.3333 cents per Mcf plus tax reimbursement and there is no evidence that the price was discussed on any basis but the inten-

tion implicit in the escalation clause which was to increase the price to producers if others sold at higher prices—a standard of price determination which is unrecognized in the regulatory process, and in fact is the negation of regulation and is contrary to the entire concept of "holding the line."

It would appear unreasonable, however, to assume that the transactions between the producers on the one hand, and Niagara on the other, or the transactions between Commonwealth and Niagara were eleemosynary in character. There is no evidence whatever of any affiliation between the buyer and the sellers of the gas. It would not be unreasonable, in the absence of evidence to the contrary, to assume that the negotiations between these parties were conducted at arm's-length and in good faith. Unfortunately, from the standpoint of the applicants herein, the fact that the transaction which took place may have taken place and most probably did take place at arm's-length is not in and of itself a basis upon which it can be assumed that the issuance of a certificate at the rate level reached by the parties by operation of escalation clauses would serve public convenience and necessity.

The New York Public Service Commission points out that there is no evidence in the record of "need" by Tennessee for this gas. In Commission order, issued January 28, 1959, 21 FPC 70, the Commission granted a certificate in Docket No. G–11107 authorizing a substantial increase in Tennessee's capacity and substantial additional sales to its customers, including customers in New York State. The gas reserves which are the subject of these proceedings were considered in that docket as part of Tennessee's total system supply and formed part of the basis for the Commission's authorizations to Tennessee in this docket. In addition, Tennessee presented a witness in this proceeding whose testimony was uncontradicted and whose testimony indicated a need for the gas supply proposed to be sold by the applicants.

There was not in this proceeding a full-scale presentation of Tennessee's total supply in relation to its requirements, and there are natural gas companies which have larger reserves in relation to their requirements than has Tennessee. However, this is not to say that Tennessee's reserves are inadequate but simply to point out that any claim that the dedication and sale of this gas to Tennessee would not serve public convenience and necessity would appear to be without basis. Ordinary prudence impels the management of large pipeline companies to replace gas which is consumed with new purchases and take additional steps where necessary to improve the relationship between reserves and requirements.

The principal issue in these proceedings is not whether the addition of this gas supply is necessary or desirable from the standpoint of the public interest but whether the public convenience and necessity would be served if the certificate authorizations sought here were granted in such manner as to permit these sales to be made at the escalated price, namely, 21.3333 cents per Mcf plus tax reimbursement, without proof that this level would serve public convenience and necessity.

Since the applicants have presented no proof that the consumers would be protected adequately within the meaning of the Act as interpreted in *CATCO* by a sale at this level, or that the consumers would be afforded protection at all, it does not appear that applicants have met the standards laid down by the Supreme Court requisite for the grant of a certificate.

It is noted that the applicants in their initial brief cited as precedent, among other cases, *Hope Natural Gas Company, et al.*, Docket No. G–12571, *et al.*, issued March 31, 1958, 19 FPC 405, the Commission's Opinion No. 315, in the *Transco-Seaboard* case, 20 FPC 264; the *Trunkline Gas Company* Opinion No. 321;[4] and a

[4] The Commission's Opinion No. 321 was issued May 22, 1959, 21 FPC 704, just one month prior to the issuance of the Supreme Court's Opinion in CATCO.

decision issued by the undersigned in Docket No. G–12580, 22 FPC 906, involving sales by independent producers to El Paso Natural Gas Company in the Aneth Field.

The most important cases decided recently which are relevant to this matter have been the so-called *CATCO* and the *Transco Seaboard* cases. Such precedents as may have been established in decisions prior to the *CATCO-Transco-Seaboard* decisions, insofar as they are inconsistent with these cases, must bow to the pronouncements of the Supreme Court. It is axiomatic that when the Supreme Court has spoken, all decisions of lower tribunals must thereafter be consistent with the Court's holding.

Recognition of this essential position may be found in the Commission's action in Docket No. G–16603, *et al.*, involving Transcontinental Gas Pipe Line Corporation. It will be recalled that in this docket an examiner issued a decision on October 2, 1959, 22 FPC 841, which involved, among other things, the problem of whether a certificate of public convenience and necessity should be issued to certain producers, including Kerr-McGee and Phillips, for the sale of natural gas in interstate commerce produced by them offshore Louisiana. The examiner authorized the sale of natural gas in this case at the initial price of 21.5 and 22.0 cents per Mcf plus tax reimbursement, *i.e.*, at rate levels substantially consistent with those proposed here.

The Public Service Commission of the State of New York, the United Gas Improvement Company, and the Long Island Lighting Company filed exceptions to the examiner's decision insofar as it authorized the issuance of unconditioned certificates to the independent producer applicants.

The Commission, in its order of November 17, 1959, 22 FPC 836, at pp. 838, 839 modifying and affirming the examiner[5] said, among other things, that:

> These interveners contend that these prices have not been shown to be required by the public convenience and necessity, and that the examiner erred in relying on the decision of the Court of Appeals for the Third Circuit in *United Gas Improvement Co., et al.* v. *F.P.C., et al.*, Nos. 12797 and 12805, 269 F. 2d 865, since this case is now the subject of a petition for certiorari in the United States Supreme Court. These contentions are without substance. The evidence of record in these proceedings supports the examiner's finding that the prices proposed will not establish any new price plateau,[3] will not

[3] See also the discussion and cases cited in *South Georgia Natural Gas Co., et al.*, Opinion No. 325, Docket Nos. G–9892, *et al.*, issued August 7, 1959, 22 FPC 211, 218–221, and in *Texas Gas Transmission Corp., et al.*, Opinion No. 327, Docket No. G–17335, *et al.*, issued August 10, 1959, 22 FPC 378, 386–388, showing that the present price plateau in this area does not rest solely upon the so-called "Catco" contracts or the Commission's certification of the "Catco" sales, and that producer prices comparable to those here proposed were not in effect disapproved by the Supreme Court's decision in the "Catco" case.

> trigger increases in other contracts under which Transco purchases gas in southern Louisiana, or elsewhere, and are not out of line with the prices which we have authorized to be paid by Transco and others in the area. The record also shows that there is an urgent need for these additional volumes of gas. In these circumstances, giving consideration to both the evidence as to price and the evidence of need for the gas, we conclude that the examiner properly found the proposed sales to be required by the public convenience and necessity and that certificates should be issued without condition as to price. This action is in accord with the decision of the

[5] The modifications of the examiner's decision were in regard to matters other than the producer prices.

United States Supreme Court in the "Catco" case, *Atlantic Refining Co., et al.* v. *Public Service Commission, et al.*, 360 U.S. 378, as well as with the decision of the Court of Appeals in the *United Gas Improvement Co.* case, which was decided in the light of and in reliance upon the Supreme Court's "Catco" decision.

Thereafter, the same parties who had objected to the issuance of unconditional certificates to the independent producers filed applications for rehearing of the Commission's order of November 17, 1959, *supra*, authorizing the sale of gas from South Louisiana and offshore Louisiana at the proposed initial prices of 21.5 and 22.0 cents per Mcf plus taxes.

On December 4, 1959, the Supreme Court granted a petition for a writ of certiorari from the Third Circuit's decision in the *Transco Seaboard* case, vacated the judgment of the Court of Appeals in that case and remanded the matter to that Court with directions to remand the case to the Federal Power Commission for reconsideration and redetermination in the light of *Atlantic Refining Company* v. *Public Service Commission of New York*, 360 U.S. 378.[6]

Subsequent to the Supreme Court's order in *Transco Seaboard*, the Commission, on January 15, 1960, granted the applications for rehearing filed by the interveners in Docket No. G–16603, *et al.* [unreported] but has not taken any further action in the matter.

In the light of the Supreme Court's determination it appears clear that reliance upon Opinion No. 315, *i.e.*, *Transco Seaboard*, in which the Third Circuit Court of Appeals affirmed the Commission's order in Opinion No. 315 is not well founded. As a matter of legal duty heed must be paid to the order of the Supreme Court vacating the Third Circuit's affirmance of the Commission's order in Opinion No. 315.

In legal principle the cases under consideration, insofar as the matter of conditioning prices is concerned, are not different from the *CATCO*, the *Transco Seaboard* case, or the case in Docket No. G–16603, *et al.* The Commission has not taken any action in either *CATCO*, the *Transco Seaboard* or in connection with the Transcontinental Gas Pipe Line Corporation case, Docket No. G–16603, *et al.* Consequently, there are no recent Commission decisions following the Supreme Court's action in *CATCO* and *Transco Seaboard* for the examiner to follow as precedent. In addition, reliance upon the examiner's decision in the Aneth case as a precedent for the issuance of a certificate to producers without price condition would not be well-founded because the Commission in its order in that case modified the examiner's decision by conditioning the certificate to a lower price than that reached in the contract between the producers and the buyer of the gas.

It seems clear enough, however, from the decisions of the Supreme Court that prices for gas in the Gulf offshore Louisiana at the level sought here for purchasers who have shown need for the gas cannot be justified on the kind of evidentiary showing and rationale employed here. The price of 21.3333 cents per Mcf plus taxes reached here was based simply on the operation of an escalation clause in a contract, not on the basis of any evidence showing that the initial or escalated price was one which should be authorized in a certificate proceeding where it is necessary to establish that the grant of the application at the rate level sought would serve public convenience and necessity by protecting the consumer against increased rate levels not justified by the evidence presented. As may be pointed out, had the gas in this proceeding been gas sold in interstate commerce rather than in foreign commerce, the applicants could not obtain 21.3333 cents without instituting a rate proceeding. The fact that the

[6] *United Gas Improvement Co., et al.* v. *F.P.C.*, 361 U.S. 195.

gas had been formerly sold in foreign commerce rather than in interstate commerce provides no justification on this record for increasing the price from 16.4 cents to 21.3333 cents. If this were the case then every seller in the Gulf offshore Louisiana which has a contract entered into in earlier years should be permitted to increase the rate level because in the last few years sellers in this area have been in a position to get more for their gas from necessitous buyers. The fact that gas could have been, or was to be sold in foreign commerce at escalated prices, *i.e.*, without the benefits of consumer protection commanded by the Act, is no reason for authorizing such unregulated and unjustified prices when the situation is changed to one where the Commission is under a Congressionally imposed duty to protect the consumers of the United States against excessively high prices.

The only justification which has been offered for issuing a certificate at this rate level is the undeniable fact that other sellers in the area are at this time, and at the time of the hearing were, getting prices substantially similar to those which are sought here.

The decisions of the Supreme Court in the *CATCO* and *Transco Seaboard* cases were made in a factual context not essentially dissimilar from that presented here. The effect of the Supreme Court's decisions is to destroy the basic pattern and legal reasoning upon which the producers and applicants in the Louisiana Gulf Coast, including the instant applicants, have up to now rested their cases for unconditioned certificates.

If certificates are to be granted at these rate levels, different and better proof and certainly different rationalization would have to be offered than was presented here.

The fact that a high, or at least a higher price level than existed a short time before is reached in an unregulated market is not a good ground for holding that it is a price level which should be authorized in a Section 7 proceeding in which the standards inherent in the phrase "public convenience and necessity" must be met.

The Staff submitted one exhibit which in reality is no more than a price distribution table showing some of the prices obtained in recent years for gas sold in Cameron and Vermilion Parishes, Louisiana, where the gas involved here is produced. It will be noted in this connection that a substantial number of the rate level figures cited are those involved in Opinion No. 315, *i.e.*, *Transco Seaboard*, and accordingly the value of this exhibit as precedent for establishing a price pattern which should be followed here is highly questionable. In addition, this table does not purport to show the average price of gas in the area but the price reached in very recent times, and the prices shown are not claimed to have any relationship whatever to normal regulatory standards. The fact that other persons in the area may be getting a certain price for gas in recently executed contracts does not by itself, and particularly in the absence of a determination that the new price is just and reasonable or affords adequate protection to consumers, establish that applicant has met the burden of proof required under the Act.

The price of the gas being sold in these proceedings was 16.4 cents per Mcf plus tax reimbursement on November 1, 1958. It rose to 21.3333 cents per Mcf plus tax reimbursement solely by reason of the operation of an escalation clause, *i.e.*, on the basis of "fair field price standards." This is an inadequate reason to establish that certification at the higher prices would serve public convenience and necessity.

On the basis of the evidence presented two possible courses are available. One would be to deny the application and the other would be to grant the application conditioned at a price of 16.4 cents per Mcf plus tax reimbursement. The

latter course is available not because it has been established that 16.4 cents per Mcf is a just and reasonable price but simply because the evidence presented does not indicate that the latter price is higher than is adequate for the protection of consumers against excessive or unreasonable prices. Nor is there any evidence that this level would be unjust or unreasonable to applicants. Nor is there even any claim that this rate level would be confiscatory.

In these circumstances, it will be found and concluded that certificates of public convenience and necessity should be issued herein but that such certificates should be conditioned at a rate level not to exceed 16.4 cents plus tax reimbursement. The 16.4 cent price would hold the line of prices in this case at that level which was in effect prior to the operation of the escalation clauses.

ADDITIONAL FINDINGS AND CONCLUSIONS

Upon consideration of the entire record herein, the evidence adduced, and the briefs filed, it is found and concluded, in addition to the findings and conclusions hereinbefore set out, that:

(1) The Phillips Petroleum Company, Kerr-McGee Oil Industries, Inc., and Commonwealth Oil Company, applicants herein, are "natural-gas companies" within the meaning of the Natural Gas Act.

(2) The sales of natural gas proposed by Phillips Petroleum Company and Kerr-McGee Oil Industries, to Tennessee Gas Transmission Company, the purchaser herein, and the sales by Phillips Petroleum Company and Kerr-McGee Oil Industries, Inc., to Commonwealth Oil Company and the sales by the latter to Tennessee Gas Transmission Company as purchaser are, and will be, sales of natural gas in interstate commerce requiring certificates of public convenience and necessity under the Natural Gas Act.

(3) The proposed sales of natural gas by Phillips Petroleum Company and Kerr-McGee Oil Industries, Inc., to Tennessee Gas Transmission Company have not been shown to be required by the public convenience and necessity at the price of 21.3333 cents per Mcf plus tax reimbursement for the natural gas which underlies and is the subject of the contracts between the sellers and the purchaser.

(4) The proposed sales of natural gas by Phillips Petroleum Company in Docket No. G–16611 and Kerr-McGee Oil Industries, Inc. in Docket No. G–16718 to Commonwealth Oil Company at the price of 18.9333 cents per Mcf plus tax reimbursement and the resale of such gas by the latter at the price of 21.3333 cents per Mcf plus tax reimbursement for the natural gas which underlies the contracts between the sellers and the purchasers have not been shown to be required by the public convenience and necessity at the aforesaid price levels.

(5) The sales of natural gas proposed in Docket Nos. G–16612 and G–16719 are required by the public convenience and necessity at a price not exceeding 16.4 cents per Mcf plus tax reimbursement to Tennessee Gas Transmission Company, and such price or rate is prescribed herein to protect the consuming public until the just and reasonable rate for the service is determined by the Commission.

(6) The sales of natural gas proposed in Docket Nos. G–16611 and G–16718 are required by the public convenience and necessity at a price not exceeding 16.4 cents per Mcf plus tax reimbursement by Phillips Petroleum Company and Kerr-McGee Oil Industries, Inc., to Commonwealth Oil Company less the gathering charge of the latter which on the volumes proposed to be certificated here is 2.4 cents per Mcf. and such price or rate is prescribed herein to protect the consuming public until the just and reasonable rate is determined by the Commission.

(7) The sales of natural gas proposed in Docket No. G–16679 by Commonwealth Oil Company to Tennessee Gas Transmission Company in Docket G–16679

are required by the public convenience and necessity at a price not exceeding 16.4 cents per Mcf plus tax reimbursement, and such price or rate is prescribed herein to protect the consuming public until the just and reasonable rate for the service is determined by the Commission.

ORDER

WHEREFORE, *It Is Ordered*, subject to review by the Commission, pursuant to its Rules of Practice and Procedure, that:

(A) Certificates of public convenience and necessity are hereby issued to Phillips Petroleum Company, Kerr-McGee Oil Industries, Inc., and Commonwealth Oil Company, authorizing the sale in interstate commerce of natural gas for resale to Tennessee Gas Transmission Company, as described in the applications filed in this proceeding, subject to the terms and conditions of this order.

(B) There shall attach to the certificates issued under paragraph (A) and to each of them and to the exercise of the rights thereto the condition that the recipients of said certificates file with the Commission within seventy (70) days of the issuance of this order rate schedules or supplements thereto providing for rates as set forth in findings (5), (6), and (7) herein under the gas purchase contracts involved in these proceedings in lieu of the prices provided for in the contracts between the parties.

(C) The certificates issued to the producers under paragraph (A) of this order are not transferable in any manner and shall be effective only so long as the applicants continue the operations authorized by this order in accordance with the provisions of the Act and the rules, regulations and orders of the Commission.

(D) The grant of the certificates to the applicants herein shall not be construed as a waiver of the requirements of Section 4 of the Act, or of Section 154 of the Commission's Regulations thereunder requiring the filing of rate schedules for the service herein authorized; and is without prejudice to any findings or orders which have been or may hereafter be made by the Commission in any proceeding now pending or hereafter instituted by or against the applicants. Further, the Commission's action in this proceeding shall not foreclose nor prejudice any future proceedings or objection relating to the operation of any price or related provision in the gas purchase contracts herein involved.

(E) Upon the acceptance of the certificates granted herein and the filing of revised rate schedules as provided herein, the temporary authorizations for service heretofore granted to the applicants herein shall expire.

SAMUEL BINDER,
Presiding Examiner.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

ZENITH NATURAL GAS COMPANY,[1] DOCKET NO. CP65-387

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT OF SERVICE AND FACILITIES

(Issued August 11, 1965)

On June 2, 1965, Zenith Gas System, Inc., filed in Docket No. CP65-387 an application pursuant to Section 7(b) of the Natural Gas Act for permission and approval of the Commission to abandon the sale of natural gas heretofore authorized in Docket No. G-12013 to Cities Service Gas Company from the Blanche

[1] Application filed by Zenith Gas System, Inc.

Sterling Gas Unit, Hartner Field, Barber County, Kansas, all as more fully set forth in the application.

The last production from the subject unit was in September 1962 and production facilities were removed in 1963. By letter agreement dated May 15, 1963, the related gas purchase contract was cancelled due to depletion of reserves.

By order issued May 28, 1965, in Docket No. CP65-316 (33 FPC 1137) Zenith Natural Gas Company was authorized, effective on June 8, 1965, to acquire and operate certain jurisdictional facilities of Zenith Gas System, Inc., in Kansas. Zenith Gas System, Inc., FPC Gas Tariff, Original Volume No. 2, was cancelled by said order. Rate Schedule F-1, under which the subject sale was made, was a part of said tariff. The certificate issued in Docket No. G-12013 was terminated by the order of May 28, 1965.

After due notice no petition to intervene, notice of intervention or protest to the granting of the application has been received.

At a hearing held on August 5, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits thereto, submitted in support of the authorization sought herein and upon consideration of the record,

The Commission finds:

(1) Zenith Natural Gas Company, a Delaware corporation having its principal place of business in Tulsa, Oklahoma, is a "natural-gas company" within the meaning of the Natural Gas Act as heretofore found by the Commission in its order of May 28, 1965, in Docket No. CP65-316 (33 FPC 1137).

(2) The sale and facilities proposed to be abandoned as hereinbefore described, all as more fully described in the application in this proceeding, are in interstate commerce subject to the jurisdiction of the Commission, and the abandonment thereof is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The proposed abandonment is permitted by the public convenience and necessity and should be approved as hereinafter ordered.

The Commission orders:

Permission for and approval of the abandonment of service and facilities as hereinbefore described, all as more fully described in the application in this proceeding, are granted.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

CONSOLIDATED EDISON COMPANY OF NEW YORK, INC., PROJECT NO. 2338

ORDER APPROVING REVISED PROJECT EXHIBITS

(Issued August 12, 1965)

On July 1 and 19, 1965, Consolidated Edison Company of New York, Inc., filed application for Commission approval of revised Exhibits J, L and M for its proposed Cornwall Pumped Storage Project No. 2338, located primarily in the Village of Cornwall and Towns of Cornwall and Highlands, on the Hudson River, New York, navigable waters of the United States. The application was filed pursuant to Articles 30, 31, 32 and 33 of the license.

Exhibit L—Supplement C shows that a weir will be installed and measurements will be made as required by Article 30. *Exhibit J-1 (FPC No. 2338-30) General Map*, is similar to license Exhibit Nos. 18 and 19, except that it shows

thereon the proposed park area for the Village of Cornwall, New York, to be formed from excavated material from the tunnel and powerhouse construction. *Exhibit L–1 (FPC No. 2338–8)—Plan—Penstock and Station*, and *Exhibit L–1A (FPC No. 2338–9) Cross Section of Penstock and Station*, are similar to license Exhibit Nos. 20 and 21, respectively, except for the redesignations. *Exhibit L–2 (FPC No. 2338–33) Tunnel & Intake Sections* (with the omission thereon of the typical dike section, which is shown on a separate drawing) is similar to license Exhibit No. 15, except that the intake structure shown thereon has been modified in accordance with the results of hydraulic model studies made pursuant to Article 32 of the license. *Exhibit L–2A (FPC No. 2338–34) Dike Sections*, supersedes license Exhibit Nos. 36, 38 and 39, and in general, shows the same design for the dikes, except that provisions are now included in the initial dike construction for the future raising to accommodate an ultimate water surface elevation of about 1,210 feet. Dike 3, facing Clove Creek, which is slightly over 3 feet lower than the other dikes, has not been model tested to withstand overtopping, as required by Article 32 of the license, and such model testing is still required.

Exhibit L–3 (FPC No. 2338–35) Cornwall East Switching Station—Modified Plan, and *Exhibit L–3A (FPC No. 2338–36)—Cornwall East Switching Station—Modified Elevation*, supersede license Exhibit Nos. 22A and 23A, providing for rearrangement of facilities and provisions for handling the proposed ultimate installation of about 3000 Mw.

Finally, *Exhibit M—Revised 7/16/65—General Description of Equipment in Three Sheets*, supersedes license Exhibit M since it shows minor changes in the specifications of the equipment.

The Commission finds:

(1) The following described revised exhibits conform to the Commission's Rules and Regulations and should be approved as part of the license for the project subject to model testing of the dike facing Clove Creek and it's further approval pursuant to Article 32 of the license.

Exhibit designation	FPC No.	Title
J—Sheet 1 (revised Mar. 24, 1965)	2338–30	General Map.
L—Sheet 1	2338–8	Plan—Penstocks and Station.
L—Sheet 1A	2338–9	Cross Section of Penstocks and Station.
L—Sheet 2 (revised Mar. 24, 1965)	2338–33	Tunnel and Intake Sections.
L—Sheet 2A (revised Mar. 24, 1964)	2338–34	Dike Sections.
L—Sheet 3 (dated Apr. 23, 1965)	2338–35	Cornwall East Switching Station—Modified Plan.
L—Sheet 3A (dated Apr. 23, 1965)	2338–36	Cornwall East Switching Station—Modified Elevation.
M—Revised (filed with the Commission on July 19, 1965).	----------	General Description of Equipment in Three Sheets.

(2) The following described exhibits now part of the license and which have been superseded are hereby eliminated from the license:

Exhibit No.

15	Sections & Details (exclusive of Typical Dike Detail)
18	General Map
19	Site Plan
20	Plan—Penstocks and Station
21	Cross Section of Penstock and Station
22A	Cornwall East Switching Station, Modified Plan
23A	Cornwall East Switching Station, Modified Elevation
36	Proposed Dike Design (Dikes 3 Facing Clove Creek)
38	Proposed Dike Crest, Dikes 1, 2, 4, and 5
39	Proposed Dike Crest & Toe Detail—Dike 3
M	General description of Equipment in Three Sheets.

The Commission orders:

(A) The revised exhibits as described in finding (1) above are hereby approved as part of the license for Project No. 2338.

(B) The exhibits described in finding (2) above as being superseded are hereby eliminated from the license for the project.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this order. In acknowledgment of the acceptance of this order, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

MIDWESTERN GAS TRANSMISSION COMPANY, DOCKET NOS. RP61-19 AND RP62-7; NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. RP63-6

ORDER DENYING APPEAL FROM PRESIDING EXAMINER'S RULING

(Issued August 12, 1965)

Pursuant to Commission order issued April 21, 1965, hearings were commenced on July 13, 1965, on the issue whether Midwestern Gas Transmission Company's (Midwestern's) rates should be computed as if it were still using liberalized depreciation for income tax purposes even though it had changed to straight-line depreciation. The issue was more fully stated by the Commission in its order issued October 13, 1964, as follows: "The question as to the proper treatment of depreciation in computing income taxes for rate-making purposes is one of the most important issues in this case, making a difference of close to $2 million in MGT's total cost of service. It is appropriate, before deciding this question, that MGT be given the opportunity to present evidence to show why it had changed to straight-line depreciation, how the use of liberalized depreciation in computing taxes for rate-making purposes might adversely affect its interests, the effect of its change to straight-line depreciation on the rates to be charged to its customers *vis-a-vis* the Commission's determination in Opinion No. 417, the method to be used in applying accumulated deferred taxes against its increased tax costs and any other relevant facts." (32 FPC 993 at p. 996)

The City of Chicago, Illinois (Chicago), an intervener in the above-entitled proceedings, at the opening of hearings on July 13, 1965, moved that the Presiding Examiner recess the hearings until an appropriate date subsequent to review and final decision of the court of last resort of Commission Opinion Nos. 417 and 417-A (Alabama-Tennessee Natural Gas Company, Docket No. G-5471, *et al.*) 31 FPC 208, 928. Chicago stated (Tr. 9) that to "proceed with this hearing without finality of Alabama-Tennessee having been determined will cause a waste of time and money through cross-examination and briefing procedures to the Presiding Examiner and subsequent decisions and before the Commission which may possibly be rendered moot and of no practical value should Alabama-Tennessee be over-ruled." Staff counsel joined in and supported the motion.

Midwestern objected, stating (Tr. 24) that a granting of the motion would have "most severe adverse consequences on Midwestern" in that any adjustments in rates which might result from these proceedings are to be effective as of October 13, 1964; that Midwestern has a right to know what its rates are

as of that date; and that if Chicago were to prevail on the merits, a revenue deficiency in excess of $1.9 million per annum, from and after that date, might result.

The Presiding Examiner denied the motion and subsequently, in compliance with Chicago's request, certified the question to the Commission for review.

Movants attempt to support the requested recess of these proceedings until final court action on Commission Opinion Nos. 417 and 417–A is not persuasive. Commission's Opinions and orders carry with them a presumption of validity which will continue unless set aside by the Commission on reconsideration or by the courts.[1] In a similar situation, it was held that a party is not entitled to a postponement in anticipation of a possible new justification which some future event might supply.[2] The company is entitled to know, as soon as possible, what its rights and obligations are. Additionally, it is our view that the filing was untimely. Our order was issued on April 21, 1965. Clearly, a motion to recess such proceedings should not be delayed until the date of hearing and the witnesses are presented and ready for cross-examination. Further, the balancing of the equities between the cost to the parties of trying the issue at this posture of the case as against the possible added cost to the company which may result from delay, weigh heavily in favor of continuing the hearings as scheduled without the recess sought.

The Commission finds:

Good cause has not been shown for postponement of the scheduled hearings in these proceedings.

The Commission orders:

The appeal of the City of Chicago from the ruling of the Presiding Examiner in these proceedings is hereby denied.

ORDER ADOPTING INITIAL DECISION OF PRESIDING EXAMINER

(Issued August 13, 1965)*

Syllabus

1. Requested condition by pipeline-intervener to prevent prejudice to its application in another docket, and agreed to by pipeline-applicant, found unobjectionable. PP. 510, 511.
2. Proposal that certificate be conditioned to require applicant to account for excess revenues rejected since accounting demanded seems futile and has no rational basis. PP. 511, 512.
3. Mere showing that pipeline would receive excess revenues on an incremental basis is insufficient to justify suggested certificate accounting condition; no showing has been made that pipeline's revenues are excessive on a system-wide basis. P. 512.

*Initial decision appears on p. 509.

4. Proper method of constructing pipeline's rates and question of whether a particular rate should be related to a single line or entire system cannot be adequately explored within limited compass of certificate proceeding. P. 512.
5. Issuance of certificate to Natural Gas Pipeline is without prejudice to determination in any future rate case of what part, if any, of facilities authorized here shall be included in rate base; suggestion that no part be included unless producer certificates are issued is rejected. P. 513.
6. Grant of certificate under Section 7 should not be considered decisive of possible future proceedings under Section 5. P. 514.
7. Commission *issues* certificates of public convenience and necessity under Section 7 of the Natural Gas Act.

F. Vinson Roach, Jack C. Osborne, Daniel B. O'Brien, Justin R. Wolf, and *Charles A. Case, Jr.* for Northern Natural Gas Company.

Charles C. McDugald, William W. Brackett and *Paul E. Goldstein* for Natural Gas Pipeline Company of America.

Raybourne Thompson, James W. McCartney, H. Curran, W. H. Drushel, Jr. for Transwestern Pipeline Company.

John W. Scott and *Louis L. DaPra* for Minnesota Valley Natural Gas Company.

C. Frank Reifsnyder, Stanley S. Harris and *E. G. Najaiko* for El Paso Natural Gas Company.

Robert M. Olson, W. L. Cole and *John Ormasa* for Pacific Lighting Gas Supply Co., Southern California Gas Co., and Southern Counties Gas Co. of California.

Richard F. Babcock and *F. P. Bosselman* for Peoples Gas Light and Coke Company and North Shore Gas Company.

Jack F. Kinney for Iowa Public Service Co.

Justin A. Stanley and *John L. McCausland* for Northern Illinois Gas Company.

Joseph T. Morrow and *Edward S. Schroer* for Northern Indiana Public Service Co.

John F. Gaston for Iowa Electric Light and Power Co.

Charles R. S. Anderson for Iowa Southern Utilities Co.

Raymond F. Simon and *Mathias M. Mattern* for City of Chicago, Illinois.

Mark W. Putney for Iowa Power and Light Company.

Lloyd J. Marti for Western Power & Gas Co.

Keith M. Stidd for City of Minneapolis, Minnesota.

George C. Mastor for Minneapolis Gas Company.

Arthur R. Renquist for Northern States Power Company.

Sherman S. Poland for Central Illinois Electric & Gas Company.

John A. Ferguson, Jr. for Gulf Pacific Pipeline Company.

Richard Tuttle, J. Calvin Simpson, Lawrence Q. Garcia for Public Utilities Commission and People of the State of California.

Edward J. Hartman for Iowa-Illinois Gas and Electric Company.

C. Louis Knight and *Agnes Mae Wilson* for the Staff of the Federal Power Commission.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

On August 3, 1965, the Presiding Examiner, Arthur H. Fribourg, issued an initial decision herein under Section 7 of the Natural Gas Act granting certificates of public convenience and necessity to each of the applicants in the proceeding involved in Phase I of these proceedings in accordance with their applications in Docket Nos. CP65-320, CP65-325, and CP65-169. No exceptions have been filed to the examiner's decision within the four-day period from the date of the decision stipulated by the parties for the receipt of exceptions.

The Commission further finds:

Upon consideration of the entire record in these proceedings, including the evidence adduced, the briefs filed, and the presiding examiner's initial decision, said decision should be adopted as the decision of the Commission in this case.

The Commission orders:

The initial decision of the presiding examiner issued herein on August 3, 1965, is hereby adopted and such decision shall become effective as the decision of the Commission as of the date of issuance of this order.

INITIAL DECISION
OF THE PRESIDING EXAMINER GRANTING CERTIFICATES UNDER SECTION 7 OF THE NATURAL GAS ACT

(Issued August 3, 1965)

FRIBOURG, *Presiding Examiner:* This decision relates to the same projects dealt with in the Commission's order of July 23, 1965, 34 FPC 110, issuing temporary certificates.

At the time of the hearings the situation appeared as one of great urgency, which may now be relieved by the Commission's grant of the temporary authorizations. The parties, in order to expedite the proceedings, agreed, with the Examiner's consent, not to submit briefs to the Examiner. Instead, oral argument was held on July 14, two days after the close of the hearing, and it was agreed to serve proposed findings and conclusions by July 21 by air mail. The last set of these was actually received by the Examiner on Friday, July 23. The parties have stipulated on the record without objection that they shall serve any exceptions to the Examiner's decision by air mail within four days of their receipt of the decision, and objections to the exceptions by air mail within four days of receipt of the exceptions.

This portion of the proceedings, which the Commission designated as Phase I in its order of June 4, comprises Docket Nos. CP65–320, CP65–325, and those portions of CP65–169 not involving the construction of gathering facilities in the Permian Basin.

Because it appeared that the hearings would probably be lengthy and that therefore Natural's Permian Basin line could not be built in time for the coming heating season, Natural and Transwestern agreed upon a temporary exchange of gas in order to provide an adequate supply for Natural's short-term needs. The exchange would involve a maximum of 130,000 Mcf per day, and would continue until the hearings in Phase II have been concluded and the construction of any facilities authorized thereunder have been completed. The exchange is desired so as to permit Natural to make its Permian Basin gas available to supply the needs of Natural's markets while Phase II is being decided, and particularly to meet those needs during the 1965–6 heating season. While this temporary exchange is in effect, Natural will pay Transwestern $59,000 per month plus 2.4 cents per Mcf for all gas exchanged in any one year up to 36,500,000 Mcf and 0.8 cents per Mcf for any additional volumes exchanged during the year.

The exchange is essential to the uncontested portion of Natural's expansion program under which it proposes, in this Phase I, to increase the maximum daily withdrawal capacity of its storage facilities by 50,000 Mcf, to raise the maximum inventory limitations of three storage fields, to increase the daily design sales capacity of its system by 185,000 Mcf, to transport and sell approximately 169,700 Mcf of natural gas to seventeen of its resale customers, to transport

22,700 Mcf for sale to its direct customer, Phillips Petroleum Co., and to construct and operate facilities for the transportation of natural gas to be produced from reserves located in the Indian Basin and Dagger Draw areas of Southeastern New Mexico to Transwestern's West Texas lateral in Eddy County, Texas, and from the West Cameron Block 17–49 Field Area of South Louisiana to a connection with its own existing Gulf Coast Line in Montgomery County, Texas. Under the exchange agreement Natural would deliver gas from its Indian Basin and Dagger Draw reserves to a connection with the Transwestern line in Eddy County, New Mexico. It would also deliver from its Bluitt reserves into Transwestern's existing Bluitt lateral in Roosevelt County, New Mexico.

Transwestern would redeliver equivalent volumes to Natural at points in Hansford and Gray Counties, Texas, where the two lines cross. Transwestern would build 35.2 miles of 24-inch loop line along its West Texas lateral and would install certain metering, compressing and other facilities. Natural proposes to spend $40,150,000 and Transwestern $3,391,000 on the Phase I construction.

Transwestern's application, as amended, provides that:

> In the event the final determination in the comparative proceedings in FPC Docket Nos. CP65–1, *et al.*, is adverse to Transwestern and its applications filed in CP65–208, CP65–236 and CP65–237 are denied and additional sales or deliveries from its system have not materialized, Transwestern will not include the cost of the facilities installed for the interim service in its rate base in any rate increase proceeding until such time as Transwestern can make proof that the additional capacity which such facilities provide is needed.

There is no dispute on the questions of markets, cost or design of facilities, gas supply, financing, economic feasibility, or the proposed changes in Natural's storage capacity. The Presiding Examiner finds that the unanimity in these regards is justified by the evidence of record, and concludes that the construction, sales, transportation, and the exchange of gas proposed in Phase I are required by the public convenience and necessity. The uncontested evidence of record shows that without the additional supplies of gas sought in this proceeding, Natural's utility and municipal customers will suffer a deficiency of over 200,000 Mcf on the peak day of this coming winter, and that there is no other source of supply capable of meeting these needs.

The issues here relate to the conditioning of the certificates. Three participants urge that the certificates be granted only conditionally.

Gulf Pacific Pipeline Company requests a condition to prevent prejudice to its own application pending in the consolidated proceedings in Docket Nos. CP63–204, *et al.* Prejudice, it says, may arise in the following way. The 35.2 miles of loop line along Transwestern's West Texas lateral will be required, irrespective of the outcome of Phase II of this proceeding, whenever Transwestern's maximum day deliveries to California increase to 640,000 Mcf. If Transwestern's interim service to Natural proposed in Phase I is terminated prior to a final Commission order in CP63–204, the existence of the 35.2 miles of loop line could be cited as argument in support of Transwestern's application in that proceeding at the expense of Gulf Pacific's application.

Transwestern has stated that it has no objection to the proposed condition. At the oral argument, the Presiding Examiner suggested that such a condition would make little difference, since he could not, by means of a condition, foreclose anything that another Examiner or the Commission might do in another docket. Gulf Pacific counsel responded that he believed this to be correct, but desired the additional protection because "* * * we have been met with this line

of argument for a considerable number of years," *i.e.*, that Transwestern's existing capacity should give it priority.

Viewed as an agreed-upon restriction on Transwestern's position in another docket, the condition is unobjectionable, and it is therefore included as a part of this decision. It should be understood, however, that its inclusion is not intended to prejudge, restrict, or in any way affect the action of the Presiding Examiner or of the Commission in that or any other docket.

The State of California asks for a condition requiring Transwestern

> to account for revenues from the exchange in excess of the incremental cost of service applicable to the proposed new facilities pending a determination in Phase II of these consolidated proceedings of the amount of such revenues payable to its existing customers to compensate for the loss of use of existing facilities currently serving such existing customers.

California would require all or part of such excess revenues to be passed on to Transwestern's existing customers as rate relief. The basis for this demand is that Transwestern's Panhandle lateral, which was constructed to serve the California market, will now transport gas in the opposite direction to serve the purposes of the exchange with Natural. The cost of service of this lateral, says California, is reflected in the rates charged California customers, and since the exchange will produce a substantial excess of revenues over incremental costs, California is entitled to share in that excess. The exchange, says California,

> will have an immediate impact upon the California market in that a facility presently dedicated to that market will be put to a use entirely unrelated to that market, although its cost of service is and will be reflected in the rates paid by that market.

As the Commission observed in *Colorado Interstate Gas Co.*, Docket No. CP64-294, 33 FPC 281 (Opinion No. 450, February 18, 1965), there are situations in which it will consider the effect of the grant of a certificate upon the rates charged to existing customers. Here, however, the "impact" alleged by California is not such that Transwestern's service to it will be impaired. During the probable period of the interim exchange, California will have as much gas available to it as before, at the same price, and special provisions acceptable to California and to Transwestern's California customers have been made to limit any possible reduction in the Btu content of the gas as a result of the interchange.

California is not claiming that the price Transwestern will receive is not in the public interest. (In this connection it should be noted that Natural, who is the party that will pay the price, states that its rates are already adequate to cover the expenses to be incurred under the interim exchange agreement and that it does not intend to pass any of these expenses on to its customers. It will live within its present rate framework.) California seeks not to lower the price but to share in it. In this respect its position is much like that of the Kansas-Nebraska Natural Gas Company, Inc., in the *Colorado Interstate* proceeding, *supra*. Kansas-Nebraska was seeking to condition a certificate to be issued to its supplier for a sale of gas to a third party. The condition it sought was a lowering of the rate that its supplier was charging it. The reason advanced was much the same one that California advances here, namely, that the line had been built to serve it and was now being diverted to another use. This Commission correctly held that such a question is not properly part of a certificate case.

Even if it were proper to raise this issue in this type of proceeding, however, there would be serious question as to the legality of the condition California seeks. To order a refund to California customers, the Commission would have to decide that the rate *to them* was unjust and unreasonable, or discriminatory,

which is a finding it can only make in a rate case. The Natural Gas Act gives the Commission no reparation power. Assuming that Transwestern were to be required to keep account of the profits it makes as the result of rates charged Natural on the exchange of gas, the Commission could not force it to turn all or part of those profits over to its California customers at some later date. That would not be a refund of any money that any California customer would have paid. It would be a dividend declared by the Commission to California customers out of Transwestern's profits, and plainly illegal. Therefore, although the Commission may prescribe the form in which interstate pipeline accounts are kept, the accounting demanded here seems futile, and consequently should be denied. Conditioning must have a rational basis.

Transwestern has stated on the record that it would refuse a certificate so conditioned.

Staff argues against California's proposal on the ground that the mere showing that Transwestern would receive excess revenues on an incremental basis is insufficient to justify the suggested condition. Staff points out that California has failed to show that Transwestern's revenues are excessive on a systemwide basis. The Examiner agrees that there has been no such showing. Certainly the proper method of constructing Transwestern's rates and the question whether a particular rate should be related to a single line or to the entire system is a matter that can not be adequately explored within the limited compass of a certificate proceeding under Section 7 of the Act.

For the foregoing reasons the Examiner rejects California's proposal.

Staff proposes that the certificate to be issued to Natural be conditioned to provide that the cost of facilities to be constructed to enable Natural to receive gas from the California Company in the West Cameron Block 17–49 Field Area of Southern Louisiana and also to receive gas in the Indian Basin and Dagger Draw Areas of New Mexico shall not be included in Natural's rate base until

> certificates authorizing the sale of such gas have been issued to, and accepted by, the California Company and producers of gas in the Indian Basin and Dagger Draw Areas who have contracts for the sale of such gas to Natural, and who are able to produce and sell to Natural such gas in volumes aggregating at least 130,000 Mcf of gas per day.

Whether Commission policy requires the pipeline or the producer to be certified first is a matter of some doubt. During oral argument the following colloquy with Staff counsel took place:

> PRESIDING EXAMINER: What has been the Commission's policy on that, Mr. Knight? Which comes first, the chicken or the egg? Does the producer have to have his certificate to sell before the pipeline gets authority to take, or vice versa, or doesn't it matter?
>
> Mr. KNIGHT: I do not know that there has been a policy in that regard. * * *

Apparently the policy is a flexible one depending on the needs of the case. In *The California Company*, 22 FPC 211, 239, the Commission permanently certificated a large sale for future delivery even though the pipeline buyer had no facilities built to receive the gas. Producer certificates have been issued even where there was some question as to the jurisdictional status of some of the related pipeline facilities. *Medina Gathering Corp.*, 30 FPC 227. On the other hand in *E. E. Fogelson*, 31 FPC 476, the Commission refused to issue certificates to producers on the ground that to do so would be to prejudge pending proceedings in the docket in which a pipeline was seeking permission to connect with them. Yet in *Turnbull & Zoch Drilling Co.*, Docket No. G–17960, order issued September 29, 1964, 32 FPC 877 at p. 878, it held that " * * * the *Fogelson* rule as enunciated was not intended to be as broad as the Examiner suggests," and

producer certificates were granted because the pipelines there, unlike the situation in *Fogelson*, were not objecting to the grant of producer certificates and the pending pipeline application was not the subject of a competitive proceeding. Subsequently, *Fogelson* was relied on as the basis for refusing a producer certificate in *First Transportation Gas Corporation, Inc.*, Docket No. CI61-985, order issued November 24, 1964, 32 FPC 1362.

The present question is the mirror image of that presented in those cases. Instead of the question whether producer certificates should issue before the pipeline can take, we have here the question whether pipeline construction should be authorized before the producers are certificated. Staff here is attempting to guard against prejudgment of certain pending producer certificate cases. Staff counsel stated, as part of the colloquy above referred to:

> * * * I thought that condition would protect the Commission against any pressure arising out of the fact that certain facilities might have been constructed, the cost incurred, and then the argument be made that you authorized these facilities and therefore you ought to go ahead and certificate these producers.

There is another consideration not mentioned by the Staff which is probably of greater importance. The Commission may be presumed to be capable of withstanding pressure of the type mentioned and of judging the producer certificates independently of what is done here. But if those certificates are for any reason denied, Natural may have built its facilities to no purpose. In that event the facilities should not automatically become part of Natural's rate base. If Natural wishes to build in the face of the risk that there will be no gas supply, its customers should not have to pay for construction not used and useful.

It is impossible to say now whether producer certificates will be granted. The examiner therefore will direct that the certificate to Natural be issued without prejudice to the determination, in any future case involving Natural's rates, of what part, if any, of the facilities hereby authorized shall be included in the rate base. This provision is fairer than Staff's suggestion that no part be included unless 130,000 Mcf of producer certificates are issued. If, for instance, some lesser amount should be certificated, the construction now proposed may be both used and useful, though not to the extent now planned or hoped for. In such circumstances the Commission in a rate proceeding may be justified in including only part of the original cost in the rate base. Such a determination need not be made now if Natural accepts the risk that it may be made then.

Staff also proposes a condition that

> in the event that the Commission's decision in Phase II of this proceeding * * * results in any of the Phase I facilities not being fully used, a proportionate part of the cost of such facilities will be excluded from Transwestern's rate base and from Natural's rate base until the full capacity of such facilities is needed.

Staff gives no indication in its proposed findings and conclusions as to what is meant by "fully used," or "until the full capacity of such facilities is needed," nor did it do so in the oral argument. The condition is included among Staff's proposed conclusions but finds no basis in any of its proposed findings.

Transwestern has stated on the record that in the event that the final determination of Phase II of this proceeding is adverse to it and its applications in Docket Nos. CP65-208, CP65-236 and CP65-237 are denied, Transwestern will not include the cost of the facilities installed for interim service in its rate base in any rate proceeding until it can prove that the additional capacity supplied by such facilities is needed.

Natural's counsel conceded on oral argument that in a rate proceeding

> * * * anybody can challenge the question of whether or not our facilities are both used and useful, and to the extent they are not they are excluded from the rate base, as I understand my administrative law and the law here before the Commission, but I don't think we should be required to go beyond that, Your Honor. We accept that responsibility that we must always show that all items of our rate base are used and useful in a rate proceeding. This we will do; this we have always done.

The Examiner believes that the grant of a certificate under Section 7 should not be considered decisive of possible future proceedings under Section 5. If it is shown in a rate proceeding that certain property is neither used nor useful it seems reasonable to exclude it from the rate base. In a certificate case like the present one there may be value in incorporating this thought into the certificate. It reduces the chance that in a future rate proceeding a party will point to the certificate to support the claim that the authorized construction must necessarily be a part of the rate base, even though at the time of authorization the possibility existed that the construction would not be useful.

Staff's proposal, however, goes too far in its attempt to govern the course of a possible future rate case. If the certificate is issued without prejudice to a determination of rate-base in any other proceeding, the public will be adequately protected. It is not necessary to determine, in this certificate case, a rate-base question which has not arisen, which may not arise and which calls for no decision at this time. It is sufficient if the Commission has a free hand when and if the time comes, and puts the parties on notice of that fact now.

ADDITIONAL FINDINGS AND CONCLUSIONS

Upon consideration of the record, including the oral arguments of counsel and the proposed findings and conclusions, it is found and concluded with respect to Phase I of these proceedings in addition to the findings and conclusions heretofore stated, that:

(1) The applicants, Natural Gas Pipeline Company of America and Transwestern Pipeline Company, are engaged in the sale of natural gas in interstate commerce for ultimate public consumption, subject to the jurisdiction of this Commission, and each is a "natural-gas company" within the meaning of the Natural Gas Act.

(2) Each applicant is able and willing properly to do the acts and perform the services proposed in their respective applications in Docket Nos. CP65–320, CP65–325 and CP65–169, and to conform to the requirements of the Natural Gas Act and the requirements, rules and regulations of the Commission under that Act.

(3) The construction and operation of the proposed facilities, including storage facilities, and the transportation, sale and exchange of natural gas proposed by the applicants are required by the public convenience and necessity, and certificates therefor should be issued as hereinafter ordered and conditioned.

(4) The rate proposed by Transwestern for service to Natural as a rate for the interim exchange here involved is required by the public convenience and necessity.

(5) The findings and conclusions herein made are without prejudice to any position any participant may desire to take with respect to any of the issues in Phase II of this proceeding.

ORDER

WHEREFORE, *It Is Ordered:*

(A) A certificate of public convenience and necessity is hereby issued to each of the applicants authorizing them to construct and operate the facilities,

including storage facilities, and to transport, exchange and sell natural gas as described in their applications in Docket Nos. CP65–320, CP65–325 and CP65–169, to the extent involved in Phase I of these proceedings, upon the terms and conditions of this order.

(B) In the event that the final determination in the comparative proceedings in Docket No. CP65–1, *et al.*, is adverse to Transwestern, and its applications filed in Docket Nos. CP65–208, CP65–236 and CP65–237 are denied, and additional sales or deliveries from its system have not materialized, Transwestern shall not include the cost of the facilities installed for the interim service in its rate base in any rate increase proceeding until such time as Transwestern can make proof that the additional capacity which such facilities provide is needed.

(C) The authorization issued to Transwestern is without prejudice to the application of Gulf Pacific Pipeline Company in the consolidated proceedings at Docket No. CP63–204, *et al.*

(D) All authorizations herein granted are without prejudice to any future determination, in any Commission proceeding, of what portion, if any, of the facilities herein authorized shall be included in the respective rate bases of the applicants.

(E) Natural shall enrich the gas delivered to Transwestern from reserves in the Indian Basin and Dagger Draw areas in accordance with its letter agreement with the Pacific Lighting Companies dated April 16, 1965 and accepted by them by letter of July 7, 1965.

(F) Transwestern shall guarantee that, subject to the assurances given by Natural, the exchange of gas pursuant to their temporary exchange agreement will not cause the thermal content of gas delivered by Transwestern to California to fall below 1,065 Btu per cubic foot.

(G) The certificates granted hereby and the rights to be exercised thereunder are conditioned upon compliance by the applicants with all applicable regulations of the Commission under the Natural Gas Act and particularly Section 157.20 of those Regulations.

ARTHUR H. FRIBOURG,
Presiding Examiner.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

KANSAS-COLORADO UTILITIES, INC., DOCKET NO. CP65–418

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT OF FACILITIES AND ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 16, 1965)

On June 28, 1965, Kansas-Colorado Utilities, Inc. (Applicant) filed in Docket No. CP65–418 an application pursuant to Sections 7(b) and 7(c) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities and for a certificate of public convenience and necessity authorizing the construction and operation of meter stations and the sale of natural gas on an interruptible basis for resale to Plateau Natural Gas Company (Plateau), parent company of Applicant, all as more fully set forth in the application.

Applicant seeks permission and approval to abandon by transfer to Plateau the facilities serving the so-called Wilcon, Coldwater, Rehm, East Rehm and parts of the Sedan and Romero irrigation systems in Texas and New Mexico,

which facilities were heretofore authorized to be acquired and constructed by Applicant by Commission order issued June 1, 1965, 33 FPC 1142, in Docket No. CP65–55. Plateau will render the natural gas service for irrigation by means of the above facilities in place of Applicant.

The ultimate rates to be charged by Plateau will be the same as those proposed by Applicant in Docket No. CP65–55.

Applicant proposes to construct and operate 16 meter stations in Dallam and Hartley Counties, Texas, and Union County, New Mexico for measurement of the natural gas sold by it to Plateau for resale to irrigation customers. The sale will be made under Applicant's I–1 Rate Schedule, on file with the Commission. Plateau's third year requirements are estimated to be 2,534,609 Mcf.

Total estimated cost of Applicant's proposed construction is $29,480, and will be financed with cash on hand.

Projected third year revenues and expenses indicate that Applicant will realize a 6 percent rate of return on its investment from the proposed sale to Plateau, as compared to 5.63 percent in the original proposal. Thus the project appears feasible.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 12, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits thereto, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Kansas-Colorado Utilities, Inc., a Kansas corporation having its principal place of business in Colorado Springs, Colorado, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of October 5, 1953, in Docket No. G–2138 (12 FPC 750).

(2) The proposed construction and operation of facilities and sale of natural gas by Applicant are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(4) The proposed construction and operation of facilities and sale of natural gas by Applicant are required by the public convenience and necessity, and a certificate therefor should be issued as hereinafter ordered and conditioned.

(5) The proposed abandonment of facilities by Applicant is subject to the provisions of Subsection (b) of Section 7 of the Natural Gas Act.

(6) The proposed abandonment of facilities by Applicant is permitted by the public convenience and necessity, and approval therefor should be granted as hereinafter ordered.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to Applicant, Kansas-Colorado Utilities, Inc., authorizing the construction and operation of facilities and sale of natural gas hereinbefore described, as more fully described in the application in this proceeding, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities hereby authorized shall be constructed and placed in actual operation, and the sale of natural gas shall be undertaken, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations, within one year from the date on which this order issues.

(D) Permission for and approval of the abandonment by Applicant of the facilities hereinbefore described, as more fully described in the application in this proceeding, are granted.

(E) Applicant shall advise the Commission of the date of abandonment of said facilities within 10 days thereof.

(F) The interruptible service authorized herein shall be curtailed or interrupted to the extent required to meet existing or future contracted maximum delivery obligations of Applicant for firm service to its customers.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

THE SUSQUEHANNA POWER COMPANY AND PHILADELPHIA ELECTRIC POWER COMPANY, PROJECT NO. 405; PHILADELPHIA ELECTRIC COMPANY, PROJECT NO. 2355

ORDER FURTHER AMENDING LICENSE FOR PROJECT NO. 405 AND DENYING APPLICATION FOR APPROVAL OF AGREEMENT BETWEEN LICENSEES FOR PROJECT NOS. 405 AND 2355

(Issued August 16, 1965)*

On December 21, 1964, the Susquehanna Power Company and Philadelphia Electric Power Company, joint licensees of Project No. 405 (Conowingo) filed an application for an amendment of the license which would add the following conditions:

(1) The Conowingo Reservoir shall be available to Project No. 2355, Muddy Run, as a source of water and as a lower pool for the period of Muddy Run license;

(2) The operation of the Conowingo Project shall be such as not to affect injuriously the operation of the Muddy Run Project during the period of the Muddy Run license.

Public notice of this application was issued on February 8, 1965. A supplemental application for amendment of the license was filed by Conowingo on May 13, 1965, seeking a modification of Article 27 deleting therefrom the requirement that the Philadelphia Electric Power Company secure Commission approval of any security issue to which it is a party.

At the time of filing its initial application for amendment of its license, Conowingo together with Philadelphia Electric Company, Licensee for Project No. 2355 (Muddy Run) filed an application for the approval of an agreement entered into between themselves on December 16, 1964. This agreement provides in substance for the joint use of the Conowingo Reservoir by the parties for the full term of the Muddy Run license as well as for the installation in Conowingo's powerhouse of equipment designed to operate Muddy Run by remote control.

In support of its initial application for amendment of its license Conowingo refers to the following language in the Commission's Opinion No. 443, dated September 21, 1964 (32 FPC 826) as amended by order issued November 9, 1964, 32 FPC 1288:

> In addition, we shall by Article 15 of the Muddy Run license require Muddy Run to coordinate its operation with that of Conowingo, and by

*See order issued October 5, 1965, granting rehearing for further consideration.

Article 43 require Muddy Run to avoid any action to impair the existing Conowingo operations. Under these circumstances, we do not believe that in order to protect Muddy Run the Conowingo license needs to be modified to add reciprocal articles providing that the licensee thereof will (1) permit the use of its reservoir by Muddy Run, and (2) will not operate Conowingo in a manner inconsistent with the optimum operation of Muddy Run. If, however, the licensees of the Conowingo project were desirous of including additional license terms and conditions to this effect in the license we would not object to the amendment of the Conowingo license to incorporate appropriate terms and conditions.

While the Commission remains amenable to the addition to the Conowingo license of appropriate conditions regarding the use of the Conowingo Reservoir by Muddy Run, the conditions proposed by Conowingo exceed the term of the Conowingo license and to that extent we believe that these conditions are inappropriate.

Conowingo's license expires in 1976; Conowingo seeks to add conditions to be effective until 2014, some 38 years beyond the term of the license. It is fundamental that the terms and conditions of a license may not extend for a period beyond the expiration of its term.

In a letter dated March 30, 1965, the Philadelphia Electric Company, licensee for Muddy Run, cites as a precedent for the requested amendment the Commission's order issued October 12, 1962, in the matter of Alabama Power Company's Jordan Nos. 1 and 2 development, Project Nos. 618 and 2146, respectively (28 FPC 584), and in particular Article 39 of the license for Project No. 618, which reads as follows:

> *Article 39.* In the event that this development is acquired by an entity other than the original licensee, it shall be maintained so as to permit Jordan No. 2 development to be operated in accordance with the provisions of Article 49 of the license for Project No. 2146 and shall be operated on the water made available by and in accordance with the provisions of such Article 49. Any water releases required by Articles 15, 18 or 34 of this license shall be made from water available to the new licensee pursuant to the terms of the aforesaid Article 49.

While Article 39 does not become applicable until Project No. 618 is acquired by some other entity, Article 39 does not purport to remain in effect beyond the license term of Project No. 618.

As we stated in our Opinion No. 443, it is not necessary to amend the Conowingo license in order to permit the use of the Conowingo reservoir by Muddy Run or to insure that Conowingo will not operate its project in a manner inconsistent with the optimum operation of Muddy Run. We believe, however, that the addition of the conditions suggested by Conowingo, limited, of course, to the duration of the Conowingo license, would be appropriate and would call attention to the joint use status of the reservoir at the expiration of the Conowingo license. We think it would also be appropriate at this time to add two standard conditions, relating to coordinated project operations and multiple use of reservoir waters, currently incorporated in licenses issued by the Commission. Accordingly, we shall amend the license for Project No. 405, to include the aforementioned conditions.

In connection with the proposed amendment, we have received letters from the Lancaster County Planning Commission, the Pennsylvania Fish Commission and the Federated Sportsmen of Lancaster County, respectively, urging that the Licensees provide access to the Conowingo reservoir in Pennsylvania for recreational purposes. On June 8, 1965, the Licensees for Conowingo submitted a recreational plan for the Conowingo project which does not include facilities

recommended by those Pennsylvania interests. While we do not intend to pass upon this plan in the instant order we are concerned with the requests of the Pennsylvania interests and shall seek Conowingo's cooperation with regard thereto. In any event, the Commission will give consideration to providing access to the Conowingo reservoir in Pennsylvania in passing upon the recreational plan for the Muddy Run Project.

The agreement for which Conowingo and Muddy Run seek Commission approval purports to transfer property rights. As envisioned by the Commission in its Opinion No. 443, granting license for Muddy Run, the property rights to be transferred are, for example, interests of land in or near the reservoir previously under the exclusive control of Conowingo which would be required by Muddy Run for its intake and powerhouse facilities. The acquisition of such rights by agreement would obviate the necessity of invoking Section 21 of the Act in order to acquire easements or such other land rights as may be necessary for the use of the Conowingo reservoir, including the location of Muddy Run intake facilities therein.

The rights involved in the subject contract, however, are of a different order. One of these is a right granted by Conowingo to Muddy Run to use the Conowingo reservoir for the full term of Muddy Run's license. The Commission provided for the joint use of the Conowingo reservoir by Conowingo and Muddy Run pursuant to its authority under Section 10(a) of the Federal Power Act, as set forth in its Opinion No. 443, making clear the separate identities of the respective projects. For the reasons already expressed we cannot in effect extend the Conowingo license beyond its expiration date.

A further right granted by the proposed agreement for the term of the Muddy Run license would permit the licensee for Muddy Run to install equipment in the Conowingo powerhouse for its operation by remote control from Conowingo and provide for ingress and egress. Recognizing the corporate relationship between the licensees, we believe it would not be contrary to the public interest to have the Muddy Run plant operated by remote control from the Conowingo powerhouse and we would have no objection to the installation of necessary equipment upon Commission approval of plans therefor. While we would likewise not object to an agreement between Muddy Run and Conowingo providing for such an installation for the term of the Conowingo license, as indicated in Opinion No. 443, the Commission is given no authority to approve agreements which might impair the rights of successors to the Licensee. Notwithstanding that the agreement might well be adhered to by a future operator of Conowingo, the Commission is not disposed to approve such an agreement which extends beyond Conowingo's license term.

The agreement also provides for reimbursement to Conowingo by the Licensee for Muddy Run for damages during construction of Muddy Run. It should be noted that Section 10(c) of the Federal Power Act imposes a liability upon a Licensee for all damages occasioned to the property of others as a result of construction. In any case, an agreement covering this subject does not require our approval.

Conowingo in its supplemental application for amendment seeks the deletion of subparagraph (b) of Article 27 which requires that Philadelphia Electric Power Company obtain approval of the Commission for the issuance of securities. The requested deletion is consonant with suggestions made by the Commission in letters to Licensee dated February 26, 1946 and March 19, 1965, respectively.

The Article 27(b) requirement of the license was necessary when the license was issued in 1926 because the State of Pennsylvania had no jurisdiction over the issuance of securities by Licensee. Since that time, however, jurisdiction

to regulate the issuance of securities by utilities operating within the State of Pennsylvania was conferred upon the Pennsylvania Public Utility Commission in 1937 and thus subparagraph (b) of Article 27 is no longer applicable.

Subparagraph (a) of Article 27 of the license requires the Susquehanna Power Company to secure approval of its security issues from the Public Service Commission of Maryland. The provisions of Section 204(f), enacted as part of the Federal Power Act in 1935, exempts from approval by this Commission the issuance of securities of a public utility organized and operating in a State under the laws of which its security issues are regulated by State commission. Since Susquehanna is required by State law to obtain the approval of the Maryland Commission in connection with security issues, the retention of subparagraph (a) of Article 27 is not necessary. We shall therefore delete Article 27 in its entirety.

The Commission finds:

(1) It is consistent with the public interest that the license for Project No. 405 be further amended as hereinafter provided.

(2) Approval of the agreement between Licensees for Conowingo and Muddy Run covering a period extending beyond the term of Conowingo's license is inconsistent with the provisions of the Federal Power Act.

The Commission orders:

(A) The license for Project No. 405 is hereby amended by deleting therefrom Article 27 and adding thereto the following articles:

(1) *Article 36:* The Conowingo Reservoir shall be available to Project No. 2355, Muddy Run, as a source of water and as a lower pool.

(2) *Article 37:* The operation of the Conowingo Project shall be such as not to affect injuriously the operation of Project No. 2355, Muddy Run.

(3) *Article 38:* The Licensee shall, after notice and opportunity for hearing coordinate the operation of the project, electrically and hydraulically, with such other power systems and in such manner as the Commission may direct in the interest of power and other beneficial public uses of water resources, and on such conditions concerning the equitable sharing of benefits by the Licensee as the Commission may order.

(4) *Article 39:* On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply, for steam-electric, irrigation, industrial, municipal or similar purposes, consistent with the primary objective of the project. The Licensee shall receive such reasonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission, in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

(B) The application for approval of the aforesaid agreement between Conowingo and Muddy Run be and is hereby denied.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license amendment. In acknowledgment of the acceptance of this license amendment, it shall be signed for the Licensees and returned to the Commission within 60 days from the date of issuance of this order.

(D) This amendment in the manner set out above shall not operate to alter or amend the license in any other respect, and shall not in any way constitute a waiver of any other part, provision or condition of the license.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

EL PASO NATURAL GAS COMPANY, DOCKET NO. CP65-408

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 17, 1965)

On June 18, 1965, El Paso Natural Gas Company (Applicant) filed in Docket No. CP65-408 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of approximately 4.9 miles of 12¾-inch pipeline and modification of existing facilities in its Newman Power Plant Meter Station, so as to provide for the continued direct sale and delivery of natural gas by Applicant to El Paso Electric Company (Electric Company) for electric power generation in its Newman Power Plant at a delivery pressure of not more than 100 psig without the necessity for reduction from main line pressure of 800 psig in its California Mainline System, all as more fully set forth in the application.

Applicant proposes to construct and operate approximately 4.9 miles of 12¾-inch pipeline and necessary appurtenances adjacent to and parallel with its California Mainline System, extending from a point of connection with its El Paso Mainline System to a point of connection with its 10¾-inch lateral extending from the California Mainline System to the Newman Power Plant of El Paso Electric Company; and to make modifications in its existing Newman Power Plant Meter Station. The proposed facilities will assertedly enable Applicant to effect savings in fuel requirements of its El Paso Compressor Station, provide the means for periodically shutting-down its No. 3 Compressor Station, and continue the delivery of natural gas to El Paso Electric Company's New Plant.

The estimated cost of the proposed construction is $184,000, which will be defrayed from currently available working funds.

After due notice no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 12, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence including the application and exhibits, submitted in support of the authorization sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, El Paso Natural Gas Company, a Delaware corporation having its principal place of business in El Paso, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of October 29, 1942, in Docket Nos. G-242 and G-257 (3 FPC 851).

(2) The proposed construction and operation of facilities, as hereinbefore described, and as more fully described in the application and exhibits in this proceeding are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) The aforesaid proposed construction and operation of facilities is required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) Applicant is able and willing properly to do the acts and to perform the services proposed and to conform to the provisions of the Natural Gas Act, and the requirements, rules and regulations of the Commission thereunder.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon El Paso's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to the Applicant, El Paso Natural Gas Company, in this proceeding authorizing the construction and operation of facilities, all as more fully described in the application and exhibits herein, subject to the jurisdiction of the Commission, upon the terms and conditions of this order.

(B) The certificates issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4), and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized to be constructed and operated by Applicant shall be completed and placed in actual operation, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations within six months of the date on which this order issues.

(D) The certificate issued by paragraph (A) above shall not be construed as authorization for an increase in maximum deliveries.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

EQUITABLE GAS COMPANY, DOCKET NO. CP62-186

ORDER FURTHER AMENDING ORDER ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 17, 1965)

On June 8, 1965, Equitable Gas Company (Petitioner) filed in Docket No. CP62-186 a petition, as supplemented on June 9, 1965, for a further extension of time in which to complete construction and place in operation certain natural gas transportation facilities authorized in said docket by order issued June 29, 1962, 27 FPC 1381, all as more fully set forth in the petition as supplemented.

By the order of June 29, 1962, the Commission issued to Petitioner a certificate of public convenience and necessity authorizing the construction and operation of certain facilities for the operation of the proposed Mobley Storage Field in Wetzel County, West Virginia. As part of the proposed project Petitioner was authorized to construct and operate 9 miles of 12-inch pipeline extending

from its Logansport Storage Pool to its then-existing transmission system. All facilities were required to be constructed and placed in actual operation within two years. By order issued June 26, 1964, 31 FPC 1589, that time was extended for one year so that Petitioner could complete collection of geological data with respect to the Mobley Storage Field.

Operation of the storage field and study of available data has indicated to Petitioner that the capacity of the storage reservoir may be greater than was anticipated prior to commencement of operations. Accordingly, Petitioner considers it advisable to gather additional geological data and delay construction of the pipeline pending a more positive determination of the capacity of the pool since such a determination could have an effect upon the size and location of the line. Petitioner requests a further extension of time until June 29, 1967, in which to complete construction and place the line in actual operation.

The Commission finds:

It is necessary and appropriate in carrying out the provisions of the Natural Gas Act and the public convenience and necessity require that the order issuing a certificate of public convenience and necessity to Petitioner should be further amended by extending the time in which to complete construction and place in actual operation facilities authorized by said order.

The Commission orders:

The order issuing a certificate of public convenience and necessity to Petitioner is further amended by extending the time in which to complete construction and place in actual operation facilities authorized therein to and including June 29, 1967, and all other respects said order shall remain in full force and effect.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

MONONGAHELA POWER COMPANY, PROJECT NO. 2477

ORDER ISSUING PRELIMINARY PERMIT

(Issued August 17, 1965)

Application was filed on June 22, 1964, by Monongahela Power Company (Applicant) of Fairmont, West Virginia, for a preliminary permit under Section 4(f) of the Federal Power Act (Act) for proposed Project No. 2477, a pumped storage hydroelectric plant, to be known as the Rowlesburg Pumped Storage Hydroelectric Project, to be located on Cheat River, in Preston County, West Virginia, near the Town of Rowlesburg.

As described in the application, the proposed project will consist of: a high level off-stream "Upper Reservoir", at elevation 2,307 feet, with capacity of 6,000 acre feet (located approximately two miles west of the Rowlesburg Reservoir proposed for construction by the U.S. Corps of Engineers) created by constructing dams or dykes across Buckhorn Run and a saddle dam about one mile to the east; intake structure at elevation 1,425 feet about 2,000 feet upstream from the dam on the left bank of the proposed Rowlesburg Reservoir which would serve as the lower pool; power tunnel about 2,500 feet long to a pump-generator station; power tunnel about 8,000 feet long from pump-generator station to Upper Reservoir; tailrace from pump-generator station to point on Cheat River, approximately 2 miles downstream from the Rowlesburg Dam switchyard; access roads; and other necessary appurtenances. Power generated

by the project will be used for peaking purposes in Applicant's existing transmission and distribution system.

In support of its application, Applicant has outlined the work and studies and the estimated cost of same to be undertaken under the permit, if issued. Economic and engineering studies, estimated to cost $38,000, would be made to determine the feasibility of enlargement of the power installation, location of the power station, necessity for and/or desirability of a reregulating reservoir, location of upper reservoir and alternative methods of constructing waterways, together with miscellaneous studies. In addition, Applicant advises that geological exploration undertaken to date by the U.S. Corps of Engineers for its dam on Cheat River does not furnish information to determine the feasibility of a pumped-storage reservoir and that geological exploration, including test pits, core drilling, boring and laboratory tests to determine foundation conditions of the upper dam and reservoir and properties of construction materials would be made by Applicant at an estimated additional cost of $100,000. Applicant proposes to make legal studies, at an estimated cost of $25,000, relating to contractual relations between Applicant and the Corps in connection with Applicant's use of a Government dam. Development of recreation plans is estimated by Applicant to cost $2,500. Finally, Applicant advises that if the studies outlined above show the project to be economically feasible, Applicant estimates that preparation of design drawings required to prepare and file an application for license would cost an estimated $20,000 and that preparation of plans for the acquisition of necessary lands and property rights would cost an estimated $8,000. Based upon the above information, it appears necessary that Applicant must make further economic and engineering studies under a permit, if issued, and the preparation of an application for license at a total cost estimated by Applicant to be $193,500 before an application for license can be filed. This includes an estimated expenditure of $165,500 for studies and investigations above and beyond those made by the Corps in its review study on the Rowlesburg Reservoir.

The Department of the Army and the Chief of Engineers have advised that the results of the Corps' Cheat River review study, which includes the Rowlesburg Reservoir, will be included in a report to be submitted to the Congress, and that the latter report, which will be submitted to Federal and State agencies for comment, will present a comprehensive plan for the development of the water resources of the Cheat River including the multiple purpose Rowlesburg Reservoir, and the report will consider the feasibility of hydroelectric power development, and conventional and pumped storage at the Rowlesburg site. The Corps recommended that any preliminary permit for Project No. 2477 should provide that Applicant coordinate its studies with those of the District Engineer in the interest of a comprehensive development at the Rowlesburg site.

The Department of the Interior, in commenting on the application, referred to the U.S. Corps of Engineers' pending Cheat River report to the Congress and requested that we dismiss, or defer Commission action on, the application for preliminary permit for Project No. 2477 until the Congress has had an opportunity to consider and act upon the Corps' recommendations. While the Department stated that Project No. 2477 is not expected to affect adversely the development of fishery resources in the proposed Rowlesburg Reservoir and wildlife resources are not expected to be affected significantly, the Department recommended the inclusion in any preliminary permit for the project a special condition for the purpose of planning and designing adequate conservation methods: (1) to prevent the loss or damage to existing fish and wildlife resources: (2) to mitigate and compensate for the loss of or damage to such resources; and (3) to develop and improve such resources where practicable, all as provided for in Article 10 herein.

The Department of Health, Education, and Welfare has advised, among other things, that judgment of water quality aspects of the pumped storage project cannot be made at this time due to lack of information on the project and lack of technical data related to similar projects. The Department states that a detailed study of these factors should be made prior to issuance of a license for the project.

Applicant requests a preliminary permit for a period of 36 months. It appears appropriate, however, that the initial period of the permit should be 24 months as hereinafter provided.

No construction is authorized under a preliminary permit. Such a permit gives the permittee, during the period of the permit, the right of priority of application for license over other non-federal applicants while the permittee undertakes the necessary studies and examinations required by Section 9 of the Federal Power Act in order to determine the economic feasibility of the proposed project, the means of securing the necessary financial arrangements for construction, the market for power, and all other information necessary for inclusion in an application for license, should one be applied for under the permit. A license would authorize construction of a project.

The issuance of a preliminary permit for Project No. 2477 as hereinafter provided shall not in any way be construed as precluding the exercise of Commission action contemplated under the provisions of Section 7(b) of the Federal Power Act.

The Commission finds:

(1) Applicant is a corporation organized under the laws of the State of West Virginia.

(2) Public notice of the filing of the application has been given as required by the Act. No protests have been filed. No conflicting application is before the Commission.

(3) The proposed project will affect a Government dam.

The Commission orders:

(A) This preliminary permit is hereby issued to Monongahela Power Company (Permittee) for a period of 24 months, effective as of August 1, 1965, subject to the terms and conditions of the Act, which is incorporated by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act, for the sole purpose of maintaining priority of application for license for Project No. 2477, to be located on the Cheat River in Preston County, West Virginia, and which will affect the Rowlesburg Reservoir proposed for construction by U.S. Corps of Engineers.

(B) This permit is also subject to the terms and conditions set forth in Form P–1, entitled, "Terms and Conditions of Preliminary Permit" (16 FPC 1303–1305), which terms and conditions, designated as Articles 1 through 8, are attached hereto and made a part hereof; and further subject to the following special conditions set forth herein as additional articles:

Article 9. The Permittee shall submit at the close of each six-month period from the effective date of this permit to the Regional Engineer, Federal Power Commission, New York, New York, having supervision over the project, or to such other officer as the Commission may designate, accurate statements of the work accomplished during the period and of the work contemplated under this permit for the ensuing period.

Article 10. The Permittee shall, during the period of project planning, cooperate with the U.S. Fish and Wildlife Service, the West Virginia Department of Natural Resources, and the U.S. Army Corps of Engineers for the purpose of planning and designing adequate conservation measures: (1) to prevent the loss

or damage to existing fish and wildlife resources; (2) to mitigate and compensate for the loss of or damage to these resources; and (3) to develop and improve these resources where practicable.

Article 11. The Permittee shall, during the early period of project planning, consult with Federal, State, and local agencies having an interest in outdoor recreation on project lands and waters, in the preparation of an "Exhibit R" required for the filing of an application for license pursuant to Section 4.41 of the Commission's Regulations under the Federal Power Act.

Article 12. The Permittee shall, for the purpose of assuring the cooperation required by the terms of the permit, designate a liaison officer to act for the Permittee in keeping the several agencies specified in this permit currently informed, and such liaison officer shall communicate with such agencies within 60 days from the date of issuance of this permit.

Article 13. The Permittee shall, during the period of project planning under the permit, coordinate its studies with those of the District Engineer, U.S. Army Engineer District, Pittsburgh, Pennsylvania, in order that construction and operating methods may be developed so that the Permittee's proposed project will not interfere with the comprehensive development of the Rowlesburg Reservoir site.

(C) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this preliminary permit. In acknowledgment of the acceptance of this preliminary permit, it shall be signed for the licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

NATURAL GAS PIPELINE COMPANY OF AMERICA, DOCKET NO. CP65-409

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 17, 1965)

On June 21, 1965, Natural Gas Pipeline Company of America filed in Docket No. CP65-409 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction and operation of seven injection-withdrawal wells and approximately 2.25 miles of 12-inch and 16-inch pipeline and appurtenances to be installed at its existing Herscher Storage Area, all as more fully set forth in the application.

The proposed facilities to be used in the operation of Applicant's Herscher Mt. Simon Reservoir will improve the operating efficiency of the reservoir at present levels of authorized peak day withdrawal.

The estimated cost of the proposed facilities is $835,000, which will be defrayed from funds on hand.

After due notice, no petition to intervene, notice of intervention or protest to the granting of the application has been filed.

At a hearing held on August 12, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits submitted in support of the authorization, and upon consideration of the record,

The Commission finds:

(1) Applicant, Natural Gas Pipeline Company of America, a Delaware corporation having its principal place of business in Chicago, Illinois, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of November 7, 1958, in Docket No. G–9966 (20 FPC 694).

(2) The proposed construction and operation of facilities, by Applicant as hereinbefore described, and as more fully described in the application and exhibits in this proceeding, are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(3) The aforesaid proposed construction and operation of facilities by Applicant are required by the public convenience and necessity and a certificate therefor should be issued as hereinafter ordered and conditioned.

(4) Applicant is able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act, and requirements, rules and regulations of the Commission thereunder.

(5) Public convenience and necessity require that the certificate issued hereinafter and the rights granted thereunder be conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act, and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued to the Applicant in this proceeding authorizing the construction and operation of facilities as more fully described in the application and exhibits in this proceeding, subject to the jurisdiction of the Commission, upon the terms and conditions of this order.

(B) The certificate issued by paragraph (A) above and the rights granted thereunder are conditioned upon Applicant's compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(3), (c)(4) and (e) of Section 157.20 of such Regulations.

(C) The facilities authorized shall be completed and in actual operation, as provided by paragraph (b) of Section 157.20 of the aforesaid Regulations within 12 months of the date on which this order issues.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

TEXAS GAS TRANSMISSION CORPORATION, DOCKET NO. CP65–185 AND LAWRENCEBURG GAS TRANSMISSION CORPORATION, DOCKET NO. CP65–186

FINDINGS AND ORDER AFTER STATUTORY HEARING ISSUING CERTIFICATES OF PUBLIC CONVENIENCE AND NECESSITY AND PERMITTING AND APPROVING ABANDONMENT

(Issued August 17, 1965)

On December 22, 1964, Lawrenceburg Gas Transmission Corporation (Transmission) filed in Docket No. CP65–186 an application pursuant to Section 7(c) of the Natural Gas Act for a certificate of public convenience and necessity authorizing the construction, acquisition and operation of certain natural gas

facilities and the sale and delivery of natural gas, on a firm basis, to Lawrenceburg Gas Company (Lawrenceburg Gas) for resale and, on an interruptible basis, to Cincinnati Gas & Electric Company (Cincinnati)[1] for resale, all as more fully set forth in the application in Docket No. CP65–186.

Specifically, Transmission proposes (1) to acquire from Lawrenceburg Gas and operate the regulating facilities located at one of the two existing taps on Texas Gas Transmission Corporation's (Texas Gas) 26-inch transmission line in Dearborn County, Indiana, through which Texas Gas now serves Lawrenceburg Gas at wholesale, the regulating facilities at the second such tap already being the property of Transmission; (2) to construct and operate automatic flow control facilities at the taps described above for the control of deliveries by Transmission to Lawrenceburg Gas and Cincinnati, and, (3) to construct and operate approximately two miles of 8-inch transmission line from Transmission's existing facilities in Dearborn County, Indiana, extending eastwardly to a point in Hamilton County, Ohio, and a measuring and regulating station at the end of such line, for the purpose of making the proposed interruptible deliveries to Cincinnati. Transmission will operate such facilities, together with its other existing facilities, to sell and deliver natural gas to Lawrenceburg Gas at a contract demand of 10,500 Mcf per day until November 1, 1965, and at a contract demand of 11,000 Mcf per day thereafter, and to sell and deliver natural gas, on an interruptible basis, to Cincinnati. Transmission estimates deliveries to Cincinnati to be 1,600,000 Mcf annually.

Transmission presently transports gas within the State of Indiana for Lawrenceburg Gas which gas the latter purchases from Texas Gas under Texas Gas' FPC Gas Rate Schedule G–4. Lawrenceburg Gas distributes such gas in the Cities of Lawrenceburg and Greendale, Indiana, and environs, and also sells gas to Transmission for resale to the city of Aurora, Indiana. The contract demand of Texas Gas for Lawrenceburg Gas is presently 10,500 Mcf; such contract demand increases to 11,000 Mcf beginning November 1, 1965.[2] Under the subject proposal, Transmission, in effect, will be substituted for Lawrenceburg Gas as purchaser from Texas Gas and will enter into a new service agreement under Texas Gas' FPC Gas Rate Schedule CD–4 and will purchase the same contract demand volumes to which Lawrenceburg Gas is presently entitled. The interruptible volumes proposed to be sold to Cincinnati will be a portion of the gas supply presently available to, but not fully utilized by, Lawrenceburg Gas; only gas in excess of the requirements of Lawrenceburg Gas will be made available to Cincinnati. In addition to continuing service to Greendale and Lawrenceburg, Lawrenceburg Gas will provide the service which Transmission is presently rendering to Aurora.

The application indicates that the proposal will result in savings to Lawrenceburg Gas and Transmission since, as a result of the interruptible sale to Cincinnati, average daily purchases from Texas Gas will be increased from approximately 50 percent of contract demand to approximately 100 percent of contract demand thereby reducing the average unit cost of gas. Further, the connection of the facilities of Transmission with those of Cincinnati will provide another source of supply for Cincinnati in the western part of its service area, at a point, Transmission states, where Cincinnati needs additional supplies of gas.

---

[1] Cincinnati is the parent company of both Transmission and Lawrenceburg Gas.

[2] These contract demand volumes were authorized by Commission order issued May 26, 1964, in Docket No. CP64–107 (31 FPC 1292).

Transmission, Lawrenceburg Gas, Texas Gas and Cincinnati have entered into an agreement, dated December 10, 1964, providing for the subject proposals.

The application indicates that the facilities to be acquired will be transferred from Lawrenceburg Gas to Transmission at original cost less depreciation. The estimated cost of the facilities to be constructed is $79,550, which cost will be financed with cash on hand.

On December 22, 1964, Texas Gas filed in Docket No. CP65–185 an application pursuant to Sections 7(b) and 7(c) of the Natural Gas Act for authority to abandon the sale of natural gas to Lawrenceburg Gas and for a certificate of public convenience and necessity authorizing the sale and delivery of natural gas to Transmission all as hereinabove described and as more fully set forth in the application in Docket No. CP65–185.

Texas Gas states that no increase in maximum daily delivery obligation above that already authorized for Lawrenceburg Gas is involved and that no new facilities are required by Texas Gas under the subject proposal. Further, no new rates or changes in the rates of Texas Gas are proposed.

On February 8, 1965, Kentucky Gas Transmission Corporation and The Ohio Fuel Gas Company filed a joint petition to intervene in Docket No. CP65–186; however, on May 18, 1965, said joint petition was withdrawn.

After due notice, no other petition to intervene, notice of intervention or protest to the granting of the applications has been filed.

At a hearing held on August 12, 1965, the Commission on its own motion received and made a part of the record in these proceedings all evidence, including the applications and exhibits submitted in support of the authorizations sought herein, and upon consideration of the record,

The Commission finds:

(1) Applicant, Texas Gas Transmission Corporation, a Delaware corporation having its principal place of business in Owensboro, Kentucky, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order of March 30, 1949, in Docket No. G–859 (8 FPC 190).

(2) Applicant, Lawrenceburg Gas Transmission Corporation, an Indiana corporation having its principal place of business in Lawrenceburg, Indiana, upon completion of the construction and acquisition of the facilities and the commencement of operation thereof for which authorization is requested in Docket No. CP65–186, will be engaged in the transportation and sale of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and will be, therefore, a "natural-gas company" within the meaning of the Natural Gas Act.

(3) The facilities hereinbefore described, as more fully described in the application in Docket No. CP65–186, are to be used in the transportation and sale of natural gas in interstate commerce, subject to the jurisdiction of the Commission, and the construction, acquisition and operation thereof and the proposed transportation and sales of natural gas by Transmission are subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(4) The proposed sale of natural gas hereinbefore described, as more fully described in the application in Docket No. CP65–185, will be in interstate commerce, subject to the jurisdiction of the Commission, and such sale by Texas Gas is subject to the requirements of Subsections (c) and (e) of Section 7 of the Natural Gas Act.

(5) The proposed construction, acquisition and operation of the subject facilities by Transmission and the proposed transportation and sales of natural gas by

Transmission and Texas Gas are required by the public convenience and necessity and certificates therefor should be issued as hereinafter ordered and conditioned.

(6) The sale of natural gas to be abandoned by Texas Gas, as hereinbefore described, is subject to the jurisdiction of the Commission and the abandonment of such sale is subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(7)) Such abandonment by Texas Gas, as hereinbefore described, is permitted by the public convenience and necessity and an order authorizing and approving same should be issued as hereinafter ordered.

(8) Applicants are able and willing properly to do the acts and to perform the service proposed and to conform to the provisions of the Natural Gas Act and the requirements, rules and regulations of the Commission thereunder.

(9) Public convenience and necessity require that the certificates issued hereinafter and the rights granted thereunder be conditioned upon Applicants' compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4), (d)(2), (d)(3) and (e) with respect to Transmission and in paragraphs (a), (b), (c)(3) and (e) with respect to Texas Gas, of Section 157.20 of such Regulations.

The Commission orders:

(A) A certificate of public convenience and necessity is issued authorizing Applicant, Texas Gas Transmission Corporation, to sell and deliver natural gas, as hereinbefore described, all as more fully described in the application in Docket No. CP65–185, upon the terms and conditions of this order.

(B) A certificate of public convenience and necessity is issued authorizing Applicant, Lawrenceburg Gas Transmission Corporation, to construct, acquire and operate the subject facilities and to sell and deliver natural gas, as hereinbefore described, all as more fully described in the application in Docket No. CP65–186, upon the terms and conditions of this order.

(C) The certificates issued by paragraphs (A) and (B) above and the rights granted thereunder are conditioned upon Applicants' compliance with all applicable Commission Regulations under the Natural Gas Act and particularly the general terms and conditions set forth in paragraphs (a), (b), (c)(1), (c)(3), (c)(4), (d)(2), (d)(3) and (e) with respect to Transmission and in paragraphs (a), (b), (c)(3) and (e) with respect to Texas Gas, of Section 157.20 of such Regulations.

(D) The facilities authorized to be acquired, constructed and operated by Transmission shall be acquired, constructed and placed in actual operation and the proposed sales and delivery of natural gas authorized in paragraphs (A) and (B) above shall commence, as provided by paragraph (b) of Section 157.20 of the Commission's Regulations under the Natural Gas Act within 6 months from the date on which this order issues.

(E) The certificate issued by paragraph (B) above is granted on the express condition that the interruptible service authorized thereby shall be curtailed or interrupted to the extent required to meet existing or future contracted maximum delivery obligations of Transmission for firm service to its customers.

(F) The certificate issued by paragraph (B) is granted on the express condition that Transmission file a tariff that is acceptable to the Commission.

(G) Permission for and approval of the abandonment by Texas Gas of the sale of natural gas hereinbefore described, all as more fully described in the application in Docket No. CP65–185, is granted.

(H) Texas Gas shall advise the Commission of the date of said abandonment within 10 days of the date thereof.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

UNITED GAS PIPE LINE COMPANY, DOCKET NO CP65-413

FINDINGS AND ORDER AFTER STATUTORY HEARING PERMITTING AND APPROVING ABANDONMENT

(Issued August 17, 1965)

On June 23, 1965, United Gas Pipe Line Company (Applicant) filed in Docket No. CP65-413 an application pursuant to Section 7(b) of the Natural Gas Act for permission and approval to abandon certain natural gas facilities, all as more fully set forth in the application.

Applicant proposes to abandon the following described facilities which were used to serve the customers indicated: (1) Scurlock Oil Company Bean (Fowler) Pump Station consisting of a positive meter and regulator station located in Claiborne Parish, Louisiana, (2) Pittsburgh Plate Glass Company Chemical Division consisting of approximately 0.3 mile of 2-inch line and positive meter and regulator station located in Santa Rosa County, Florida, (3) Service Pipe Line Company Willis Smith Pump Station consisting of a positive meter station located in Gregg County, Texas, and, (4) Bluff Creek Industries consisting of a positive meter, regulator and 25 feet of 2-inch pipe located in Jackson County, Mississippi.

Applicant states that the respective service agreements with its customers have been cancelled by mutual agreement and the facilities are no longer required. Applicant states that service to its remaining customers will not be affected.

After due notice, no petition to intervene, notice of intervention, or protest to the granting of the application has been filed.

At a hearing held on August 12, 1965, the Commission on its own motion received and made a part of the record in this proceeding all evidence, including the application and exhibits, submitted in support of the authorization sought, and upon consideration of the record,

The Commission finds:

(1) Applicant, United Gas Pipe Line Company, a Delaware corporation having its principal place of business in Shreveport, Louisiana is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in the order issued November 10, 1942, in Docket No. G-232 (3 FPC 863).

(2) The facilities proposed to be abandoned, as hereinbefore described and as more fully described in the application herein, are used in the transportation of natural gas in interstate commerce subject to the requirements of Subsection (b) of Section 7 of the Natural Gas Act.

(3) The proposed abandonment of the aforesaid facilities is permitted by the public convenience and necessity and approval thereof should be granted as hereinafter ordered.

The Commission orders:

(A) Permission for and approval of the abandonment of the facilities hereinbefore described, as more fully described in the application in this proceeding, are granted to Applicant, United Gas Pipe Line Company.

(B) Applicant shall advise the Commission of the date of abandonment of the facilities as authorized in paragraph (A) above within 10 days of such abandonment.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

DELTA NATURAL GAS COMPANY, INC. AND TENNESSEE GAS TRANSMISSION COMPANY, DOCKET NO. CP65-390

FINDINGS AND ORDER DIRECTING PHYSICAL CONNECTION OF FACILITIES AND SALE OF NATURAL GAS

(Issued August 18, 1965)

On June 7, 1965, Delta Natural Gas Company, Inc. (Applicant), filed in Docket No. CP65-390 an application together with a supplement thereto on June 28, 1965, pursuant to Section 7(a) of the Natural Gas Act for an order of the Commission directing Tennessee Gas Transmission Company (Respondent) to establish physical connection of its natural gas transmission facilities with the facilities proposed to be constructed by Applicant, and to sell and deliver natural gas to Applicant for resale and distribution in the unincorporated town of Jeffersonville, Montgomery County, Kentucky, and environs, all as more fully set forth in the application.

Applicant proposes to construct and operate a distribution system in Jeffersonville, Kentucky, and environs thereof. The requested point of interconnection with the system of the Respondent is within the limits of Applicant's service area, and no transmission facilities are necessary. Applicant's natural gas requirements for the requested service are estimated as follows:

	First year	Second year	Third year
Annual (Mcf)	15,770	17,330	19,020
Peak day (Mcf)	184	203	223

The total cost of Applicant's proposed construction is estimated at $35,887, and will be defrayed from Applicant's current operations. The supplementary data filed on June 28, 1965, together with the data reflected in the application indicate the proposals with reference to Jeffersonville are economically feasible.

On June 21, 1965, Respondent filed an answer to the application in the proceeding stating it does not oppose the granting of the application and can render the requested service without impairment of existing service to its current customers.

The Kentucky Public Service Commission has approved the pending application proposals of the Applicant made in the instant application.

Due notice of the filing of the subject application and opportunity for hearing thereon have been given by publication in the Federal Register on June 17, 1965 (30 F.R. 7849). No protest, petition to intervene, notice of intervention or request for hearing has been filed in this proceeding.

The Commission finds:

(1) Tennessee Gas Transmission Company, a Delaware corporation having its principal place of business in Houston, Texas, is a "natural-gas company" within the meaning of the Natural Gas Act, as heretofore found by the Commission in its order issued July 15, 1965, in Docket No. G-910 (6 FPC 777).

(2) Applicant, Delta Natural Gas Company, Inc., having its principal place of business in Winchester, Kentucky, is legally authorized to engage in the local distribution of natural gas to the public within the meaning of Section 7(a) of the Natural Gas Act.

(3) It is necessary and desirable in the public interest to direct Respondent to establish physical connection of its transmission facilities with the facilities proposed to be constructed and operated by Applicant, and to sell and deliver to Applicant under a service agreement to be executed by Applicant with Respondent in accordance with the Commission's Regulations, up to 223 Mcf per day of natural gas for distribution and resale as hereinbefore described and as more fully described in the application in this proceeding.

(4) Applicant should be prepared to receive natural gas from Respondent for distribution in Jeffersonville, Kentucky and environs, within one year from the date of the issuance of this order.

(5) The requirement that Respondent serve Applicant, as requested, will not place an undue burden upon it nor impair its ability to render adequate service to its existing customers.

The Commission orders:

(A) Tennessee Gas Transmission Company, Respondent, is directed to establish physical connection of its facilities with the facilities proposed to be constructed and operated by Applicant, as herein described, and to sell and deliver up to 223 Mcf of natural gas daily to Applicant under a service agreement to be executed by Applicant with Respondent in accordance with the Commission's Regulations, for distribution and resale as hereinbefore described and as more fully described in the application in this proceeding. Such service shall be rendered pursuant to Tennessee's presently filed appropriate rate schedule.

(B) Respondent shall report to the Commission in writing the date of commencement of service to Applicant within 10 days thereof.

(C) Applicant shall be prepared to receive service as directed herein within one year from the date of issuance of this order.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

FIRST TRANSPORTATION GAS CORPORATION, INC., DOCKET NO. CI61-985

ORDER DENYING MOTION REQUESTING IMMEDIATE HEARING AND ISSUANCE OF A PERMANENT CERTIFICATE OF PUBLIC CONVENIENCE AND NECESSITY

(Issued August 18, 1965)

The First Transportation Gas Corporation, Inc. (First Transportation) on June 24, 1965, filed a motion requesting immediate hearing and issuance of a permanent certificate of public convenience and necessity in Docket No. CI61-985 authorizing the sale of natural gas to Transwestern Pipeline Company (Transwestern) from certain leases in Lipscomb and Ochiltree Counties, Texas and Beaver, Harper, Ellis and Woodward Counties, Oklahoma. By letter dated February 2, 1961, the Commission granted a conditioned temporary authorization to First Transportation, which was accepted, to make the requested sale at an initial price of 17.0 cents per Mcf at 14.65 psia. On July 2, 1965, Transwestern filed an answer in opposition to the motion of First Transportation.

Most of the Transwestern facilities which receive and transport the First Transportation gas are pending permanent certification in the consolidated proceedings in Transwestern Pipeline Company, *et al.*, Docket No. G-20464, *et al.* As we pointed out in our previous order issued November 24, 1964, 32 FPC 1362, in this docket denying First Transportation's motion for permanent certificate, to

grant the producers permanent certificates before the pipeline facilities are themselves permanently certificated would be prejudging the proceedings in Docket No. G–20464, *et al.* First Transportation contends that the examiner in his decision in Docket No. G–20464, *et al.*, *infra*, p. 668, found that the facilities of Transwestern which receives First Transportation's gas (as well as gas from certain other producers) are "used and required" exclusive of Transwestern's proposed sale to Cities Service Gas Company in the consolidated proceedings. First Transportation therefore maintains that these facilities are separable and should not await the determination of the competitive aspects but should be certificated immediately. However, even though the facilities in question may be used and required exclusive of the sales to Cities Service, it is contended in the consolidation proceedings that they will also be used in conjunction with the proposed sale to Cities Service. Obviously, these facilities may directly affect Transwestern's operations with or without the proposed sale to Cities Service and should be considered in relation thereto. In addition, since the proceedings in Docket No. G–20464, *et al.* involve competitive proposals, we believe any action with respect to any individual dockets therein should await our final decision in the consolidated proceedings which are presently pending before the Commission. First Transportation can continue to make the sale as temporarily authorized but any action on its permanent certificate must await the outcome in the consolidated proceedings in Docket No. G–20464, *et al.*

The Commission orders:

For the foregoing reason the motion of First Transportation for immediate hearing and issuance of a permanent certificate of public convenience and necessity in Docket No. CI61–985 is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross, David S. Black and Carl E. Bagge.

VILLAGE OF GRESHAM, WISCONSIN, PROJECT NO. 2464

ORDER DENYING APPLICATION FOR REHEARING

(Issued August 18, 1965)

On August 3, 1965, Intervenors, Jack Brown, Harry Schmidt and Charles Brown, filed an application for rehearing with respect to our Opinion No. 466, issued July 13, 1965, 34 FPC 33, in which we granted the application of the Village of Gresham, Wisconsin, for license to construct Project No. 2464, consisting of the Weed Dam, and powerhouse on the Red River in Wisconsin approximately a mile downstream from the Village.

The application for rehearing states that further temperature tests and tests of sewage affluent are now available, and also urges reconsideration of the effects the proposed project will have on fluctuation of flows in the Red River below the dam.

These issues, as well as other material issues referred to in the application for rehearing, have been thoroughly considered in our decision of July 13, 1965, and the new evidence which has become available since the hearing record was closed does not appear to be substantially different from that considered in the record. After careful reconsideration of the matters raised, we adhere to our decision issued July 13, 1965. The application for rehearing will be denied.

The Commission orders:

The application for rehearing of Opinion No. 466 is denied.

Chairman Swidler and Commissioner Ross *dissenting.*

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., David S. Black and Carl E. Bagge.

CENTRAL MAINE POWER COMPANY, PROJECT NO. 2519

ORDER DENYING PETITION FOR DECLARATORY ORDER, AND GRANTING MOTION TO VACATE THE FILING OF LICENSE APPLICATION

(Issued August 19, 1965)

Petitioner Central Maine Power Company of Augusta, Maine, on April 19, 1965, filed with the Commission a petition for declaratory order declaring that the Commission is without licensing jurisdiction over Petitioner's constructed North Gorham project located in the Presumpscot River in the Towns of Gorham and Windham, Maine. Appended to this petition was an application for license for the North Gorham hydroelectric development. The petition and the application were received and filed as an application for license and designated Project No. 2519. Public notice of the application was given on May 10, 1965.

Petitioner, by motion filed May 20, 1965, requests that the Commission "vacate the Notice of Application issued May 10, 1965, in the above-designated proceeding and * * * vacate any other actions taken by the Commission that reflect a filing of an application in the above-designated proceeding * * *." In support of its motion, Petitioner declares that it did not intend that the license application be filed unless and until the Commission, in acting upon the petition for declaratory order, decided that the Presumpscot River was subject to the Commission's licensing jurisdiction and this finding had been upheld on judicial review. Since the Petitioner did not submit the application for filing prior to a declaratory order, petitioner moves that such filing be vacated. We are of the opinion that this motion should be granted.

Petitioner also asks that the Commission "act upon Central Maine's Petition for a Declaratory Order Concerning the Presumpscot River, dated April 15, 1965, and filed with the Commission on or about April 19, 1965." Petitioner states that its request for a declaratory order was filed pursuant to Section 1.7(c) of the Commission's Rules of Practice and Procedure. Subsection 1.7(c) provides *inter alia* that such petitions "* * * shall include a complete statement of the facts and grounds prompting the petition." Petitioner's filing has failed to satisfy this requirement.

The objective of Section 1.7(c) of the Rules of Practice and Procedure is to eliminate the necessity for a further factual investigation and a hearing. The spirit and objective are defeated by a negative or an insubstantial factual statement in a petition for a declaratory order concerning the questions presented.

The petition for declaratory order in this case contains only an insubstantial statement of jurisdictional facts with regard to the status of the project. The issuance of declaratory orders is controlled by the exercise of sound discretion (Administrative Procedure Act, Subsection 5(d)), and this Commission will decline to issue such orders unless Petitioner supplies a statement of facts upon which a reasoned decision may be based. The requirement that the petitioner furnish a full and complete statement of relevant facts is eminently reasonable where, as here, petitioner and its direct predecessors in interest have been situated on the stream since before the turn of the century and, as a result, are in a position to ascertain the jurisdictional facts, including those relating to the navigability of the stream.

The Commission finds:

It is appropriate and in the public interest to grant Central Maine Power Company's motion to vacate the filing of the application for the North Gorham project and to deny Central Maine Power Company's petition for a declaratory order.

The Commission orders:

(A) Central Maine Power Company's motion, filed May 20, 1965, to vacate the filing of the license application for Project No. 2519 is hereby granted.

(B) Central Maine Power Company's petition, filed April 19, 1965, for a declaratory order concerning the Commission's licensing jurisdiction with respect to the North Gorham project, is hereby denied.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

NATURAL GAS COMPANIES—EMERGENCY PLANNING—ANNUAL REPORTS OF SYSTEM FLOW DIAGRAMS, DOCKET NO. R-257

ORDER NO. 303

AMENDING PART 260 OF REGULATIONS UNDER THE NATURAL GAS ACT

(Issued August 19, 1965)*

This proceeding was initiated by a notice of proposed rulemaking issued February 12, 1964, published in the Federal Register (29 F.R. 2512, February 15, 1964), and sent to all natural gas companies and other parties, including federal and state agencies who might be interested. The Commission on January 7, 1965, issued an amended notice published in the Federal Register (30 F.R. 447, January 13, 1965), to make clear that the information called for by the new reporting requirements would be used by the Federal Power Commission for general regulatory purposes as well as for defense emergency planning purposes.

The material required to be filed will fill an existing gap in the information needed concerning recent actual operations of the large pipeline companies on peak days and on average days. The flow diagrams filed with certificate applications for major expansions show the actual operations as of a date just prior to filing the application, and an estimate of future operations if the application is granted. These applications, however, are filed intermittently, not on a regular annual basis; the estimates may be and frequently are amended before the facilities are installed. Thus, the certificate application flow diagrams in the Commission's files are not up-to-date and presumably are not entirely accurate as related to the systems actually constructed.

The proposed diagrams will assist the Commission in securing accurate data on cost and means of transporting gas because the distance of haul as well as peak day and average day volumes carried will be available on a year-to-year basis, to supplement estimates filed in new certificate applications.

The Commission received comments from fifteen pipeline companies representing 24 corporate systems and the Independent Natural Gas Association of America in response to its notice and amended notice.

The Commission, in accordance with section 4(b) of the Administrative Procedure Act, has taken into consideration the views of the various persons who responded and has modified its original proposal to accommodate many of those views.

---

*Published in the Federal Register on August 27, 1965 (30 F.R. 11101). See order issued October 14, 1965 granting reconsideration, etc., 34 FPC 1158. Order No. 303-A, issued May 10, 1966 prescribes a revised § 260.8(b) effective for the reporting year 1965, 35 FPC 712.

The principal objections to the proposed regulation were that (1) no useful purpose would be served by furnishing the information; (2) certain items duplicate information now on file with the Commission; (3) the regulations have technical infirmities and (4) the reporting period should be a calendar year.

We do not accept the argument that no useful purpose would be served by the furnishing of the information. The Commission believes that this information is necessary for regulatory purposes. We realize that information of this type is submitted with certificate filings, but such information is necessarily incomplete in that it is filed intermittently, often for less than the entire pipeline system, and consists of estimated flow, not actual recorded flow.

We have revised all of the subparagraphs in the proposed § 260.8(a) except (1), (5), and (8) (now (9)), in response to comments by companies in order to remove ambiguities and make the requested information more meaningful. The reporting period has been changed from a fiscal year to a calendar year as suggested by several companies. This will allow the companies to more closely correlate the information with other information normally supplied to the Commission in Forms 2 and 11.

Other revisions made in response to company suggestions include (1) the requirement that only Class A companies with a system delivery capacity in excess of 100,000 Mcf per day (at 14.73 psia and 60° F.) shall be required to file as opposed to all Class A and B companies as was originally proposed; (2) companies which do not use the American Standards Association standards may use in their report their own standards of maximum permissible operating pressure provided that the company supplies an explanation of the standard used; and (3) deliveries of less than 100 Mcf per day may be grouped for reporting purposes in an appropriate manner rather than separate reporting for each delivery take-off point.

One item of information which the present regulations provide for in a different form than that originally noticed is the data on system input. As originally proposed the regulations asked for the maximum daily volume receivable at each intake point. We have concluded that such data is too indefinite in that it requires an assumption of pressure conditions. As a substitute, subparagraphs (13) and (14) require reporting of the average daily volume received at each intake point to the transmission pipeline system as well as the volume received at such points on the day of maximum coincidental delivery. Information is furnished in Form 2 regarding annual purchases (which is convertible to average daily volume) but is not related to points of input to the transmission system. To interpret the information, for cost as well as flow purposes, a diagram giving the requested information is necessary. To the extent that the information now required is also information furnished for the different purposes of Form 2, it should not be burdensome to the reporting company.

The Commission finds:

(1) The amendments herein adopted are necessary and appropriate for the administration of the Natural Gas Act.

The Commission, acting pursuant to the provisions of the Natural Gas Act, as amended, particularly sections 4, 5, 7 and 16 thereof (52 Stat. 823–825, 830 (1938); 15 U.S.C. 717c, 717d, 717f, 717o), and in furtherance of Executive Order 11095, *orders:*

(A) Part 260, Statements and Reports, Suchapter G, Chapter I, Title 18 of the Code of Federal Regulations, is amended by adding a new § 260.8 to read as follows:

§ 260.8 System flow diagrams.

(a) Each Class A natural gas pipeline company, having a system delivery

capacity in excess of 100,000 Mcf per day (measured at 14.73 psia and 60° F.), shall file with the Commission by June 1 of each year twelve (12) copies of a diagram or diagrams reflecting operating conditions on its main transmission system during the previous twelve months ended December 31. For purposes of system peak deliveries, the heating season overlapping the year's end shall be used. Facilities shall be those installed and in operation on December 31 of the reporting year. All volumes shall be reported on a uniform stated pressure and temperature base.

(b) The diagram or diagrams shall include the following items of information:

(1) Nominal diameter (inches) of each pipeline.

(2) Length (miles to nearest 0.1 mile) of each pipeline between points of intake, delivery, river crossings, storage fields, cross-overs, compressor stations and interconnections with other pipeline companies.

(3) Direction of flow in the pipelines. If direction of flow can be reversed at compressor stations, so indicate.

(4) Maximum permissible operating pressure for each pipeline at discharge side of each compressor station, or other critical point, determined by the provisions set forth in the American Standards Association publication B 31.8 "Gas Transmission and Distribution Piping Systems." or by the company's own standard, provided that the company supplies an explanation of the standard used. Where company standard governs, so designate by appropriate symbol or legend.

(5) Size (horsepower), type (reciprocal, centrifugal turbine, electric motor, gas) and number of installed compressor units at each compressor station.

(6) Designed suction pressure for each compressor station, psig.

(7) Designed discharge pressure for each station, psig.

(8) Maximum volume, Mcf per day that can be compressed at each compressor station under conditions of suction and discharge set forth in (6) and (7) above. If direction of flow affects these factors, provide the information for each direction of flow.

(9) The fuel requirement at each compressor station under conditions described in (8).

(10) Normal average line pressure at points of interconnection with other pipeline companies and volumes, that can be delivered or received at such points under normal operating conditions. Give the name of the interconnecting company.

(11) For each storage field connected to the system and operated by the respondent pipeline company, the maximum daily and seasonal withdrawal volumes available under normal conditions of operation.

(12) The average and maximum (coincidental and noncoincidental) daily volumes delivered at each take-off point during the reporting year. Small deliveries (less than 100 Mcf per day) which have little or no effect upon the operation of the pipeline may be grouped in an appropriate manner, *i.e.*, between compressor stations or the last mainline compressor station and the end of the pipeline. If an estimate is used for a delivery, so indicate.

(13) The average daily volume received at each intake point to the transmission pipeline system.

(14) The volume received into the transmission pipeline system at each intake point on the day of maximum coincidental delivery.

The information required by subparagraphs (12), (13), and (14) may be furnished in tabular form providing that it is suitably keyed to the diagram(s) by appropriate identifying symbol or number.

(c) Flow diagrams depicting 1964 operations shall be filed by November 15, 1965.

* * * * * * *

[Secs. 4, 5, 7, 16; 52 Stat. 823, 824, 825, 830; 15 U.S.C. 717c, 717d, 717f, 717o.]

(B) This amendment shall become effective on October 1, 1965.

(C) The Secretary shall cause prompt publication of this order to be made in the Federal Register.

Before Commissioners: Joseph C. Swidler, Chairman; L. J. O'Connor, Jr., Charles R. Ross and Carl E. Bagge.

ROCKY MOUNTAIN POWER COMPANY, PROJECT NO. 2289

ORDER FIXING HEARING

(Issued August 19, 1965)

By application originally filed on January 5, 1961, and supplemented on April 19, 1961, the Applicant, Rocky Mountain Power Company, proposed a project consisting of two conventional hydroelectric developments, called the Sweetwater and Dotsero power plants, having a combined installed capacity of 150,000 kilowatts, and located in Garfield, Eagle and Rio Blanco counties, Colorado. Public notice of this application was issued on June 1, 1961.

On May 4, 1962, the application was supplemented by a brief filing which proposed a substantially different alternative project. This was to be a mixed conventional and pumped storage project with an initial installed capacity of 165,000 kilowatts and an ultimate installed capacity of 705,000 kilowatts. By the Secretary's letter of May 31, 1962, the Applicant was asked to file its new proposal as a formal amendment of its application with fully developed accompanying exhibits.

Applicant filed this amendment on March 22, 1963. In this filing it proposed the project for construction in three stages. At the initial stage, the Sweetwater power plant was to have an installed capacity of 165,000 kilowatts; at the second stage, this was to be increased to 330,000 kilowatts; at the final stage, it was to be raised to 495,000 kilowatts, and the Dotsero power plant was to be installed with 210,000 kilowatts, for a combined ultimate development of 705,000 kilowatts, between four and five times the installed capacity of the project as originally proposed.

Because the extensive amending of the original application had caused uncertainty as to the details of the proposal as it then stood, the Applicant was requested by the Secretary's letter of July 29, 1963, "to assemble in a unified and revised application for a license, all the data and information on the proposed alternative project which have been filed with the Commission on various dates as exhibits or supplemental data." Applicant filed its revised application for the first and second stages of its proposed development on December 23, 1963, and November 30, 1964, and for the third stage on December 31, 1964. Public notice of the application, as revised and amended, was given on May 11, 1965. However, the application is still deficient as to information regarding the financing of the project, and as to information on availability of markets for electric power, and the Applicant has been requested to remedy these deficiencies. Petitions to intervene have been filed by the Colorado Public Utility Commission, Humble Oil & Refining Company, Public Service Company of Colorado, Western Colorado Power Company and Utah Power & Light Company, and numerous informal protests regarding the possible effect of the project on the Flat Tops Primitive Area have been received.

In view of the importance and complexity of the issues raised by Rocky Mountain Power Company's application and the petitions to intervene, a public hearing would be desirable.

The Commission finds:

It is appropriate and in the public interest to hold a public hearing, as hereinafter provided.

The Commission orders:

(A) Pursuant to the authority contained in and subject to the jurisdiction conferred upon the Federal Power Commission by the Federal Power Act, particularly Sections 4(e), 10(a) and 308 thereof, and the Commission's Rules of Practice and Procedure, a public hearing shall be held on May 23, 1966, at 10:00 a.m. in a hearing room of the Federal Power Commission, 441 G Street, N.W., Washington, D.C. respecting the matters involved and the issues presented in this proceeding.

(B) The following procedure is prescribed for this proceeding:

1. The Applicant shall file by March 1, 1966, with the Secretary of the Commission an original and ten copies of all testimony, including qualifications of the witnesses, and exhibits to be presented in Applicant's direct case.

2. The Applicant's filing shall include a full and complete statement of a definite plan for the financing of the project, and a full and complete statement of definite plans for the marketing of the electric power to be produced by the project. Failure to comply with this directive will constitute a basis for a motion to dismiss the application for a license for lack of completeness.

3. All other parties, including the Commission staff, shall file by April 29, 1966, with the Secretary, an original and ten copies of all direct testimony and exhibits including qualifications of witnesses.

4. All motions to strike shall be filed with the Presiding Examiner by May 9, 1966, with replies to such motions to be filed by May 16, 1966.

5. All of the testimony, except exhibits, shall be in question and answer form.

6. No exhibits, except those of which official notice may properly be taken, shall contain narrative material other than brief explanatory notes.

7. Any party submitting more than one exhibit shall enclose a cover sheet listing the title of each exhibit in the sequence they are to be marked for identification.

8. The Presiding Examiner will specify the order of cross-examination and time to be permitted for preparation of rebuttal evidence.

(C) The Commission's Rules of Practice and Procedure shall apply in this proceeding except to the extent that they are modified or supplemented herein.

Commissioner Ross *dissenting.*

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

VERMONT MARBLE COMPANY, PROJECT NO. 2445

ORDER ISSUING LICENSE (MINOR)

(Issued August 19, 1965)

Application was filed on February 17, 1964, by Vermont Marble Company (Applicant) of Proctor, Vermont, for a license under Section 4(e) of the Federal Power Act for constructed minor Project No. 2445, known as the Center Rutland

Project, located on Otter Creek in the Town of Rutland, Rutland County, Vermont. The project does not affect lands of the United States.

The project commenced operation in 1898 and has remained essentially the same since that date.

Available historical evidence shows that Otter Creek, from its source in Lake Champlain to a point upstream at least 35 miles above the Center Rutland Project was used extensively for water transportation by the early settlers of the region.

The Chief of Engineers and the Secretary of the Army have advised that the plans of the project structures affecting navigation are satisfactory.

The Department of the Interior has advised that wildlife resources are not affected significantly by the project and the project does not adversely affect fish resources, and no fishway or other specific measures are necessary for inclusion in any license for the project.

The Department of Health, Education, and Welfare has advised that the project does not have any adverse effects on water quality.

In our order on rehearing issued February 17, 1965, in *Wisconsin Power & Light Company, Project No. 2347, et al.*, 33 FPC 275, we stated that we would have no objection to the issuance of licenses for minor projects without waiving Sections 14 and 15 of the Federal Power Act and the other provisions of the Act necessary to the effectuation of those sections, provided the minor project applications are timely supplemented pursuant to Section 4.50 of our Regulations under the Act (18 CFR § 4.50), which relates to applications for major projects. In the event the Applicant herein wishes a license in which those provisions of the Act are not waived it should so advise us within 30 days from the date of issuance of this order and file its supplemental application within 30 additional days thereafter.

For the reasons set forth in our April 25, 1962, Opinion No. 357 (27 FPC 830), the license herein granted shall have an effective date of April 1, 1962, and a termination date of December 31, 1993.

The Commission finds:

(1) Otter Creek from its mouth in Lake Champlain to a point upstream at least 35 miles above the Center Rutland Project constitutes navigable waters of the United States.

(2) The Center Rutland Project affects navigable waters of the United States.

(3) Applicant is a corporation organized under the laws of the State of Vermont, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the project.

(4) Public notice of the filing of the application has been given. No protests or petitions to intervene have been received. No conflicting application is before the Commission.

(5) The project does not affect a Government dam, nor will the issuance of a license therefor, as hereinafter provided, affect the development of any water resources for public purposes which should be undertaken by the United States.

(6) Subject to the terms and conditions hereinafter imposed, the project will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial public uses, including recreational purposes.

(7) The installed horsepower capacity of the project hereinafter authorized for the purpose of computing the capacity component of the administrative annual charge is 367 horsepower, and the amount of annual charges, based on

such capacity, to be paid under the license for the project, for the costs of administration of Part I of the Act is reasonable as hereinafter fixed and specified.

(8) It will be in the public interest to waive pursuant to Section 10(i) of the Act the terms and conditions contained in the following sections of Part I of the Act:

Sections 4(b), except the second sentence thereof; 4(e), insofar as it relates to approval of plans by the Chief of Engineers and the Secretary of the Army and to public notice; 6, insofar as it relates to public notice and to the acceptance and expression in the license of terms and conditions of the Act which are hereinafter waived; 10(c), insofar as it relates to depreciation reserves; 10(d); 10(f); 11; 12; 14, except insofar as the power of condemnation is reserved; 15; 18, except insofar as it relates to fishways; 19; 20; 22; and 23(a), insofar as it relates to the determination of fair value.

The Commission orders:

(A) This license is hereby issued to Vermont Marble Company (Licensee) of Proctor, Vermont, under Sections 4(e) and 10(i) of the Federal Power Act (Act) for a period effective as of April 1, 1962, and terminating December 31, 1993, for the continued operation and maintenance of Project No. 2445, located on Otter Creek, a navigable water of the United States, in Rutland, Rutland County, Vermont, subject to the terms and conditions of the Act insofar as not expressly waived herein, which Act is incorporated herein by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Center Rutland Project No. 2445 consists of:

(i) all lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined; and

(ii) a stone masonry and concrete dam of an average height of 12 feet with, normally, 1 foot 6 inches of wood flashboards; a small pond behind the dam; a forebay approximately 30 feet wide and 80 feet long; a 6-foot diameter steel penstock about 75 feet long; a one-story marble masonry powerhouse about 33 feet by 40 feet; one horizontal shaft generating unit, the generator of which is rated at 275 kw; and all other structures, fixtures, equipment or facilities used or useful in the maintenance and operation of the project and located on the project area, and all rights, and interests the possession of which is necessary or appropriate in the maintenance and operation of the project.

(C) This license is also subject to the terms and conditions set forth in Form L–9 (July 1, 1964) entitled, "Terms and Conditions of License for Constructed Minor Project Affecting Navigable Waters of the United States" (32 FPC 577), which terms and conditions, designated as Articles 1 through 11, are attached hereto and made a part hereof; and subject to the following special conditions set forth herein as additional articles:

Article 12. The Licensee shall pay to the United States the following annual charge, effective as of April 1, 1962:

(i) For the purpose of reimbursing the United States for the costs of administration of Part I of the Act, $18.00.

Article 13. On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply for steam-electric, irrigation, industrial, municipal or similar purposes consistent with the primary objective of the project. The Licensee shall receive such rea-

sonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the Applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

(D) The terms and conditions of the Act, which it has been found above to be in the public interest to waive, are hereby excluded from this license.

(E) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgment of the acceptance of this license, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

BROWN-NEW HAMPSHIRE, INC., PROJECT NO. 2423

ORDER ISSUING LICENSE (MAJOR)

(Issued August 20, 1965)

Application was filed on November 1, 1963 by Brown Company, of Berlin, New Hampshire, for a license under Section 4(e) of the Federal Power Act (Act) for constructed hydroelectric Project No. 2423, known as the Riverside Project, located on the Androscoggin River, navigable waters of the United States, in the City of Berlin, Coos County, New Hampshire. No lands of the United States are affected by the project.

In its order issued April 22, 1965, in Docket No. E-7212, 33 FPC 843, the Commission authorized the sale of certain electric facilities, including all hydroelectric plants, from Brown Company to Brown-New Hampshire, Inc., and such acquisition was consummated on April 30, 1965. As a consequence, Brown-New Hampshire, Inc., at its request, has been substituted as the Applicant for Project No. 2423.

The original dam and powerhouse, constructed in 1920–1921, included three 5,000 horsepower vertical turbines directly connected to three 3,800 kilowatt generators. There have been no substantial alterations to the project since 1921.

For the reasons set forth in our April 25, 1962, Opinion No. 357 (27 FPC 830), the license herein granted shall have an effective date of July 1, 1958, and a terminating date of December 31, 1993.

The Chief of Engineers and the Secretary of the Army have advised that the plans of the project structures affecting navigation have been approved insofar as the interests of navigation are concerned.

The Secretary of the Interior, in reporting on the application, recommended for inclusion in any license for the project certain conditions in the interests

of fish and wildlife and recreational resources usually included in licenses for such projects.

The Department of Health, Education, and Welfare, has recommended that any license for the project include a provision for review and possible revision of flow requirements when the effects of possible future installation of adequate treatment of water in the Androscoggin River can be determined. This provision is included herein as Article 33.

The State Planning Project, State of New Hampshire, has advised that, due to water pollution, the project is not suitable for any recreational development, but that at some future date, depending upon the abatement of such pollution, there may be some limited recreational development. No conditions were recommended for inclusion in any license for the project. By Article 31 herein we are requiring Applicant to cooperate with State and local agencies in the interest of recreation in connection with the use of project lands and waters by the public and to keep us advised at stated intervals with respect to the results of such cooperation.

The only transmission facility considered by Applicant as part of the project works is a 2.3 kv to 22 kv stepup substation facility. In Article 32 herein we are reserving the Commission's right to determine at a later date what additional transmission facilities, if any, shall be included in this license.

The Commission finds:

(1) The project is located upon navigable waters of the United States.

(2) Applicant is a corporation organized under the laws of the State of New Hampshire, and has submitted satisfactory evidence of compliance with the requirements of all applicable State laws insofar as necessary to effectuate the purposes of a license for the project.

(3) Public notice of the filing of the application has been given. No protests or petitions to intervene have been received. No conflicting application is before the Commission.

(4) The project does not affect a Government dam, nor will the issuance of a license therefor, as hereinafter provided, affect the development of any water resources for public purposes which should be undertaken by the United States.

(5) Subject to the terms and conditions hereinafter imposed, the project will be best adapted to a comprehensive plan for improving or developing a waterway or waterways for the use or benefit of interstate or foreign commerce, for the improvement and utilization of water-power development, and for other beneficial public uses, including recreational purposes.

(6) The installed horsepower capacity of the project hereinafter authorized for the purpose of computing the capacity component of the administrative annual charge is 15,200 horsepower, and the amount of annual charges, based on such capacity, to be paid under the license for the project, for the costs of administration of Part I of the Act is reasonable.

(7) The exhibits designated and described in paragraph (B) below, including Exhibit J which contains information usually shown on Exhibit K, conform to the Commission's rules and regulations and should be approved as part of this license.

The Commission orders:

(A) This license is hereby issued to Brown-New Hampshire, Inc., (Licensee) of Berlin, New Hampshire, under Section 4(e) of the Federal Power Act (Act), for a period effective as of July 1, 1958, and terminating December 31, 1993, for the continued operation and maintenance of Riverside Project No. 2423, located on the Androscoggin River, a navigable water of the United States in

the State of New Hampshire, subject to the terms and conditions of the Act which is incorporated herein by reference as a part of this license, and subject to such rules and regulations as the Commission has issued or prescribed under the provisions of the Act.

(B) Riverside Project No. 2423 consists of:

(i) All lands constituting the project area and enclosed by the project boundary or the limits of which are otherwise defined, and/or interest in such lands necessary or appropriate for the purposes of the project, whether such lands or interest therein are owned or held by the Licensee or by the United States; such project area and project boundary being more specifically shown and described by a certain exhibit which formed part of the application for license and which is designated and described as follows:

Exhibit J: Sheet 1 of 2 (FPC No. 2423–1) Plan View of Project Area.

(ii) Project works consisting of:

(1) A dam approximately 802 feet long, including a rock filled timber crib section about 329 feet long extending about 131 feet diagonally downstream from the left bank (including a sluiceway about 14 feet wide) and about 198 feet generally downstream, a concrete ogee section about 235 feet long and a timber crib section (topped with flashboards about 2 feet high) about 200 feet long extending further downstream to a sluice gate section (2 gates, each 6 feet wide) adjacent to the gatehouse; (2) a gatehouse, adjacent to the right bank; (3) three wood stave penstocks 13 feet in diameter and approximately 1,250 feet long; (4) a powerhouse on the right bank containing three 5,000 hp turbines direct connected to three 3,800 kw generators; (5) a substation; and (6) appurtenant facilities; the location, nature and character of which are more specifically shown and described by the exhibit hereinbefore cited and by certain other exhibits which also formed part of the application for license and which are designated and described as follows:

Exhibit L	FPC No.	Showing Riverside hydroelectric development
Sheet 1	2423-3	Plan view of gatehouse and dam.
Sheet 2	2423-4	Plan view of penstocks and station.
Sheet 3	2423-5	Elevations of gatehouse.
Sheet 4	2423-6	Elevations of station.
Sheet 5	2423-7	Section of gatehouse.
Sheet 6	2423-8	Sections of station.
Sheet 7	2423-9	Plan view, operating floor, gatehouse.
Sheet 8	2423-10	Plan view of operating floor, station.

Exhibit M: Thirteen typewritten pages, "General Description of Mechanical, Electrical, and Transmission Equipment", filed in the Commission November 1, 1963.

(iii) All of the structures, fixtures, equipment or facilities used or useful in the maintenance and operation of the project and located on the project area, including such portable property as may be used or useful in connection with the project or any part thereof, whether located on or off the project area, if and to the extent that the inclusion of such property as part of the project is approved or acquiesced in by the Commission; also, all riparian or other rights, the use or possession of which is necessary or appropriate in the maintenance or operation of the project.

(C) This license is also subject to the terms and conditions set forth in Form L–3 (Revised August 1, 1964) entitled "Terms and Conditions of License for Constructed Project Affecting Navigable Waters of the United States" (32 FPC 1114) which terms and conditions, designated as Articles 1 through 29, are

attached hereto and made a part hereof, except Article 25 thereof, and subject to the following special conditions set forth herein as additional articles:

Article 30. The Licensee shall pay to the United States the following annual charge, effective July 1, 1958:

For the purpose of reimbursing the United States for the costs of administration of Part I of the Act, a reasonable annual charge as determined by the Commission in accordance with the provisions of its regulations, in effect from time to time. The authorized installed capacity for such purposes is 15,200 horsepower.

Article 31. Licensee shall cooperate with State and local agencies in the development and maintenance of access areas and roads and such other facilities necessary for full recreational utilization by the public of project lands and waters, consistent with the terms of the license and the operation of the project. At the end of three (3) years from the date of issuance of this license and every fifth year, thereafter, Licensee shall advise the Commission of the results of cooperation with State and local agencies and of further recreation development at the project.

Article 32. The Commission reserves the right to determine at a later date what additional transmission facilities, if any, shall be included in this license.

Article 33. The Licensee shall cooperate with the appropriate Federal and State agencies in any necessary and/or desirable review and revision of flow requirements in connection with the pollution of the Androscoggin River by municipal and industrial wastes.

Article 34. On the application of any person, association, corporation, Federal agency, State or municipality, the Licensee shall, after notice and opportunity for hearing, permit such reasonable use of its reservoirs or other project works or parts thereof as may be ordered by the Commission in the interest of comprehensive development of the waterway or waterways involved and the conservation and utilization of water resources of the region for water supply for steam electric, irrigation, industrial, municipal or similar purposes, consistent with the primary objective of the project. The Licensee shall receive such reasonable compensation as may be appropriate for use of its reservoirs or other project works or parts thereof for such purposes, any such compensation to be fixed either by Commission approval of an agreement between the Licensee and the party or parties benefiting or by the Commission in the event the parties are unable to agree. Applications shall contain information in sufficient detail to afford a full understanding of the proposed use, including satisfactory evidence that the applicant possesses necessary water rights pursuant to applicable State law, or a showing of cause why such evidence cannot be submitted, and a statement as to the relationship of the proposed use to any State or municipal plans or orders which may have been adopted with respect to the use of such waters.

(D) The exhibits designated and described in paragraph (B) above are hereby approved as part of this license.

(E) This order shall become final 30 days from the date of its issuance unless application for rehearing shall be filed as provided in Section 313(a) of the Act, and failure to file such an application shall constitute acceptance of this license. In acknowledgment of the acceptance of this license, it shall be signed for the Licensee and returned to the Commission within 60 days from the date of issuance of this order.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

CAROLINA PIPELINE COMPANY, COMPLAINANT v. SOUTHERN NATURAL GAS COMPANY, DEFENDANT, DOCKET NO. RP63–4

ORDER CONDITIONALLY APPROVING SETTLEMENT AGREEMENT PRESCRIBING TARIFF CHANGES AND TERMINATING PROCEEDING

(Issued August 20, 1965)

On June 9, 1965, the parties participating in the hearing in this remanded proceeding submitted on the record a proposal for the settlement of the matters in issue (Tr. 836–838). That proposal, certified to the Commission by the Presiding Examiner on June 9, 1965, is now before us for consideration and action.

This proceeding relates to a formal complaint filed by Carolina Pipeline Company (Carolina) against Southern Natural Gas Company (Southern) alleging discriminations in allocations of overrun gas and improper classification as a customer under Southern's CDL–AOL rate schedules. The Commission's dismissal of the complaint by Opinion No. 423, issued March 30, 1964, 31 FPC 705, was appealed by Carolina to the United States Court of Appeals for the District of Columbia. Thereafter, the case was remanded to the Commission, at its request, for further consideration.

The terms of the proposed settlement as set out in the record of the reopened proceeding are as follows:

The parties hereto, after informal conferences on April 27 and June 8, 1965, have agreed that this proceeding shall be terminated upon the following terms:

1. Southern shall make the following changes in its FPC Gas Tariff to be effective as soon as is feasible after the giving of appropriate notice.

A. The availability sections of the OCDL Rate Schedules shall be changed to read:

1. Availability: This rate schedule is available to an interstate natural gas pipeline company (whether or not it is also a distributor) (hereinafter called Purchaser) which obtains natural gas from one or more other sources, for the purchase, for resale, from Southern Natural Gas Company (hereinafter called Company) of natural gas at such delivery points, located in the above named rate zone, as may be agreed to from time to time, and set out in the contract between Company and Purchaser.

B. Section 9 of the General Terms and Conditions shall be changed by changing the period at the end of the next to last sentence to a semicolon and adding:

provided, that excess gas so available to resale customers shall, during the periods October 15 to April 1, be divided among such customers (to the extent that the Company's pipeline system is capable of delivering such quantities) in proportion to their respective Contract Demands or Maximum Delivery Obligations, each such customer desiring additional excess being eligible to receive pro rata the unused portion of the share of another. For the purpose of such division of excess gas among resale customers, the total of the Contract Demands for delivery points which have been grouped in an Exhibit A to an executed Service Agreement, shall be considered as a single Contract Demand separate from the Contract Demands for other groups.

C. A new rate schedule, available in each of Southern's zones providing for overrun service to OCD customers, shall be filed. The rates for such service shall be the same rates as are now being charged for such service. At such

time as Southern makes a general change in its rates, it will give serious consideration to establishing overrun rates which would be higher than the rates now being charged for overrun service.

2. Upon request by the Commission's staff, Southern will furnish to the Staff such data concerning deliveries of excess and interruptible gas as the Staff shall specify.

3. Upon approval by the Commission of this Stipulation and the becoming effective of the above-tariff changes, Carolina Pipeline Company and Southern will execute a new Exhibit A to their service agreement which will provide for service under Rate Schedule OCD–3.

4. This stipulation is submitted as a package, and the agreement of all parties hereto, who note their agreement, is contingent upon the approval by the Commission of all portions of the stipulation. Upon the granting of such approval this proceeding shall be terminated.

Following issuance of notice of the proposed agreement and publication thereof in the Federal Register (30 F.R. 8866), six parties filed comments thereon.

Alabama Gas Corporation, Mississippi Valley Gas Company and South Georgia Natural Gas Company in their separate comments object only to the sentence in paragraph (C) of the proposal which states, "At such time as Southern makes a general change in its rates, it will give serious consideration to establishing overrun rates which would be higher than the rates now being charged for overrun service." South Carolina Natural Gas Company states that it does not object to the proposed settlement provided it is conditioned to require Southern to make monthly reports to the Commission showing the minimum daily delivery pressures at Aiken, South Carolina. Carolina Pipeline Company supports the settlement and states that any present concern regarding increased overrun rates is premature and irrelevant to the settlement. Southern supports the proposal and has advised that it has no objection to the condition proposed by South Carolina.

The aforementioned objections to the last sentence of paragraph (C) of the settlement are premature. Any rate increase filing contemplated thereby is conjectural and remote and we are not now determining the reasonableness of such filing or that the present method of charging for overrun service is inappropriate.

It is our view that the proposed settlement is a reasonable resolution of the issues in this proceeding and should be approved as hereinafter provided.

The Commission finds:

(1) The settlement of this proceeding upon the basis of the proposal set out above and in the record is reasonable, proper and in the public interest and should be approved and be made effective subject to the terms and conditions hereinafter prescribed.

(2) Good cause exists for terminating these proceedings, subject to the terms and conditions hereinafter ordered.

The Commission orders:

(A) Within thirty (30) days from the date of issuance of this order, Southern shall file the revised tariff sheets necessary to effectuate the changes in its FPC Gas Tariff prescribed in the settlement, subject to the Commission's approval.

(B) Upon acceptance thereof, evidenced by letter from the Secretary of the Commission addressed to Southern, such tariff sheets shall become effective as of the date requested by Southern, but not later than October 15, 1965.

(C) Carolina and Southern shall execute and file on or before October 15, 1965, a new Exhibit A to their service agreement which will provide for service to Carolina under Rate Schedule OCD–3 beginning on the date said new tariff sheets become effective.

(D) Beginning with the effective date of tariff sheets to be filed hereunder, and thereafter until notified by letter from the Secretary to discontinue, Southern shall file a monthly report of the minimum delivery pressure maintained at its Aiken delivery point on each day and shall make such reports available for inspection by interested parties.

(E) The proceedings in Docket No. RP63–4 are terminated subject to the terms and conditions contained in the aforesaid settlement and the terms and conditions of this order.

(F) This order and the termination of these proceedings as hereinbefore provided are without prejudice to any findings or orders which have been or may hereafter be made by the Commission, and is without prejudice to any claims or contentions which may be made by the Commission, Southern, or any other party hereto in any other proceeding or proceedings now pending or hereafter instituted by or against Southern or any other person.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

COASTAL STATES GAS PRODUCING COMPANY, ET AL., DOCKET NO. G–19653

ORDER ACCEPTING OFFER OF SETTLEMENT, REQUIRING FILING OF NOTICE OF CHANGE, REQUIRING REFUNDS AND TERMINATING PROCEEDING

(Issued August 20, 1965)

On July 19, 1965, Coastal States Gas Producing Company (Coastal) submitted an offer of settlement, pursuant to Section 1.18(e) of the Commission's Rules of Practice and Procedure, involving sales of natural gas to Tennessee Gas Transmission Company (TGT) under Coastal's FPC Gas Rate Schedule No. 26 in Victoria County, Texas (Texas R.R. Com. District #2). Under the terms of the offer, Coastal proposes to eliminate the favored-nation, price redetermination and periodic price escalation provisions from the rate schedule, and to establish a 15.0¢ per Mcf rate for the subject sale.[1] With its offer, Coastal filed an executed amendatory agreement effectuating the terms of its proposal.[2] No protests or objections have been filed to the offer.

Under the proposed settlement, Coastal's annual revenues would be decreased $2,650 and refunds would approximate $4,950, exclusive of interest.

The proposed settlement is consistent with the provisions of the Second Amendment to the Commission's Statement of General Policy No. 61–1, issued December 20, 1960, 24 FPC 1107, as amended by Order No. 264, issued March 27, 1963, 29 FPC 589, and its acceptance would serve the public interest.

However, we desire to make it clear that acceptance of Coastal's offer of settlement shall not be construed as approval of any future increased rate filed in accordance with its reservation of the right to file tax increases under the subject

[1] The settlement rate includes a 0.21931¢ per Mcf dehydration deduction for the delivery of non-dehydrated gas.

[2] The amendatory agreement is designated herein as Supplement No. 11 to Coastal's FPC Gas Rate Schedule No. 26.

rate schedule, and without prejudice to any findings or order of the Commission in any future proceedings including area rate or other similar proceedings, involving Coastal's rates and rate schedules.

The Commission finds:

The proposed settlement of the above-designated proceeding on the basis described herein, as more fully set forth in the offer of settlement filed with the Commission by Coastal on July 19, 1965, is in the public interest and appropriate to carry out the provisions of the Natural Gas Act and should be approved and made effective as hereinafter ordered.

The Commission orders:

(A) The offer of settlement filed with the Commission by Coastal on July 19, 1965, is hereby approved in accordance with the provisions of this order.

(B) Supplement No. 11 to Rate Schedule No. 26, filed by Coastal with the offer of settlement herein on July 19, 1965, is accepted for filing, and the settlement rate and charge of 15.0¢ per Mcf at 14.65 psia, subject to the 0.21931¢ per Mcf dehydration deduction, shall be effective as of the date of issuance of this order, and within 30 days from the issuance of this order Coastal shall file a notice of change to reflect such settlement rate.

(C) Coastal shall compute the difference between the rate collected subject to refund and the settlement rate of 15.0¢ per Mcf at 14.65 psia, subject to the applicable dehydration deduction, with applicable interest, to the date of this order, and shall within 30 days from the date of this order submit a report to the Commission, and serve a copy on TGT setting out the amount of refund related to the subject rate schedule (showing separately the principal and applicable interest). Within 10 days thereafter, Coastal shall file TGT's written concurrence in the refund amounts computed in compliance with the above, and shall within 10 days of such filing make refund to TGT of such amounts of monies.

(D) The proceeding in Docket No. G–19653 is severed from the Texas Gulf Coast Area proceeding, Docket No. AR64–2, and is terminated.

(E) The acceptance by the Commission of Coastal's offer of settlement and the termination of Docket No. G–19653 are without prejudice to any findings or determinations that may be made in any proceeding now pending, or hereafter instituted by or against Coastal, including area rate or other similar proceedings.

Before Commissioners: L. J. O'Connor, Jr., Acting Chairman; Charles R. Ross and Carl E. Bagge.

GEORGE H. COATES, ET AL., DOCKET NOS. G–19824 AND RI61–369

ORDER CONDITIONALLY ACCEPTING OFFER OF SETTLEMENT REQUIRING FILING OF NOTICE OF CHANGE AND CONTRACT AMENDMENT, REQUIRING REFUNDS AND TERMINATING PROCEEDINGS

(Issued August 20, 1965)

On July 8, 1965, George H. Coates, *et al.* (Coates) filed an offer of settlement in these proceedings pursuant to Section 1.18(e) of the Commission's Rules of Practice and Procedure, involving the sale of natural gas to Tennessee Gas Transmission Company (TGT) in the San Salvador Field, Hidalgo County, Texas Railroad Commission District No. 4 under its FPC Gas Rate Schedule No. 2. The settlement involves proposed rate increases which were filed by Coates, the first in Docket No. G–19824 from 12.12268¢ to 15.0952¢ per Mcf of natural

gas at 14.65 psia which was suspended by the Commission for the statutory period and made effective by Coates by appropriate motion, and the second to 17.24347¢ per Mcf, which was likewise suspended and made effective, subject to refund.

Under the terms of the settlement offer, Coates proposes to reduce its rate for the subject sale from the 17.24347¢ rate now in effect, subject to refund, to 15.0¢ per Mcf at 14.65 psia, and to delete the price escalation provisions from the subject rate schedule. Additionally, Coates proposes to refund the monies it has collected subject to refund to June 1, 1965, which date it states it will make the settlement rate effective. However, we find no good cause to depart from the established policy of making the settlement rate effective as of the date of the order approving the same, and requiring refunds to such date. Therefore, we shall condition our acceptance of Coates' proposal to require it to file a notice of change of rate and to make refunds, with applicable interest, to the date of issuance of this order. As so conditioned, Coates rates will be reduced approximately $7,086.00 below the currently effective rate, and it will refund to TGT approximately $32,416.00, with applicable interest.

We desire to make it clear that acceptance of Coates' offer of settlement shall not be construed as approval of any future increased rate filed in accordance with its reservation of the right to file increases to cover future tax increases as provided in its offer of settlement, and is without prejudice to any findings or order of the Commission in any future proceedings, including area rate or other similar proceedings, involving Coates' rates and rate schedules.

The Commission finds:

The proposed settlement of the above-designated proceedings, on the basis described herein, as more fully set forth in the offer of settlement filed with the Commission by Coates' on July 8, 1965, as herein conditioned, is consistent with the Statement of General Policy No. 61–1, as amended, 18 CFR 2.56, and approval thereof as made effective and hereinafter ordered is in the public interest and is appropriate to carry out the provisions of the Natural Gas Act.

The Commission orders:

(A) The offer of settlement filed with the Commission by Coates on July 8, 1965, as herein conditioned, is approved in accordance with the provisions of this order.

(B) Coates shall file, within 30 days of the issuance of this order, a notice of change in rate providing for the settlement rate of 15.0¢ per Mcf under its Rate Schedule No. 2

(C) Coates shall file within 30 days from the issuance of this order a contract amendment to its Rate Schedule No. 2 eliminating all price escalation provisions therefrom except for future changes in tax reimbursement.

(D) Coates shall compute the difference between the rates collected subject to refund and the settlement rate of 15.0¢ per Mcf for sales to TGT in Docket Nos. G–19824 and RI61–369, with applicable interest to the date of this order, and shall within 45 days from the date of issuance of this order submit a report to the Commission, with a copy to TGT, setting out the amount of refunds (showing separately the principal and applicable interest) the bases used for such determination, the periods covered, and ten days thereafter file a letter from TGT agreeing to the correctness of such amounts, and shall ten days from such filing refund such monies to TGT.

(E) Upon notification by the Secretary of the Commission that Coates has complied with the terms and conditions of this order, the rate and charge of 15.0¢ per Mcf of natural gas under its Rate Schedule No. 2, specified in its offer of settlement, as herein conditioned, shall be effective as of the date
